Document conventions

Style	Description	Example
Danger	A danger notice indicates a situation that will cause major system changes, faults, physical injuries, and other adverse results.	**Danger:** Resetting will result in the loss of user configuration data.
Warning	A warning notice indicates a situation that may cause major system changes, faults, physical injuries, and other adverse results.	**Warning:** Restarting will cause business interruption. About 10 minutes are required to restart an instance.
Notice	A caution notice indicates warning information, supplementary instructions, and other content that the user must understand.	**Notice:** If the weight is set to 0, the server no longer receives new requests.
Note	A note indicates supplemental instructions, best practices, tips, and other content.	**Note:** You can use Ctrl + A to select all files.
>	Closing angle brackets are used to indicate a multi-level menu cascade.	Click **Settings**> **Network**> **Set network type**.
Bold	Bold formatting is used for buttons , menus, page names, and other UI elements.	Click **OK**.
`Courier font`	Courier font is used for commands	Run the `cd /d C:/window` command to enter the Windows system folder.
Italic	Italic formatting is used for parameters and variables.	`bae log list --instanceid` *Instance_ID*
[] or [a|b]	This format is used for an optional value, where only one item can be selected.	`ipconfig [-all|-t]`
{} or {a|b}	This format is used for a required value, where only one item can be selected.	`switch {active|stand}`

1.Apsara Uni-manager Management Console

1.1. User Guide

1.1.1. What is the Apsara Uni-manager Management Console?

The Apsara Uni-manager Management Console is a service capability platform based on the Alibaba Cloud Apsara Stack platform and designed for government and enterprise customers. This platform improves IT management and troubleshooting and is dedicated to providing a leading service capability platform of the cloud computing industry. It provides large-scale and cost-efficient end-to-end cloud computing and big data services for customers in industries such as government, education, healthcare, finance, and enterprise.

Overview

The Apsara Uni-manager Management Console simplifies the management and deployment of physical and virtual resources by building an Apsara Stack platform that supports various business types of government and enterprise customers. The console helps you build your business systems in a simple and quick manner, fully improve resource utilization, and reduce O&M costs. This allows you to shift your focus from O&M to business. The console brings the Internet economy model to government and enterprise customers, and builds a new ecosystem chain based on cloud computing.

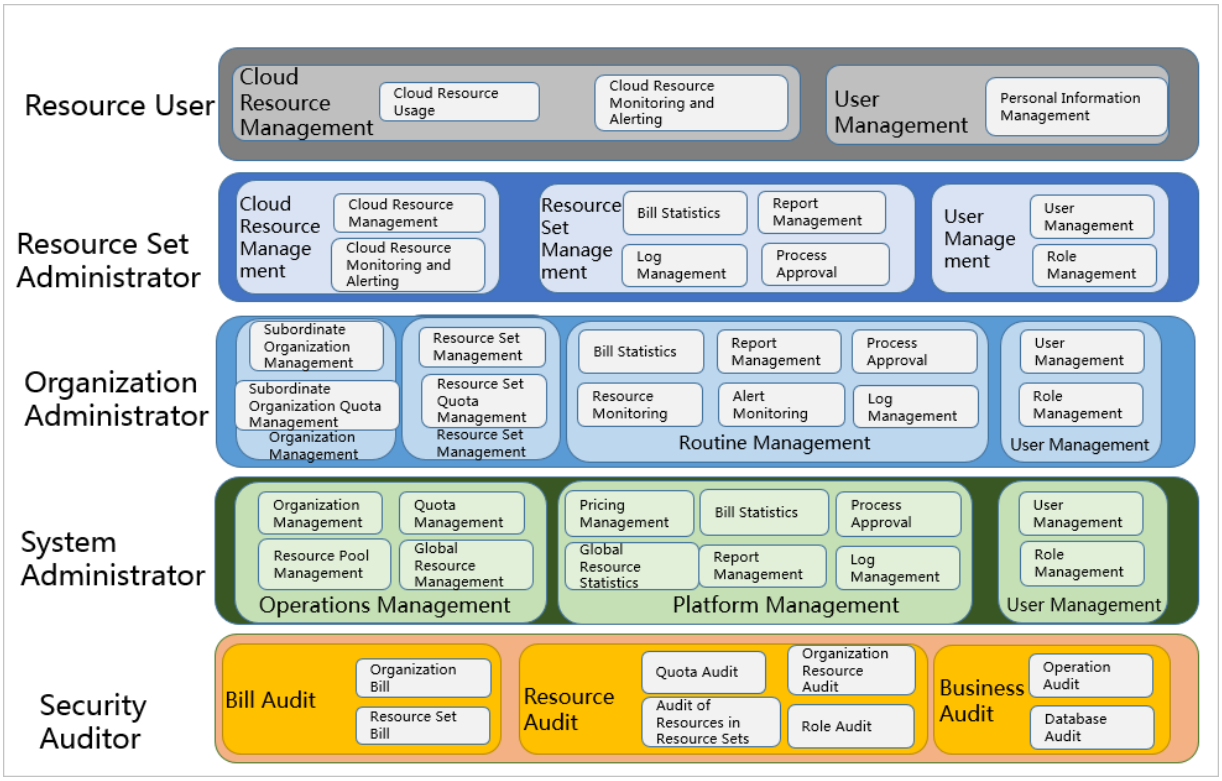
Workflow

Operations in the Apsara Uni-manager Management Console are divided into the following parts:

- System initialization: This part is designed to complete basic system configurations, such as creating organizations, resource sets, and users, creating basic resources such as VPCs, and creating contacts and contact groups in Cloud Monitor.
- Cloud resource creation: This part is designed to create resources.
- Cloud resource management: This part is designed to complete resource management operations, such as starting, using, and releasing resources, and changing resource configurations and resource quotas.

1.1.2. User roles and permissions

This topic describes roles and their permissions.



Roles and permissions

Role	Role permission
Resource user	This role has permissions to view and modify resources in a resource set and create alert rules.
Resource set administrator	This role has permissions to create, modify, and delete resources in a resource set and manage the users of the resource set.
Organization administrator	This role has permissions to manage an organization and its subordinate organizations, create, modify, and delete the resources of organizations, create and view alert rules for resources, and export reports.
Operations administrator	This role has read and write permissions on all resources.
Security auditor	This role performs security audits on the Apsara Uni-manager Management Console and has read-only permissions on the operation logs of the Apsara Uni-manager Management Console.
Platform administrator	This role has permissions to initialize the system and create operations administrators.
Resource auditor	This role has read-only permissions on all resources in the Apsara Uni-manager Management Console.
Organization security administrator	This role manages the security of an organization, including the security of hosts, applications, and networks. This role has read-only permissions on the operation logs of the Apsara Uni-manager Management Console and read and write permissions on ApsaraDB RDS, Elastic Compute Service (ECS), and Apsara Stack Security.

Role	Role permission
Security system configuration administrator	This role configures system security features such as the upgrade center and global configurations. This role has read and write permissions on the upgrade, protection, and configuration features of Apsara Stack Security.
Global organization security administrator	This role manages the security of global tenants and the platform by using Cloud Security Operation Center (SOC). This role has read and write permissions on RDS, ECS, and Apsara Stack Security.
Platform security administrator	This role manages the security of the Apsara Uni-manager Management Console by using SOC.
Global organization security auditor	This role checks the security conditions of all organizations by using SOC. This role has read-only permissions on the operation logs of the Apsara Uni-manager Management Console and all features of Apsara Stack Security.
Platform security auditor	This role checks the security conditions of the Apsara Uni-manager Management Console by using SOC. This role has read-only permissions on the operation logs of the Apsara Uni-manager Management Console, Server Guard, Cloud Firewall, Sensitive Data Discovery and Protection, SOC, system configurations, and Web Application Firewall (WAF) configurations. This role also has read and write permissions on Anti-DDoS, Threat Detection, and Update Center of Apsara Stack Security.
Platform security configuration administrator	This role configures security services in the Apsara Uni-manager Management Console, such as Server Guard and WAF, and has read and write permissions on these services.
Organization resource auditor	This role has read-only permissions on all resources in an organization to which it belongs.

1.1.3. Log on to the Apsara Uni-manager Management Console

This topic describes how to log on to the Apsara Uni-manager Management Console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

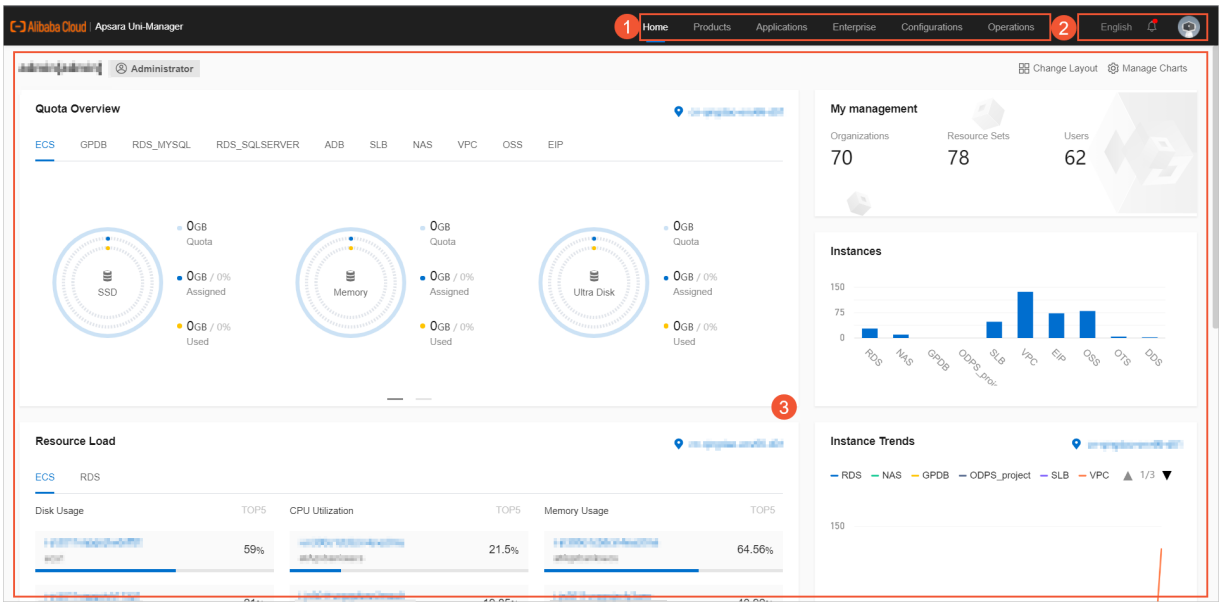
     Enter a six-digit MFA authentication code and click **Authenticate**.

> **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

1.1.4. Web page introduction

The web page of the Apsara Uni-manager Management Console consists of the search box, top navigation bar, information section of the current logon user, and operation section.

Apsara Uni-manager Management Console page



Functional sections of the web page

Section		Description
1	Top navigation bar	This section includes the following modules: • **Home**: uses charts to show the usage and monitoring data of existing system resources in each region. • **Products**: manages all types of basic cloud services and resources. • **Applications**: manages cloud applications of enterprises. • **Enterprise**: manages organizations, resource sets, roles, users, logon policies, user groups, ownership, and resource pools. • **Configurations**: manages resource pools, password policies, specifications, menus, and Resource Access Management (RAM) roles. • **Operations**: manages the routine operations of cloud resources, including usage statistics and quotas. • **Security**: provides operation and system logs.
2	Information section of the current logon user	• English: allows you to switch between English, simplified Chinese, and traditional Chinese. • : provides message notifications. • Personal information: When you click the icon of the current logon user, the **Personal information**, **View version information**, and **Log out** menu items are displayed. If you click **Personal information**, you can perform the following operations on the User Information page: ◦ View basic information. ◦ Modify personal information. ◦ Change the logon password. ◦ View the AccessKey pair of your Apsara Stack tenant account. ◦ Switch the current role. ◦ Enable or disable alert notification. If you click **View version information**, you can view the authorization status and build number of the Apsara Uni-manager Management Console.
3	Operation section	**Operation section**: shows the information and operations.

1.1.5. Initial configuration

1.1.5.1. Configuration description

Before you use the Apsara Uni-manager Management Console, you must complete a series of basic configuration operations as an administrator, such as creating organizations, resource sets, users, and roles and initializing resources. This is the initial system configuration.

The Apsara Uni-manager Management Console manages the organizations, resource sets, users, and roles of cloud data centers in a centralized and service-oriented manner to grant different resource access permissions to different users.

- Organization

After the Apsara Uni-manager Management Console is deployed, a root organization is automatically generated. You can create other organizations under the root organization.

Organizations are displayed in a hierarchical structure. You can create subordinate organizations under each organization level.

- Resource Set

  A resource set is a container used to store resources. Each resource must belong to a resource set.

- User

  A user is a resource manager and user.

- Role

  A role is a set of access permissions. You can assign different roles to different users to implement system access control to meet a variety of different requirements.

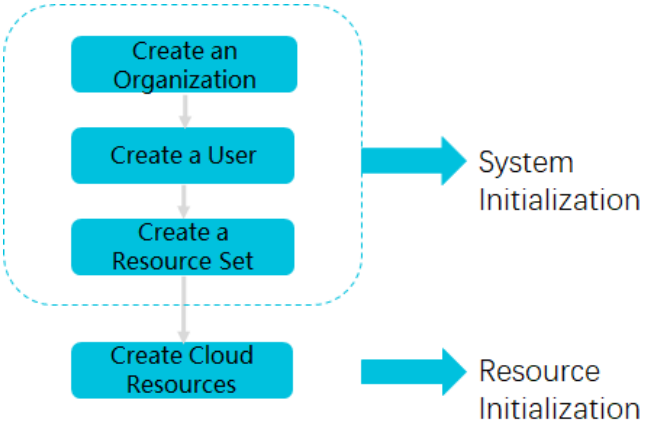
The following table describes the relationships among organizations, resource sets, users, roles, and cloud resources.

Relationship between two items	Relationship type	Description
Organization and resource set	One-to-many	An organization can have multiple resource sets, but each resource set can belong to only a single organization.
Organization and user	One-to-many	An organization can have multiple users, but each user can belong to only a single organization.
Resource set and user	Many-to-many	A user can have multiple resource sets, and a resource set can be assigned to multiple users under the same level-1 organization.
User and role	Many-to-many	A user can have multiple roles, and a role can be assigned to multiple users.
Resource set and resource	One-to-many	A resource set can have multiple resources, but each cloud resource can belong to only a single resource set.

1.1.5.2. Configuration process

This topic describes the initial configuration process.

Before you use the Apsara Uni-manager Management Console, you must complete the initial system configurations as an administrator based on the process shown in the following figure.



1. Create an organization

Create an organization to store resource sets and their resources.

2. Create a user

   Create a user and assign the user different roles to meet different requirements for system access control.

3. Create a resource set

   Create a resource set before you apply for resources.

4. Create cloud resources

   Create instances in each service console based on project requirements. For more information about how to create cloud service instances, see the user guide of each cloud service.

1.1.6. Monitoring

1.1.6.1. View the workbench

The Apsara Uni-manager Management Console uses charts to keep you up to date on the current usage and monitoring information of resources.

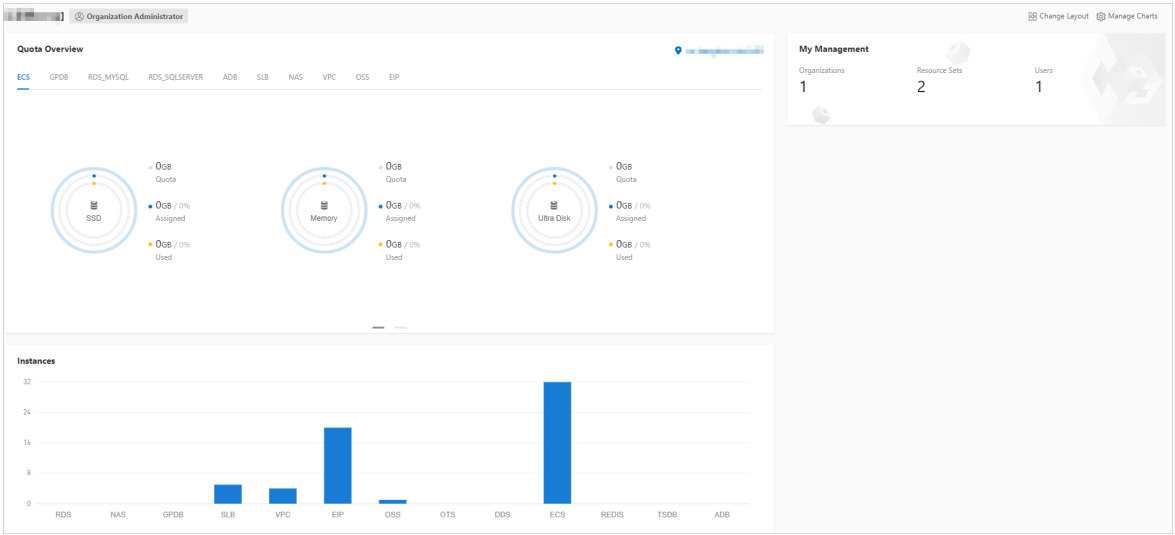
Context

The resource types displayed may vary with region types. See your dashboard for available resource types.

Procedure

1. Log on to the Apsara Uni-manager Management Console.

   By default, the **workbench** page appears when you log on to the Apsara Uni-manager Management Console. To return to the workbench page from other pages, click **Home** in the top navigation bar.



2. On the **workbench** page, you can view the instance summary information for all regions of the Apsara Stack environment.

   You can click **Manage Charts** in the upper-right corner of the page to select all or individual modules to view relevant information. You can also click **Change Layout** in the upper-right corner of the page and drag a specific module to the desired location.

   - **Quota Overview**

     Shows the usage and quotas of Elastic Compute Service (ECS), ApsaraDB RDS, Object Storage Service (OSS), and Server Load Balancer (SLB) resources.

   - **Instances**

Shows the numbers of ECS instances, ApsaraDB RDS instances, OSS buckets, and SLB instances in each region.

- **Instance Trends**

  Shows the numbers of recent ECS instances, ApsaraDB RDS instances, OSS buckets, and SLB instances.

- **Resource Load**

  Shows the top five ECS and ApsaraDB RDS instances in terms of disk usage, CPU utilization, and memory usage.

- **Alert Rules**

  Shows the number of alerts and details of the alerts.

- **My Management**

  Shows the numbers of organizations, resource sets, and users.

- **Multi-cloud Regions**

  Shows the information of all primary and secondary nodes in Apsara Stack. The network connection status and related alerts are displayed for each secondary node.

- **Multi-cloud Resources**

  Shows the cloud services and the number of instances in each secondary node.

1.1.6.2. Configure the workbench

If your homepage is the default homepage, you can customize the dashboards for the homepage.

Background information

If Default Homepage is selected on the Menu Permissions tab of your role, no dashboards are displayed in the workbench on the homepage. You can manually configure a URL to be displayed on the homepage.

> **Note**
>
> This URL supports only domain names of the oneconsole type. You can view and access a URL only by using the account and the role that are used to specify the URL. For more information, see Create a menu.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click Home.
3. Click **Configure Iframe**.
4. Enter a URL in the field.
5. Click **OK**.

1.1.6.3. CloudMonitor

1.1.6.3.1. Cloud Monitor overview

Cloud Monitor provides real-time monitoring, alerting, and notification services for resources to protect your services and businesses.

Cloud Monitor can monitor metrics for a variety of services such as ECS, ApsaraDB RDS, SLB, OSS, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, and API Gateway.

You can use the metrics of cloud services to configure alert rules and notification policies. This way, you can stay up to date on the running status and performance of your service instances and scale resources in a timely manner when resources are insufficient.

1.1.6.3.2. Metrics

This topic describes the metrics available for each service.

CloudMonitor checks the availability of services based on their metrics. You can configure alert rules and notification policies for these metrics to stay up to date on the running status and performance of monitored service instances.

CloudMonitor can monitor resources of other services, including Elastic Compute Service (ECS), ApsaraDB RDS, Server Load Balancer (SLB), Object Storage Service (OSS), KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Elastic IP Address (EIP), and API Gateway. The following tables list the metrics for each service.

Operating system metrics for ECS

Metric	Description	Unit
Host.cpu.total	The total CPU utilization of an ECS instance.	%
Host.mem.usedutilization	The memory usage of an ECS instance.	%
Host.load1	The system loads over the last 1 minute. This metric is unavailable for Windows operating systems.	N/A
Host.load5	The system loads over the last 5 minutes. This metric is unavailable for Windows operating systems.	N/A
Host.load15	The system loads over the last 15 minutes. This metric is unavailable for Windows operating systems.	N/A
Host.disk.utilization	The disk usage of an ECS instance.	%
Host.disk.readbytes	The number of bytes read from the disk per second.	byte/s
Host.disk.writebytes	The number of bytes written to the disk per second.	byte/s
Host.disk.readIops	The number of read requests received by the disk per second.	count/s
Host.disk.writeIops	The number of write requests received by the disk per second.	count/s
Host.fs.inode	The inode usage.	%

Basic metrics for ECS

Metric	Description	Unit
CPU utilization	The CPU utilization of an ECS instance.	%

Metric	Description	Unit
Inbound bandwidth to the Internet	The average rate of inbound traffic to the Internet.	bit/s
Inbound bandwidth to the internal network	The average rate of inbound traffic to the internal network.	bit/s
Outbound bandwidth from the Internet	The average rate of outbound traffic from the Internet.	bit/s
Outbound bandwidth from the internal network	The average rate of outbound bandwidth from the internal network.	bit/s
System disk BPS	The number of bytes read from and written to the system disk per second.	byte/s
System disk IOPS	The number of reads from and writes to the system disk per second.	count/s
Advance CPU credits	The changes in advance CPU credits. Advance CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit consumption	The changes in CPU credit consumption. Consumption trends are consistent with CPU utilization.	N/A
Overdrawn CPU credits	The changes in overdrawn CPU credits. Overdrawn CPU credits can be used only when the unlimited mode is enabled.	N/A
CPU credit balance	The changes in CPU credit balance. The CPU credit balance is used to maintain CPU credit usage.	N/A

> **Note**
>
> For ECS instances, you must install a monitoring plug-in to collect metric data at the operating system level.
>
> Installation method: On the **Cloud Monitor** page, select the instance that you want to monitor from the ECS instance list and click **Batch Install** in the lower part of the page.
>
> Metric data is displayed in the monitoring chart within 5 to 10 minutes after the monitoring plug-in is installed.

Metrics for ApsaraDB RDS for PostgreSQL

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used CPU cores of an ApsaraDB RDS for PostgreSQL instance/Total CPU cores of the ApsaraDB RDS for PostgreSQL instance

Metric	Description	Apsara Stack service	Formula
Memory usage	The memory usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	Used memory of an ApsaraDB RDS for PostgreSQL instance/Total memory of the ApsaraDB RDS for PostgreSQL instance
Disk usage	The disk usage of an ApsaraDB RDS for PostgreSQL instance. Unit: %.	ApsaraDB RDS for PostgreSQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of I/O requests for an ApsaraDB RDS for PostgreSQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for PostgreSQL instance per second. Unit: %.	ApsaraDB RDS for PostgreSQL	Number of connections between an application and an ApsaraDB RDS for PostgreSQL instance/Statistical period

Metrics for ApsaraDB RDS for MySQL

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used CPU cores of an ApsaraDB RDS for MySQL instance/Total CPU cores of the ApsaraDB RDS for MySQL instance
Memory usage	The memory usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	Used memory of an ApsaraDB RDS for MySQL instance/Total memory of the ApsaraDB RDS for MySQL instance
Disk usage	The disk usage of an ApsaraDB RDS for MySQL instance. Unit: %.	ApsaraDB RDS for MySQL	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of I/O requests for an ApsaraDB RDS for MySQL instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for MySQL instance per second. Unit: %.	ApsaraDB RDS for MySQL	Number of connections between an application and an ApsaraDB RDS for MySQL instance/Statistical period
Inbound bandwidth to ApsaraDB RDS for MySQL	The inbound traffic to an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None
Outbound bandwidth from ApsaraDB RDS for MySQL	The outbound traffic from an ApsaraDB RDS for MySQL instance per second.	ApsaraDB RDS for MySQL	None

Metrics for ApsaraDB RDS for SQL Server

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used CPU cores of an ApsaraDB RDS for SQL Server instance/Total CPU cores of the ApsaraDB RDS for SQL Server instance
Memory usage	The memory usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	Used memory of an ApsaraDB RDS for SQL Server instance/Total memory of the ApsaraDB RDS for SQL Server instance
Disk usage	The disk usage of an ApsaraDB RDS for SQL Server instance. Unit: %.	ApsaraDB RDS for SQL Server	None
IOPS usage	The number of I/O requests for an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of I/O requests for an ApsaraDB RDS for SQL Server instance/Statistical period
Connection usage	The number of connections between an application and an ApsaraDB RDS for SQL Server instance per second. Unit: %.	ApsaraDB RDS for SQL Server	Number of connections between an application and an ApsaraDB RDS for SQL Server instance/Statistical period
Inbound bandwidth to ApsaraDB RDS for SQL Server	The inbound traffic to an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None
Outbound bandwidth from ApsaraDB RDS for SQL Server	The outbound traffic from an ApsaraDB RDS for SQL Server instance per second.	ApsaraDB RDS for SQL Server	None

Metrics for PolarDB

Metric	Description	Apsara Stack service	Formula
CPU utilization	The CPU utilization of a PolarDB instance. Unit: %.	PolarDB	Used CPU cores of a PolarDB instance/Total CPU cores of the PolarDB instance
Memory usage	The memory usage of a PolarDB instance. Unit: %.	PolarDB	Used memory of a PolarDB instance/Total memory of the PolarDB instance
Disk usage	The disk usage of a PolarDB instance. Unit: %.	PolarDB	None
IOPS usage	The number of I/O requests for a PolarDB instance per second. Unit: %.	PolarDB	Number of I/O requests for a PolarDB instance/Statistical period
Connection usage	The number of connections between an application and a PolarDB instance per second. Unit: %.	PolarDB	Number of connections between an application and a PolarDB instance/Statistical period

Metrics for SLB

Metric	Description	Unit
Inbound bandwidth on a port	The average rate of inbound traffic on a port.	bit/s
Outbound bandwidth on a port	The average rate of outbound traffic on a port.	bit/s
Number of new connections on a port	The average number of new TCP connections established between clients and SLB instances in a statistical period.	N/A
Number of inbound packets received on a port	The number of packets received by an SLB instance per second.	count/s
Number of outbound packets sent on a port	The number of packets sent by an SLB instance per second.	count/s
Number of active connections on a port	The number of TCP connections in the ESTABLISHED state. If persistent connections are used, a connection can transfer multiple file requests at one time.	N/A
Number of inactive connections on a port	The number of TCP connections that are not in the ESTABLISHED state. You can run the **netstat -an** command to view the connections for both Windows and Linux instances.	N/A
Number of concurrent connections on a port	The number of established TCP connections.	count/s
Number of dropped connections on a port	The number of connections dropped per second.	count/s
Number of dropped inbound packets on a port	The number of inbound packets dropped per second.	count/s
Number of dropped outbound packets on a port	The number of outbound packets dropped per second.	count/s
Dropped inbound bandwidth on a port	The amount of inbound traffic dropped per second.	bit/s
Dropped outbound bandwidth on a port	The amount of outbound traffic dropped per second.	bit/s

Metrics for monitoring service overview of OSS

Metric	Description	Unit

Metric	Description	Unit
Availability	The metric that describes the system availability of OSS. You can obtain the metric value based on the following formula: Metric value = `1 - Server error requests with the returned HTTP status code 5xx/All requests`.	%
Valid request percentage	The percentage of valid requests out of all requests.	%
Total number of requests	The total number of requests that are received and processed by the OSS server.	N/A
Number of valid requests	The total number of requests with HTTP status codes 2xx and 3xx returned.	N/A
Outbound traffic from the Internet	The amount of outbound traffic from the Internet.	byte
Inbound traffic to the Internet	The amount of inbound traffic to the Internet.	byte
Outbound traffic from the internal network	The amount of outbound traffic from the internal network.	byte
Inbound traffic to the internal network	The amount of inbound traffic to the internal network.	byte
CDN outbound traffic	The amount of outbound traffic sent over CDN after CDN is activated. Such outbound traffic over CDN is back-to-origin traffic.	byte
CDN inbound traffic	The amount of inbound traffic received over CDN after CDN is activated.	byte
Outbound traffic of cross-region replication	The amount of outbound traffic generated during data replication after cross-region replication is enabled.	byte
Inbound traffic of cross-region replication	The amount of inbound traffic generated during data replication after cross-region replication is enabled.	byte
Storage size	The amount of total storage occupied by the buckets of a specified user before the statistics collection deadline.	byte

Metric	Description	Unit
Number of PUT requests	The total number of PUT requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A
Number of GET requests	The total number of GET requests made by the user between 00:00:00 on the first day of the current month and the statistics collection deadline.	N/A

Metrics for request status details of OSS

Metric	Description	Unit
Number of requests with server-side errors	The total number of system-level error requests with the returned HTTP status code 5xx.	N/A
Percentage of requests with server-side errors	The percentage of requests with server-side errors out of all requests.	%
Number of requests with network errors	The total number of requests with the returned HTTP status code 499.	N/A
Percentage of requests with network errors	The percentage of requests with network errors out of all requests.	%
Number of requests with client-side authorization errors	The total number of requests with the returned HTTP status code 403.	N/A
Percentage of requests with client-side authorization errors	The percentage of requests with authorization errors out of all requests.	%
Number of requests with client-side errors indicating resources not found	The total number of requests with the returned HTTP status code 404.	N/A
Percentage of requests with client-side errors indicating resources not found	The percentage of requests with errors indicating resources not found out of all requests.	%
Number of requests with client-side timeout errors	The total number of requests with the returned HTTP status code 408 or OSS error code RequestTimeout.	N/A
Percentage of requests with client-side timeout errors	The percentage of requests with client-side timeout errors out of all requests.	%
Number of requests with other client-side errors	The total number of requests other than the foregoing client-side error requests with the returned HTTP status code 4xx.	N/A
Percentage of requests with other client-side errors	The percentage of requests with other client-side errors out of all requests.	%

Metric	Description	Unit
Number of successful requests	The total number of requests with the returned HTTP status code 2xx.	N/A
Percentage of successful requests	The percentage of successful requests out of all requests.	%
Number of redirected requests	The total number of requests with the returned HTTP status code 3xx.	N/A
Percentage of redirected requests	The percentage of redirected requests out of all requests.	%

Metrics for maximum latency of OSS

Metric	Description	Unit
Maximum end-to-end latency of GetObject requests	The maximum end-to-end latency of successful GetObject requests.	ms
Maximum server latency of GetObject requests	The maximum server latency of successful GetObject requests.	ms
Maximum end-to-end latency of HeadObject requests	The maximum end-to-end latency of successful HeadObject requests.	ms
Maximum server latency of HeadObject requests	The maximum server latency of successful HeadObject requests.	ms
Maximum end-to-end latency of PutObject requests	The maximum end-to-end latency of successful PutObject requests.	ms
Maximum server latency of PutObject requests	The maximum server latency of successful PutObject requests.	ms
Maximum end-to-end latency of PostObject requests	The maximum end-to-end latency of successful PostObject requests.	ms
Maximum server latency of PostObject requests	The maximum server latency of successful PostObject requests.	ms
Maximum end-to-end latency of AppendObject requests	The maximum end-to-end latency of successful AppendObject requests.	ms
Maximum server latency of AppendObject requests	The maximum server latency of successful AppendObject requests.	ms
Maximum end-to-end latency of UploadPart requests	The maximum end-to-end latency of successful UploadPart requests.	ms
Maximum server latency of UploadPart requests	The maximum server latency of successful UploadPart requests.	ms
Maximum end-to-end latency of UploadPartCopy requests	The maximum end-to-end latency of successful UploadPartCopy requests.	ms
Maximum server latency of UploadPartCopy requests	The maximum server latency of successful UploadPartCopy requests.	ms

Metrics for successful request category of OSS

Metric	Description	Unit
Number of successful GetObject requests	The number of successful GetObject requests.	N/A
Number of successful HeadObject requests	The number of successful HeadObject requests.	N/A
Number of successful PostObject requests	The number of successful PostObject requests.	N/A
Number of successful AppendObject requests	The number of successful AppendObject requests.	N/A
Number of successful UploadPart requests	The number of successful UploadPart requests.	N/A
Number of successful UploadPartCopy requests	The number of successful UploadPartCopy requests.	N/A
Number of successful DeleteObject requests	The number of successful DeleteObject requests.	N/A
Number of successful DeleteObjects requests	The number of successful DeleteObjects requests.	N/A

Metrics for KVStore for Redis

Metric	Description	Apsara Stack service	Unit
CPU utilization	The CPU utilization of a KVStore for Redis instance.	KVStore for Redis	%
Memory usage	The percentage of memory that is in use.	KVStore for Redis	%
Used memory	The amount of memory that is in use.	KVStore for Redis	byte
Number of used connections	The total number of client connections that are in use.	KVStore for Redis	N/A
Percentage of used connections	The percentage of connections that are in use.	KVStore for Redis	%
Write bandwidth	The write traffic per second.	KVStore for Redis	byte/s
Read bandwidth	The read traffic per second.	KVStore for Redis	byte/s
Number of failed operations per second	The number of failed operations on a KVStore for Redis instance per second.	KVStore for Redis	count/s
Write bandwidth usage	The percentage of total bandwidth used by write operations.	KVStore for Redis	%
Read bandwidth usage	The percentage of total bandwidth used by read operations.	KVStore for Redis	%
Used QPS	The number of queries per second (QPS).	KVStore for Redis	count/s

Metric	Description	Apsara Stack service	Unit
QPS usage	The QPS usage.	KVStore for Redis	%
Average response time	The average response time.	KVStore for Redis	ms
Maximum response time	The maximum response time.	KVStore for Redis	ms
Number of failed commands	The number of failed commands.	KVStore for Redis	N/A
Hit rate	The current hit rate.	KVStore for Redis	%
Inbound traffic	The inbound traffic to a KVStore for Redis instance.	KVStore for Redis	byte
Inbound bandwidth usage	The inbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%
Outbound traffic	The outbound traffic from a KVStore for Redis instance.	KVStore for Redis	byte
Outbound bandwidth usage	The outbound bandwidth usage of a KVStore for Redis instance.	KVStore for Redis	%

Metrics for VPN Gateway

Metric	Dimension	Monitoring period	Unit
Number of inbound packets in a connection per second	User and instance	1 minute	pps
Number of outbound packets in a connection per second	User and instance	1 minute	pps
Inbound bandwidth of a connection	User and instance	1 minute	bit/s
Outbound bandwidth of a connection	User and instance	1 minute	bit/s
Number of connections	User and instance	1 minute	N/A

Metrics for AnalyticDB for PostgreSQL

Metric	Description	Unit
Connection usage	The number of connections between an application and an AnalyticDB for PostgreSQL instance per second.	%
CPU utilization	The CPU utilization of an AnalyticDB for PostgreSQL instance.	%
Disk usage	The disk usage of an AnalyticDB for PostgreSQL instance.	%

Metric	Description	Unit
IOPS usage	The number of I/O requests for an AnalyticDB for PostgreSQL instance per second.	%
Memory usage	The memory usage of an AnalyticDB for PostgreSQL instance.	%

Metrics for ApsaraDB for MongoDB

Tab	Metric	Description	Unit
Basic metric	CPU utilization	The CPU utilization of an ApsaraDB for MongoDB instance.	%
	Memory usage	The memory usage of an ApsaraDB for MongoDB instance.	%
	Disk usage	The disk usage of an ApsaraDB for MongoDB instance.	%
	IOPS usage	The percentage of the IOPS used by an ApsaraDB for MongoDB instance out of the maximum available IOPS.	%
	Connection usage	The number of connections between an application and an ApsaraDB for MongoDB instance per second.	%
	QPS	The number of queries per second.	N/A
	Number of used connections	The number of current connections to an ApsaraDB for MongoDB instance.	N/A
Disk capacity	Disk space occupied by an instance	The total used space.	byte
	Disk space occupied by data	The disk space occupied by data.	byte
	Disk space occupied by logs	The disk space occupied by logs.	byte
Network request	Inbound traffic to the internal network	The inbound traffic.	byte
	Outbound traffic from the internal network	The outbound traffic.	byte

Tab	Metric	Description	Unit
	Number of requests	The number of processed requests.	N/A
Number of operations	Number of Insert operations	None	N/A
	Number of Query operations	None	N/A
	Number of Update operations	None	N/A
	Number of Delete operations	None	N/A
	Number of Getmore operations	None	N/A
	Number of Command operations	None	N/A

Metrics for EIP

Metric	Description	Dimension	Monitoring period	Unit
Inbound bandwidth	The traffic that passes through EIP to ECS per second.	Instance	1 minute	bit/s
Outbound bandwidth	The traffic that passes through EIP from ECS per second.	Instance	1 minute	bit/s
Number of inbound packets per second	The number of packets that pass through EIP to ECS per second.	Instance	1 minute	pps
Number of outbound packets per second	The number of packets that pass through EIP from ECS per second.	Instance	1 minute	pps
Packet loss rate due to throttling	The packet loss rate when the actually used bandwidth exceeds the configured upper limit.	Instance	1 minute	pps

Metrics for API Gateway

Metric	Description	Dimension	Unit	Monitoring period

Metric	Description	Dimension	Unit	Monitoring period
Error distribution	The number of 2xx, 4xx, and 5xx status codes returned for an API in the monitoring period.	User and API	N/A	1 minute
Inbound traffic	The total traffic of requests received by an API in the monitoring period.	User and API	byte	1 minute
Outbound traffic	The total traffic of responses sent by an API in the monitoring period.	User and API	byte	1 minute
Response time	The latency between the time when API Gateway calls the backend service of an API and the time when the result is received from the backend service in the monitoring period.	User and API	s	1 minute
Number of total requests	The total number of requests received by an API in the monitoring period.	User and API	N/A	1 minute

1.1.6.3.3. View monitoring charts

You can view monitoring charts to obtain up-to-date information about each instance.

Procedure

1. Log on to the Apsara Uni-manager console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Monitoring Charts** in the **Actions** column corresponding to an instance.

   On the Monitoring Charts page that appears, you can select a date and time to view the monitoring data of each metric.

1.1.6.4. Alerts

1.1.6.4.1. View alert overview

On the **Overview** page in Cloud Monitor, you can view the alert status statistics and alert logs.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.

2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Overview**.
4. On the **Overview** page, view the alert status statistics and alert logs that are generated in the last 24 hours.

1.1.6.4.2. Enable or disable alert notification

You can choose whether to enable alert notification by email or DingTalk.

Prerequisites

Valid contact information is specified when you create a user. If the contact information has changed, you must modify your personal information. For more information, see Modify personal information.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **Personal information**.
3. In the **Messages** section, select **Email** or **DingTalk** to enable alert notification.

   To disable alert notification, clear the corresponding check box.

1.1.6.4.3. View alert logs

You can view alert information to stay up to date on the running status of Elastic Compute Service (ECS), ApsaraDB RDS, Server Load Balancer (SLB), KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, Elastic IP Address (EIP), API Gateway, and Object Storage Service (OSS).

Context

Alert information contains information for all items that do not comply with your configured alert rules.

> **Note**
> - The system can retain up to one million alert items generated within the last three months.
> - This topic describes how to view alert information for ECS. You can view the alert information for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane of the Cloud Monitor page, choose **Alerts > Alert History**.
4. On the **Alert Rule History List** page, filter alert information by rule ID, rule name, service, and date.

   The following table describes the fields in the query result. Alert information fields

Parameter	Description
Product	The service for which the alert was triggered.
Fault Instance	The instance for which the alert was triggered.
Occurred At	The time when the alert was triggered.
Rule Name	The name of the alert rule.

Parameter	Description
Status	The status of the alert rule.
Notification Contact	The recipient of the alert notification.

1.1.6.4.4. Alert rules

1.1.6.4.4.1. View alert rules

After you create alert rules, you can view your alert rules on the Alert Rules page.

Context

The system provides alert rules for ECS, ApsaraDB RDS, SLB, OSS, KVStore for Redis, VPN Gateway, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, EIP, and API Gateway.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.

   On the **Alert Rules** page, view the detailed information of alert rules.

1.1.6.4.4.2. Create an alert rule

You can create an alert rule to monitor an instance.

Prerequisites

For Elastic Compute Service (ECS) instances, you must install a monitoring plug-in to collect metric data at the operating system level.

You can use the following method to install a monitoring plug-in:

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane, choose **Cloud Service Monitoring > ECS**.
4. In the ECS instance list, select the instances that you want to monitor and click **Batch Install**.

> **Note**
>
> The monitoring chart displays monitoring data 5 to 10 minutes after the monitoring plug-in is installed.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.

> **Note** You can also use the search feature to query specific instances for which you want to create alert rules.

6. On the **Alert Rules** page, click **Create Alert Rule**.

   Parameters for creating an alert rule

Parameter	Description
Product	The monitored cloud service.
Resource Range	The range of resources that is associated with the alert rule.
Rule Description	The description of the alert rule.
Add Rule Description	Click **Add Rule Description** to go to the rule configuration panel. For more information, see Parameters for adding rule description.
Effective Time	Only a single alert is sent during each mute duration, even if the metric value exceeds the alert rule threshold several times in a row.
Effective Period	An alert is sent only when the threshold is crossed during the effective period.
HTTP CallBack	The callback URL when the alert conditions are met.
Alert Contact Group	The group to which alerts are sent.

   Parameters for adding rule description

Parameter	Description
Rule Name	The name of the alert rule. The name must be 1 to 64 characters in length and can contain letters and digits.
Metric Name	Different products have different monitoring metrics. For more information, see Metrics.
Comparison	The comparison between thresholds and observed values. The comparison operators include >, >=, <, and <=. When the comparison rule is satisfied, an alert rule is triggered.
Threshold and Alert Level	Different metrics have different reference thresholds.

7. Click **OK**.

1.1.6.4.4.3. Disable an alert rule

You can disable one or more alert rules.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, choose **More > Disable** in the **Actions** column corresponding to the alert rule to be

disabled.

7. In the Disable Alert Rule message, click **Confirm**.

1.1.6.4.4.4. Enable an alert rule

You can re-enable alert rules at any time after they have been disabled.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > Cloud Monitor**.
3. In the left-side navigation pane of the CloudMonitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, choose **More > Enable** in the **Actions** column corresponding to the alert rule to be enabled.
7. In the message that appears, click **Confirm**.

1.1.6.4.4.5. Delete an alert rule

You can delete alert rules that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, choose **Products > Monitoring and O&M > CloudMonitor**.
3. In the left-side navigation pane of the Cloud Monitor page, click **Cloud Service Monitoring**.
4. Click a cloud service.
5. Click **Alert Rules** in the **Actions** column corresponding to an instance.
6. On the **Alert Rules** page, click **Delete** in the **Actions** column corresponding to the alert rule to be deleted.
7. In the Delete Alert message, click **Confirm**.

1.1.7. VMware Cloud on Alibaba Cloud

1.1.7.1. VMware Cloud on Alibaba Cloud

1.1.7.1.1. Log on to the VMware Cloud on Alibaba Cloud console

This topic describes how to log on to the VMware Cloud on Alibaba Cloud console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.

2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

5. In the top navigation bar, choose **Products > Elastic Computing > VMware Cloud on Alibaba Cloud**.

1.1.7.1.2. Bind a VMware Cloud on Alibaba Cloud region

Before you use VMware Cloud on Alibaba Cloud, you must bind a VMware Cloud on Alibaba Cloud region to an organization.

Prerequisites

A VMware Cloud on Alibaba Cloud region is managed. For more information, see Add a VMware node.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, click **Resource Pools**.
4. In the organization navigation tree, click an organization. In the **Regions** section, select the region that you want to bind.
5. Click **Update Association**.

1.1.7.1.3. Instructions

1.1.7.1.3.1. Limits

Before you use VMware Cloud on Alibaba Cloud virtual machine (VM) templates, you must familiarize yourself with the instance limits.

General limits

- You must select appropriate operating systems for VMware Cloud on Alibaba Cloud VM templates.

  The following operating systems are confirmed to be supported and available in the Apsara Uni-manager Management Console:

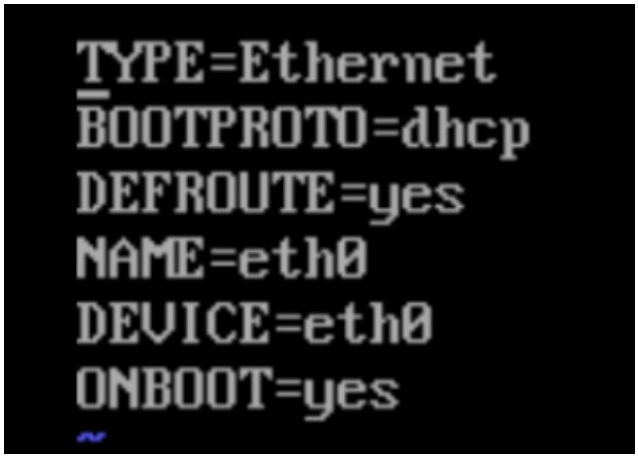
  - CentOS8.2.2004
  - CentOS7.2003
  - CentOS6.10
  - Ubuntu-20.04.1
  - Ubuntu-18.04.5
  - Ubuntu-16.04.7
  - WindowsServer2016
  - WindowsServer2019

- The Apsara Uni-manager Management Console supports VMware vSphere 6.x. Other versions of VMware vSphere such as 5.x or 7.x can be supported in theory. However, whether or not specific versions are supported depends on the compatibility of the VMware Cloud on Alibaba Cloud API and must be evaluated by the R&D team of the Apsara Uni-manager Management Console.
- You must install VMware Tools.

  For more information, see the VMware documentation. Select Full Installation in the installation process.
- You must modify network interface controller (NIC) configurations in the operating system of the VM.

  When you create a VM in the Apsara Uni-manager Management Console, you can specify the IP address of the operating system. This feature is supported by valid NIC configurations.

  Operating systems of VM templates must be in Dynamic Host Configuration Protocol (DHCP) mode. Information such as the MAC address and universally unique identifier (UUID) in the NIC configurations must be removed. The following information can be retained.



> **Note**
>
> Some additional configurations are required for the following operating systems:
>
> - CentOS 6: You must clear the content in the NIC configuration file named 70-persistent-net.rules. The file is stored in the /etc/udev/rules.d/ directory.
> - CentOS 7: The system generates the name for a NIC, such as ifcfg-ens160. You must modify the name to ifcfg-eth0 to make the name take effect.
> - Ubuntu 18.04, 20.04, and later: You must run the `sudo rm /etc/netplan/*.yaml` command to remove the NIC configurations.

1.1.7.1.3.2. Suggestions

Before you use VMware Cloud on Alibaba Cloud virtual machine (VM) templates, take note of the following operation suggestions:

- Select the latest version of VM hardware.
- Select thin provision for VM disks.

  Disk replication is required when you create VMs based on templates. Files of disks of the thin provision type are small in size. This helps accelerate the creation of VMs.

> **Note**
>
> Large sizes of disk files in VM templates or slow storage write speeds may cause VM creation to time out and fail. The maximum timeout period supported by the Apsara Uni-manager Management Console is 10 minutes.

1.1.7.1.4. Instances

1.1.7.1.4.1. Create a VMware Cloud on Alibaba Cloud instance

A VMware Cloud on Alibaba Cloud instance is a virtual machine (VM) that contains the basic computing components of a server, such as CPU, memory, operating system, network, and disks.

Prerequisites

- The region where VMware Cloud on Alibaba Cloud is deployed is managed. For more information, see Add a VMware node.
- The region where VMware Cloud on Alibaba Cloud is deployed is bound to an organization. For more information, see Bind a VMware Cloud on Alibaba Cloud region.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click **Create Instance** in the upper-right corner.
5. Configure parameters listed in the following table to create an instance.

Section	Parameter	Required	Description
Basic Settings	**Organization**	Yes	The organization in which to create the instance.
	Resource Set	Yes	The resource set in which to create the instance.
Region	**Region**	Yes	The region in which to create the instance.
	Zone	Yes	The zone in which to create the instance.
	VPC	Yes	The VPC in which to create the instance.
	vSwitch	Yes	Select the vSwitch to which the instance belongs. The vSwitch corresponds to the port group of a VMware ESXi host or a distributed switch, and maps to the VLAN of a physical switch.
	Private IP Address	Yes	The private IPv4 address of the instance. The private IPv4 address must be within the CIDR block of the vSwitch.
	Private Subnet Mask	Yes	The private subnet mask. Example: 255.255.255.0. The specified subnet mask must be within the CIDR block of the selected vSwitch.
	Private IP Address of Gateway	Yes	The private IP address of the gateway. Example: 192.168.100.1. The IP address must be within the CIDR block of the selected vSwitch.
	Private IP Address of DNS Server	No	The private IP address of the DNS server. Example: 114.114.114.114. The IP address must be within the CIDR block of the selected vSwitch.

Section	Parameter	Required	Description
Instance	**Instance Family**	No	The instance family of the instance. Valid values: ○ Memory Optimized ○ Compute Optimized ○ General Purpose
	Instance Type	Yes	The instance type of the instance. You can specify the vCPUs and memory.
Image	**Image Type**	No	The type of the image. Default value: **Public Image**.
	Public image	Yes	The public image of the instance.
	System Disk (GB)	No	The system disk to which the operating system is installed. You can configure different storage types for the disk. Valid values: ○ **Shared Storage: All**: The system selects an available shared storage. We recommend that you select this type. ○ **Shared Storage: storageA**: The storage named storageA of the VMware Cloud on Alibaba Cloud instance is used. Administrators must make sure the storage is appropriate. If the storage capacity is insufficient, the instance fails to be created.

Section	Parameter	Required	Description
Storage	**Data Disk (GB)**	No	You can also add data disks after the instance is created. You can configure different storage types for the disk. Valid values: ◦ **Shared Storage: All**: The system selects an available shared storage. We recommend that you select this type. ◦ **Shared Storage: storageA**: The storage named storageA of the VMware Cloud on Alibaba Cloud instance is used. Administrators must make sure the storage is appropriate. If the storage capacity is insufficient, the instance fails to be created. You must also specify the provision type when you create the instance. Valid values: ◦ Thin Provision: Storage space increases with the use of the disk. ◦ Thick Provision Lazy Zeroed: Storage space is equal to the size of the disk and does not increase. The disk is formatted when data is written. ◦ Thick Provision Eager Zeroed: Storage space is equal to the size of the disk and does not increase. The storage of the disk is immediately formatted when the disk is created.
Password	**Password Setting**	No	Select **Set after Purchase**.
Instance Name	**Instance Name**	Yes	The name of the instance. The name must be 2 to 128 characters in length and can contain letters, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter and cannot start with http:// or https://.

6. Click **Submit**.

1.1.7.1.4.2. View instance information

You can view the list of created instances as well as details of individual instances, such as their basic configurations, disks, and elastic network interfaces (ENIs).

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.

   You can view the list of VMware Cloud on Alibaba Cloud instances that are deployed in the current region.
4. Use one of the following methods to go to the details page of an instance:
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column corresponding to the instance.
   - Choose **More** > **Show Details** in the **Actions** column corresponding to the instance.

1.1.7.1.4.3. Modify an instance

You can modify the name and description of a created VMware Cloud on Alibaba Cloud instance.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance that you want to modify and choose **More** > **Modify** in the **Actions** column.
5. Modify the name and description of the instance.
6. Click **OK**.

1.1.7.1.4.4. Remotely connect to an instance

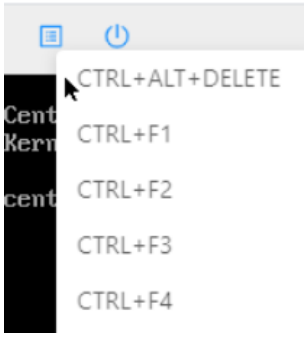
You can remotely connect to and manage added VMware Cloud on Alibaba Cloud instances.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance that you want to manage and click **Remote Connection** in the **Actions** column.
5. Enter the username and password.
   - For a Linux instance, enter the username *root* and the logon password.

     > **Note**
     >
     > When you log on to the Linux instance, the password is not displayed as you enter it. Press the Enter key after you enter the password.

- For a Windows instance, to use a key combination such as Ctrl+Alt+Delete, click the List icon in the upper-right corner of the page and select the corresponding composite key from the drop-down list.



Enter the username and password, and click the Log On icon.

1.1.7.1.4.5. Stop an instance

You can stop VMware Cloud on Alibaba Cloud instances that are not in use. The stop operation interrupts services that are running on the instances. Exercise caution when you perform this operation.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to stop instances:
   - To stop a single instance, find the instance and choose **More** > **Instance Status** > **Stop** in the **Actions** column.
   - To stop one or more instances at a time, select the instances and click **Stop** in the lower part of the Instances page.
5. Click **OK**.

Execution results

When the instance is being stopped, its state in the **Status** column changes from **Running** to **Stopping**. After the instance is stopped, its state changes to **Stopped**.

1.1.7.1.4.6. Start an instance

You can start a stopped instance.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.

3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to start instances:
   - To start a single instance, find the instance and choose **More** > **Instance Status** > **Start** in the **Actions** column.
   - To start one or more instances at a time, select the instances and click **Start** in the lower part of the Instances page.
5. Click **OK**.

Execution results

When the instance is being started, its state in the **Status** column changes from **Stopped** to **Starting**. After the instance is started, its state changes to **Running**.

1.1.7.1.4.7. Restart an instance

After you change the logon password of an instance or install system updates, you must restart the instance. The restart operation stops the instances for a short period of time and interrupts services that are running on the instance. Exercise caution when you perform this operation.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Use one of the following methods to restart the instance:
   - To restart a single instance, find the instance and choose **More** > **Instance Status** > **Restart** in the **Actions** column.
   - To restart one or more instances at a time, select the instances and click **Restart** in the lower part of the Instances page.
5. In the Restart Instance dialog box, select a restart mode.
   - **Restart**: restarts the instance normally.
   - **Force Restart**: forces the instance to restart. This may result in the loss of unsaved data.
6. Click **OK**.

1.1.7.1.4.8. Delete an instance

You can delete instances that are no longer needed to release their resources. Deleted instances cannot be recovered. We recommend that you back up data before you delete an instance. If data disks are released with the instances, the disk data cannot be recovered.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.

2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Select the instance and click **Delete** in the lower part of the Instances page.
5. Click **OK**.

1.1.7.1.4.9. Change the instance type of an instance

You can change the instance types of instances to suit your business needs. This eliminates the need to create VMware Cloud on Alibaba Cloud instances.

Prerequisites

The instance is in the **Stopped** state.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, select an organization, a resource set, and a region.
4. Find the instance whose instance type you want to change and click **Upgrade/Downgrade** in the **Actions** column.
5. On the page that appears, select a new instance type and click **Submit**.

   The page that appears shows the instance types available for selection.
6. Start the instance to make the new instance type take effect.

   For more information, see Start an instance.

1.1.7.1.5. Images

1.1.7.1.5.1. Create a custom image

You can perform the following steps to create a custom image.

Background information

You can create a custom image from an instance to replicate the data of all disks on the instance.

> **Note**
>
> To avoid data security risks, we recommend that you delete sensitive data from an instance before you use the instance to create a custom image.

Create a custom image from an instance

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance from which you want to create a custom image and choose **More** > **Create Custom Image** in the **Actions** column.
5. Set the name, sharing scope, and description for the custom image, and click **OK**.

The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It cannot start with a special character or digit.

You can set the sharing scope to the permission scope of the image.

The description must be 2 to 256 characters in length and cannot start with http:// or https://.

1.1.7.1.5.2. View images

You can view the list of created images.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, choose **Images** > **Images**.
3. In the top navigation bar, move the pointer over **Region** and select the region where the image is created.
4. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
Image Name	The image name used to search for the image.
Image ID	The image ID used to search for the image.

1.1.7.1.6. Snapshots

1.1.7.1.6.1. Create a snapshot

You can manually create a snapshot for a disk to back up disk data.

Prerequisites

- The instance to which the disk is attached is in the **Running** or **Stopped** state.
- The disk is in the **Running** state.

Background information

A snapshot of a disk can be used to roll back data of the disk.

When you create a snapshot, take note of the following items:

- For each disk, the first snapshot taken is a full snapshot and subsequent snapshots are incremental snapshots. It takes longer to create the first full snapshot than it does subsequent incremental snapshots. The amount of taken time depends on the amount of data that has been changed since the previous snapshot. The more data that has been changed, the longer it takes to create an incremental snapshot.
- Avoid creating snapshots during peak hours.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.

3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance from which you want to create a snapshot. On the page that appears, click the **Snapshots** tab.
5. Click **Create and Bind Snapshot**.
6. Set the name, type, and description for the snapshot, and click **Submit**.

Parameter	Description
Snapshot Name	The name of the snapshot.
Snapshot Type	The snapshot type. Valid values: ○ Disk Snapshot: stores information in disks. ○ Memory Snapshot: stores information in memory.
Snapshot Description	The description of the snapshot.

1.1.7.1.6.2. Delete a snapshot

You can delete a snapshot that is no longer needed. After the snapshot is deleted, it cannot be recovered.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance whose snapshot is to be deleted and click the **Snapshots** tab.
5. Use one of the following methods to delete the snapshot:
   - To delete a single snapshot, find the snapshot and click **Delete** in the **Actions** column.
   - To delete one or more snapshots at a time, select the snapshots and click **Delete** in the lower part of the Snapshots tab.
6. Click **OK**.

1.1.7.1.6.3. View snapshots

You can view the list of created snapshots.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance in which you want to view snapshots and click the **Snapshots** tab.
5. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

You can select multiple filter options to narrow down search results.

Parameter	Description
Snapshot Name	The snapshot name used to search for the snapshot.
Snapshot ID	The snapshot ID used to search for the snapshot.

1.1.7.1.7. Disks

1.1.7.1.7.1. Create a disk

To increase the storage space of VMware Cloud on Alibaba Cloud instances, you can create standalone data disks and then attach them to the instances. This topic describes how to create an empty data disk. You cannot create standalone system disks.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance for which you want to create a disk and click the **Disks** tab.
5. Click **Create and Attach Disk**.
6. Configure parameters listed in the following table to create a disk.

Section	Parameter	Required	Description
Region	**Zone**	Yes	The zone in which to create the disk.
	Specifications	Yes	The disk category and the disk size.

Section	Parameter	Required	Description
Basic Settings	**Provision Type**	Yes	The provision type. Valid values: ○ Thin Provision: Storage space increases with the use of the disk. ○ Thick Provision Lazy Zeroed: Storage space is equal to the size of the disk and does not increase. The disk is formatted when data is written. ○ Thick Provision Eager Zeroed: Storage space is equal to the size of the disk and does not increase. The storage of the disk is immediately formatted when the disk is created.

7. Click **Submit**.

Execution results

The created disk is displayed in the disk list and in the **Running** state.

1.1.7.1.7.2. View disks

You can view the list of created disks and the details of individual disks.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to view disks. On the page that appears, click the **Disks** tab.
5. Select a filter option from the drop-down list, enter the relevant information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
Disk Name	The disk name used to search for the disk.

Parameter	Description
Disk ID	The disk ID used to search for the disk.
Disk Properties	The disk type used to search for disks of that type. Valid values: ○ All ○ System Disk ○ Data Disk

1.1.7.1.7.3. Detach a data disk

You can detach data disks. System disks cannot be detached.

Procedure

> **Warning**
> Resources are released after disks are detached. Make sure that the data of a disk is backed up before you detach it.

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance from which you want to detach a data disk. On the page that appears, click the **Disks** tab.
5. Find the data disk that you want to detach and choose **More** > **Detach** in the **Actions** column.
6. Click **OK**.

1.1.7.1.8. ENIs

1.1.7.1.8.1. Create an ENI

You can create and bind elastic network interfaces (ENIs) to VMware Cloud on Alibaba Cloud instances.

Prerequisites

A virtual private cloud (VPC) and a vSwitch are created. For more information, see Create a VPC and Create a vSwitch in *Apsara Stack VPC User Guide*.

Background information

ENIs are classified into primary and secondary ENIs.

A primary ENI is created by default when an instance is created in a VPC. This primary ENI shares the lifecycle of the instance with which it is created and cannot be unbound from the instance.

ENIs that are separately created are secondary ENIs. This topic describes how to create a secondary ENI.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to create an ENI. On the page that appears, click the **ENIs** tab.
5. Click **Create and Bind ENI**.
6. Configure parameters listed in the following table to create an ENI.

Section	Parameter	Required	Description
Region	**Organization**	Yes	The organization in which to create the ENI.
	Resource Set	Yes	The resource set in which to create the ENI.
	Region	Yes	The region in which to create the ENI.
	Zone	Yes	The zone in which to create the ENI.
Basic Settings	**VPC**	Yes	The VPC in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. **Note** After an ENI is created, its VPC cannot be changed.
	vSwitch	Yes	The vSwitch in which to create the ENI. The secondary ENI can be bound only to an instance within the same VPC. Select a vSwitch that is deployed within the same zone as the instance to which the ENI is bound. The vSwitch of the ENI can be different from that of the instance. **Note** After an ENI is created, you cannot change its vSwitch.

7. Click **Submit**.

Execution results

The created ENI is displayed on the ENIs tab and is in the **Bound** state.

1.1.7.1.8.2. View ENIs

You can view the list of created elastic network interfaces (ENIs).

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Click the instance for which you want to view ENIs. On the page that appears, click the **ENIs** tab.
5. Select a filter option, enter the corresponding information in the search box, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Parameter	Description
ENI Name	The ENI name used to search for the ENI.
ENI ID	The ENI ID used to search for the ENI.
VSwitch ID	The vSwitch ID used to search for the ENIs that are associated with the vSwitch.

1.1.7.1.8.3. Delete an ENI

You can delete secondary elastic network interfaces (ENIs) that are no longer needed.

Background information

Only secondary ENIs can be deleted. Primary ENIs share the same lifecycle as instances and cannot be deleted.

Procedure

1. Log on to the VMware Cloud on Alibaba Cloud console.
2. In the left-side navigation pane, click **Instances**.
3. In the top navigation bar, move the pointer over **Region** and select the region where VMware Cloud on Alibaba Cloud is deployed.
4. Find the instance whose secondary ENI is to be deleted and click the **ENIs** tab.
5. Find the secondary ENI and click **Delete** in the **Actions** column.
6. Click **OK**.

1.1.8. Enterprise

1.1.8.1. Organizations

1.1.8.1.1. Create an organization

You can create organizations to store resource sets and their resources. This topic describes how to create an organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. In the organization navigation tree, click the name of the parent organization under which you want to create an organization. Click **Create Organization** in the upper-right corner of the page.
5. In the Add Organization dialog box, enter an organization name and click **OK**.

1.1.8.1.2. View organization information

You can view information of an organization on the Organizations page.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. (Optional)Enter the name of the organization that you want to view in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the organization that you want to view.

   You can click the **Resource Sets**, **Users**, or **User Groups** tab to query the resource sets, users, and user groups under the organization.

   - Click the **Resource Sets** tab to view the resource set names, resource set IDs, creation time, creators, and user groups. Click the name of a resource set to view its details.
   - Click the **Users** tab to view the usernames, user status, and roles. Click a username to view the user details.
   - Click the **User Groups** tab to view the user group names, corresponding organizations, roles, users, and creation time.

Click icons in the upper-right corner of the **Resource Sets**, **Users**, and **User Groups** tabs to perform the following operations on the lists:

Icon	Description
	Shows the list in full screen mode. You can click the icon in the upper-right corner to exit the full screen mode.
	Selects the size of cells and fonts in the list. Valid values: • Default • Compact
	Refreshes the list.
	Selects or clears check boxes to determine the items to be displayed in the list. You can also click **Reset** to restore the list to its original settings.

1.1.8.1.3. Change the name of an organization

Users that have operation permissions on an organization can change the name of the organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. (Optional)Enter the organization name in the search box for fuzzy search above the organization tree.
5. Click the organization name that you want to change.
6. In the upper-right corner of the page, click **Editing**.
7. In the Edit Organization dialog box, change the organization name.
8. Click **OK**.

1.1.8.1.4. Change organization ownership

Users that have operation permissions on an organizations can change the ownership of the organization.

Prerequisites

- Make sure that each sub-organization under the organization that you want to change the ownership has a unique name.
- The ownership of an organization cannot be changed across level-1 organizations.

Context

Users can change the ownership of an organization across parent organizations. This way, the ownership of subordinate organizations, users, and resources are also changed in a cascading manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the **Enterprise** page, choose **Resources > Changes** .
4. (Optional)Enter the name of the organization that you want to change in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the organization whose ownership you want to change.
6. Click **Change Organization** on the right side of the page.
7. In the **Change Organization To** dialog box, select a new organization and click **OK** to change the ownership of the original organization along with that of its resources sets and users.

1.1.8.1.5. Obtain AccessKey pairs of an organization

An AccessKey pair that consists of an AccessKey ID and an AccessKey secret is used to implement symmetric encryption. This helps you verify the identity of a requester. The AccessKey ID is used to identify a user. The AccessKey secret is used to encrypt the signature string. This topic describes how to obtain AccessKey pairs of an organization.

Prerequisites

Only operations administrators and level-1 organization administrators can obtain AccessKey pairs of an organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane, choose **Resources > Organizations**.
4. In the organization navigation tree, click the name of the level-1 organization for which you want to obtain AccessKey pairs.
5. Click **Management AccessKey** on the right side of the page.
6. In the Management AccessKey dialog box, view the AccessKey pairs of the organization.

1.1.8.1.6. Create an AccessKey pair for an organization

You can create AccessKey pairs for organizations and delete the original ones to implement the rotation of your AccessKey pairs.

Prerequisites

- Level-1 organization administrators can create AccessKey pairs for organizations to which they belong.
- Operations administrators can create AccessKey pairs for all level-1 organizations.
- A maximum of two AccessKey pairs can be created for each organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. (Optional) Enter the name of the organization for which you want to create an AccessKey pair in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the level-1 organization for which you want to create an AccessKey pair.
6. Click **Management AccessKey** on the right side of the page.
7. In the **Management AccessKey** dialog box, click **Create AccessKey**.

1.1.8.1.7. Delete an AccessKey pair from an organization

You can delete AccessKey pairs that are no longer needed.

Prerequisites

- Level-1 organization administrators can delete AccessKeys from organizations to which they belong.
- Operations administrators can delete AccessKey pairs from all level-1 organizations.
- At least one AccessKey pair is retained for an organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. (Optional) Enter the name of the organization from which you want to delete an AccessKey pair in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the level-1 organization from which you want to delete an AccessKey pair.
6. Click **Management AccessKey** on the right side of the page.
7. In the **Management AccessKey** dialog box, find the AccessKey pair that you want to delete and click **Delete** in the **Operation** column.
8. In the message that appears, click **OK**.

1.1.8.1.8. Disable an AccessKey pair for an organization

You can disable AccessKey pairs that are no longer needed. Newly created AccessKey pairs are in the Enable state by default.

Prerequisites

- Level-1 organization administrators can disable AccessKey pairs for organizations to which they belong.
- Operations administrators can disable AccessKey pairs for all level-1 organizations.
- At least one AccessKey pair is enabled for each level-1 organization.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources** > **Organizations**.
4. (Optional) Enter the name of the organization for which you want to disable an AccessKey pair in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the level-1 organization for which you want to disable an AccessKey pair.
6. Click **Management AccessKey** on the right side of the page.
7. Find the AccessKey pair that you want to disable and click **Disable** in the **Operation** column.
8. In the message that appears, click **OK**.

1.1.8.1.9. Enable an AccessKey pair for an organization

Disabled AccessKey pairs must be enabled before they can be used. Newly created AccessKey pairs are in the Enable state by default.

Prerequisites

- Level-1 organization administrators can enable AccessKey pairs for organizations to which they belong.
- Operations administrators can enable AccessKey pairs for all level-1 organizations.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources** > **Organizations**.
4. (Optional) Enter the name of the organization for which you want to enable an AccessKey pair in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the level-1 organization for which you want to enable an AccessKey pair.
6. Click **Management AccessKey** on the right side of the page.
7. Find the AccessKey pair that you want to enable and click **Enable** in the **Operation** column.

1.1.8.1.10. Delete an organization

Administrators can delete organizations that are no longer needed.

Prerequisites

Before you delete an organization, make sure that the organization does not contain users, resource sets, or

subordinate organizations. Otherwise, the organization cannot be deleted.

Warning After the organization is deleted, the data of the organization cannot be recovered. Proceed with caution.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Organizations**.
4. (Optional)Enter the name of the organization that you want to delete in the search box above the organization navigation tree. Fuzzy search is supported.
5. Click the name of the organization that you want to delete.
6. Click **Delete** on the right side of the page.
7. In the Confirm message, click **OK**.

1.1.8.2. Resource sets

1.1.8.2.1. Create a resource set

You must create a resource set before you apply for resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Resource Sets**.
4. In the upper-left corner, click **Create Resource Set**.
5. In the **Create Resource Set** dialog box, set **Name** and **Organization**.
6. Click **OK**.

1.1.8.2.2. View the details of a resource set

When you want to use a cloud resource in your organization, you can view the details of the resource set that contains the resource, including all resource instances and users of the resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Resource Sets**.
4. (Optional)Select an **organization** from the drop-down list, or enter a **resource set** name in the search box, and then click **Search**.
5. Click the name of the resource set.
6. On the **Resource Set Details** page, click the **Resources** and **Users** tabs to view all resource instances and users of the resource set.
7. On the **Resources** tab, click the number next to a resource in a service card. You are redirected to the instance list page.

   On the page that appears, view the details of the instance list. The list is automatically filtered and displayed based on the organization and resource set.

1.1.8.2.3. Change the name of a resource set

You can change the name of a resource set to keep it up-to-date as an administrator.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Resource Sets**.
4. (Optional)Select an **organization** from the drop-down list, or enter a **resource set** name in the search box, and then click **Search**.
5. Find the resource set that you want to change and click **Edit Name** in the **Actions** column.
6. In the **Modify Resource Set** dialog box, enter a new name.
7. Click **OK**.

1.1.8.2.4. Add a member to or delete a member from a resource set

You can add a member to or delete a member from a resource set to manage member access to resources within the resource set. A member can be a user or a user group.

Prerequisites

- A resource set is created. For more information, see Create a resource set.
- A user is created. For more information, see Create a user.
- A user group is created. For more information, see Create a user group.

Context

Members of a resource set have the permissions to use resources in the resource set. If you delete resources from a resource set, members of the resource set are not affected. Similarly, If you delete members from a resource set, resources in the resource set are not affected.

You can delete a member that is no longer in use from a resource set. After the member is deleted, it is no longer able to access the resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Resource Sets**.
4. (Optional)Select an **organization** from the drop-down list, or enter a **resource set** name in the search box, and then click **Search**.
5. Find the resource set that you want to manage and click **Member authorization** in the **Actions** column.
6. (Optional)In the **Member authorization** dialog box, select the role type of the user or the user group that you want to add.
7. Add or remove a member.
   - Add a user or a user group: In the lower-left section, select the user or the user group that you want to add.
   - Delete a user or a user group: In the lower-right section, click **Remove** in the **Operation** column.
8. Click **OK**.

1.1.8.2.5. Delete a resource set

You can delete resource sets that are no longer needed as an administrator.

Prerequisites

The resource set to be deleted does not contain resources, users, or user groups.

> Notice
> - A resource set cannot be deleted if it contains resources, users, or user groups.
> - The default resource set cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Resource Sets**.
4. Find the resource set that you want to delete and click **Delete** in the **Actions** column.
5. In the **Confirm** message, click **OK**.

1.1.8.3. Roles

1.1.8.3.1. Create a custom role

You can create custom roles in the Apsara Uni-manager Management Console to more efficiently grant permissions to users so that different personnel can work with different features.

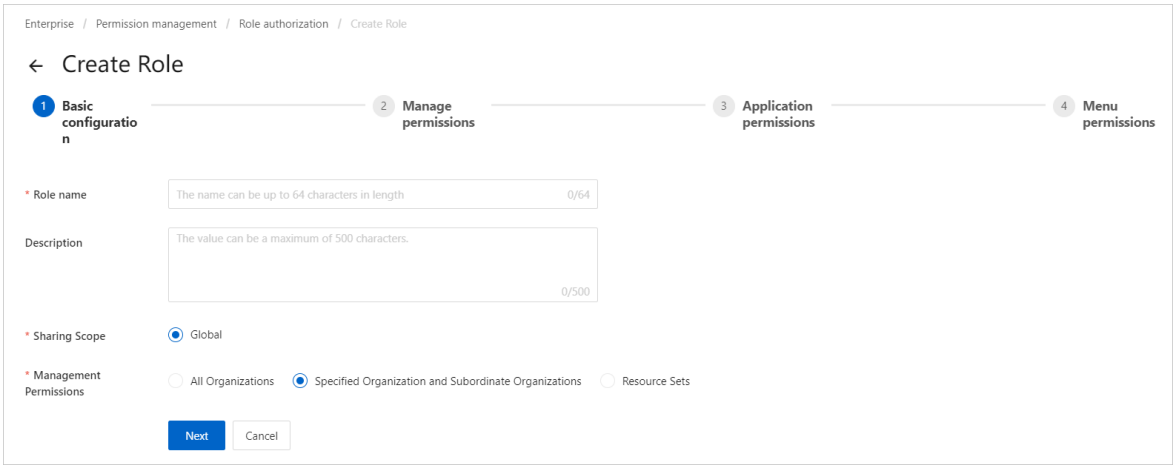
Context

A role is a set of access permissions. Each role has a range of permissions. A user can have multiple roles, which means that the user is granted all of the permissions defined for each role. A role can be used to grant the same set of permissions to a group of users.

The total number of custom and default roles cannot exceed 20.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Click **Create a role** in the upper-left corner.
5. In the **Basic configuration** step, set Role name, Description, Sharing Scope, and Management Permissions. Click **Next**.



The following table describes the role parameters.

Role parameters

Parameter	Description
Role name	The name of the role. The name can be up to 64 characters in length and can contain only letters and digits.
Description	Optional. The description of the role. The description can be up to 100 characters in length and can contain letters, digits, commas (,), semicolons (;), and underscores (_).
Sharing Scope	**Global**: This role is visible and valid for all organizations.
Management Permissions	○ **All Organizations** These permissions apply to all organizations involved. ○ **Specified Organization and Subordinate Organizations** These permissions apply to the organization to which the user belongs and its subordinate organizations. ○ **Resource Sets** These permissions apply to the resource sets that are assigned to the user.

6. In the **Manage permissions** step, select the operation permissions of this role on the Apsara Uni-manager Operations Console, and click **Next**.

   You can click permission categories on the left side to filter permissions.

7. In the **Application Permissions** step, select the operation permissions of this role on cloud services, and click **Next**.

   You can click service names on the left side to filter application permissions.

8. In the **Menu Permissions** step, select the operation permissions of this role on menus and homepage dashboard templates corresponding to the role, and click **Next**.

   You can click the parent menu on the left side to filter permissions on cascading menus.

Result

After the role is created, you can click **Authorize now** in the Submission result message to authorize users or user groups. You can also authorize users or user groups on the details page of the role.

1.1.8.3.2. View the details of a role

If you are uncertain about the specific permissions of a role, you can go to the **Role Authorization** page to view the role permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Click the name of the role that you want to view. On the **Role Authorization** page, view the information of the role.

   You can click the **Management Permissions**, **Application Permissions**, **Menu Permissions**, and **Authorized Personnel** tabs to view the role permissions.

1.1.8.3.3. Modify custom role information

You can modify the name and permissions of a custom role as an administrator.

Context

You cannot modify information of preset roles.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. In the role list, click **Modify** in the **Actions** column.
5. On the **Role Authorization** page, modify the name, description, management permission scope, related permissions, and authorized personnel of the role.
   - Modify role information: In the **Basic information** section, click the icon to the right of the item that you want to modify. After the item is modified, click **OK**.
   - Modify permissions: Click the **Management Permissions**, **Application Permissions**, or **Menu Permissions** tab, select or clear related permissions from the corresponding tab, and then click **Update**.
   - Authorize users: Click the **Authorized Personnel** tab. In the **Authorized User** section, click **Authorized**. In the dialog box that appears, select the users that you want to authorize and click **Confirm authorization**. To cancel the authorization from a user, click **Remove** in the **Operation** column.
   - Authorize user groups: Click the **Authorized Personnel** tab. In the **Authorized User Group** section, click **Authorized**. In the dialog box that appears, select the user groups that you want to authorize and click **Confirm authorization**. To cancel the authorization from a user group, click **Remove** in the **Operation** column.

1.1.8.3.4. Copy a role

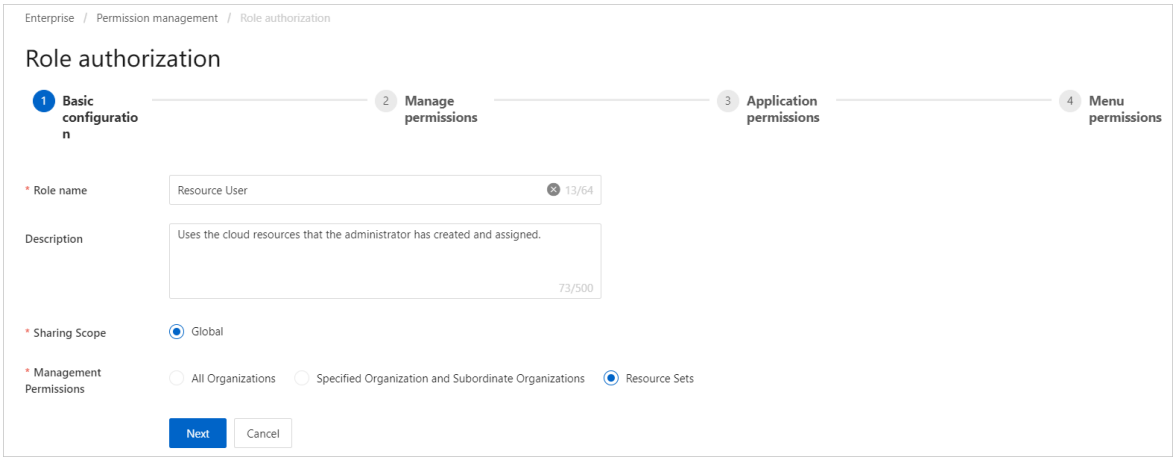
You can copy a preset role or a custom role to create a role that has the same permissions.

Context

Operations on the **Role authorization** page are the same as those for creating a custom role. You can add, modify, and remove the role permissions in the copied role. By default, if you do not modify the role permissions, the sharing scope, management permissions, application permissions, menu permissions, and authorized users are all the same as those of the source role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. In the role list, choose **More** > **Copy** in the **Actions** column corresponding to a role.
5. On the **Role authorization** page, set the new role name, sharing scope, and management permissions.



> **Note** The role name must be unique.

6. Complete the basic configurations of the new role, and click **Next**.
7. In the **Manage permissions** step, select the operation permissions that the new role has on the Apsara Uni-manager Management Console, and click **Next**.
8. In the **Application permissions** step, select the operation permissions that the new role has on cloud services, and click **Next**.
9. In the **Menu permissions** step, select the operation permissions that the new role has on menus, and click **Next**.

Result

After the role is created, you can click **Authorize now** in the Submission result message to authorize users or user groups. You can also authorize users or user groups on the details page of the role.

1.1.8.3.5. Disable a role

When you disable a role, all of its permissions are also disabled.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. In the role list, find the role that you want to disable and click **Disable** in the **Actions** column.

1.1.8.3.6. Enable a role

When you enable a disabled role, the permissions of the role are restored.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. In the role list, find the role that you want to enable and click **Enable** in the **Actions**.

1.1.8.3.7. Delete a custom role

You can delete custom roles that are no longer needed.

Prerequisites

- Default or preset roles cannot be deleted.
- To delete a role, you must unbind all user groups from the role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. In the role list, find the role that you want to delete and choose **More** > **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.8.4. Users

1.1.8.4.1. System users

1.1.8.4.1.1. Create a user

You can create a user and assign the user different roles as an administrator to meet different requirements for system access control.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab. Click **Create a user**.
5. In the dialog box that appears, set the following parameters.

Parameter	Required	Description
User name	Yes	The Apsara Stack tenant account name of the user. The name must be 1 to 64 characters in length and can contain letters, digits, hyphens (-), underscores (_), and periods (.).
Display name	Yes	The display name of the user. The name must be 1 to 128 characters in lengthand can contain letters, digits, hyphens (-), underscores (_), periods (.), and at signs (@).
Role	Yes	The role to be assigned to the user. **Note** You can enter role names in the field. Fuzzy match is supported.

Parameter	Required	Description
Tissue	Yes	The organization to which the user belongs.
Logon policy	Yes	The logon policy that restricts the logon time and IP addresses of the user. The default policy is automatically bound to new users. **Note** The default policy does not restrict the logon time and IP addresses of the user. To restrict the allowed logon time and IP addresses of the user, you can modify the logon policy of the user or create a logon policy for the user. For more information, see Create a logon policy.
Phone	Yes	The mobile number of the user. This mobile number is used to notify users of resource application and usage. Make sure that this mobile number is valid. **Note** If the mobile number of the user changes, update it on the system in a timely manner.
Landline	No	The landline number of the user. The landline number must be 4 to 20 characters in length and can contain only digits and hyphens (-).
Email	Yes	The email address of the user. Emails about the resource application and usage are sent to this email address. Make sure that this email address is valid. **Note** If the email address changes, update it on the system in a timely manner.
DingTalk Key	No	The key of the chatbot for the DingTalk group to which the user belongs. For more information about how to configure the key, see DingTalk development documentation.
Notify User by Email	No	If this option is selected, the Apsara Uni-manager Management Console informs the user configured as the alert contact by email whenever an alert is generated. **Note** You must configure an email server to receive emails. For more information, contact on-site O&M engineers.
Notify User by DingTalk	No	If this option is selected, the Apsara Uni-manager Management Console informs the user configured as the alert contact by DingTalk whenever an alert is generated.

6. Click **OK**.

1.1.8.4.1.2. Query a user

You can view user information such as the name, organization, mobile number, email address, role, logon time, and initial password.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Enter a **username** in the search box or select an **organization**, and then click **Search**.

   You can also click **Advanced** on the right side and select a role or enter a display name to search for the user that you want to manage.
6. Click the username to view the basic information and the resource sets to which it belongs.

1.1.8.4.1.3. Modify user information

You can modify user information such as the display name, mobile number, and email address to keep it up to date.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and click **Edit** in the **Actions** column.
6. In the **Edit User** dialog box, modify the relevant information and click **OK**.

1.1.8.4.1.4. Change user roles

You can add, change, and delete roles for a user.

Change user roles by using user management

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and choose **More** > **Authorize** in the **Actions** column.
6. In the **Role** field, add, delete, or change user roles.

   You can enter role names in this field. Fuzzy match is supported.
7. Click **OK**.

Change user roles by changing ownership

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Changes**.
4. Click the  icon to the left of the organization that you want to manage and click **Users**.
5. In the right-side **Users** section, specify a **logon policy**, a **role**, or a **username**. Then, click **Search** to find the user that you want to change.
6. Find the user and click **Change** in the **Actions** column.
7. In the **Organization to Change** dialog box, select the original or a new organization and select the role to be added or removed from the **Assigned Roles** drop-down list.

> **Note** If you change only roles without changing the organization, select the original organization.

8. Click **OK**.

1.1.8.4.1.5. Modify the information of a user group

On the Users page, you can view the user group information and modify the ownership of users in user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab, select the user that you want to modify, and then click **More** in the **Actions** column.
   - Select **Add to User Group**. In the dialog box that appears, select a user group and click **OK** to add the user to the user group.
   - Select **Remove from User Group**. In the dialog box that appears, select a user group and click **OK** to remove the user from the user group.

1.1.8.4.1.6. Modify a user logon policy

An administrator can modify a user logon policy to control the permitted logon time and IP addresses of the user.

Prerequisites

A new logon policy is created. For more information, see Create a logon policy.

Modify the logon policy of a single user

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Find the user that you want to modify and choose **More > Logon Policy** in the **Actions** column.
6. In the **Assign Logon Policy** dialog box, select a logon policy and click **OK**.

Modify multiple user logon policies at a time

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Select users that you want to modify.
6. In the lower-left corner of the page, click **Change Logon Policy**.
7. In the **Batch Assign Logon Policy** dialog box, select a logon policy and click **OK**.

1.1.8.4.1.7. View the initial password of a user

After a user is created, the system generates an initial password for the user.

Context

Organization administrators can view the initial passwords of all users in the organizations they manage.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Find the user that you want to manage and choose **More** > **View Initial Password** in the **Actions** column.

> **Note** After the initial password is changed, the initial password is not displayed.

1.1.8.4.1.8. Reset the password of a user

If users forget their logon passwords, the organization administrator can reset the logon passwords for them.

Prerequisites

Only organization administrators can reset the password of a user.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an organization administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the user for which you want to reset the password.
5. In the **User Information** panel, click **Reset password**.

   After the password is reset, a message is displayed, which indicates that the password has been reset.

1.1.8.4.1.9. Disable or enable a user account

You can disable a user account to prevent the user account from logging on to the Apsara Uni-manager Management Console. User accounts that are disabled must be re-enabled before they can be used to log on to the Apsara Uni-manager Management Console again.

Context

By default, user accounts are enabled when they are created.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Perform the following operations on the current tab:
   - Select a user account whose **Status** is **Enabled** and click **Disable** in the **Actions** column. In the **Are you sure that you want to disable the specified user** message, click **Disable** to disable the user account.
   - Select a user whose **Status** is **Disabled** and click **Enable** in the **Actions** column. In the **Are you sure you want to enable the specified user** message, click **Enable** to enable the user account.

1.1.8.4.1.10. Delete a user

You can delete a specific user as an administrator.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **System Users** tab.
5. Find the user that you want to delete and choose **More** > **Delete** in the **Actions** column.
6. In the **Confirm** message, click **OK**.

1.1.8.4.2. Historical users

1.1.8.4.2.1. Query historical users

You can query deleted users.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **Historical Users** tab.
5. Enter the username that you want to query in the **Username** search box and click **Search**.

> **Note** Fuzzy search is supported.

1.1.8.4.2.2. Restore historical users

An administrator can restore a deleted user account from the **Historical Users** tab.

Context

The basic information such as the logon password of a restored user is the same as it was before the user was deleted, except for its organization and role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > Users**.
4. Click the **Historical Users** tab.
5. Find the user that you want to restore and click **Restore** in the **Actions** column.
6. In the **Restore User** dialog box, select an organization and a role.
7. Click **OK**.

1.1.8.5. Access control management

1.1.8.5.1. Create an access policy

To improve the security of the Apsara Uni-manager Management Console, you can create an access policy as an administrator to control logon access based on the logon time and IP addresses of users.

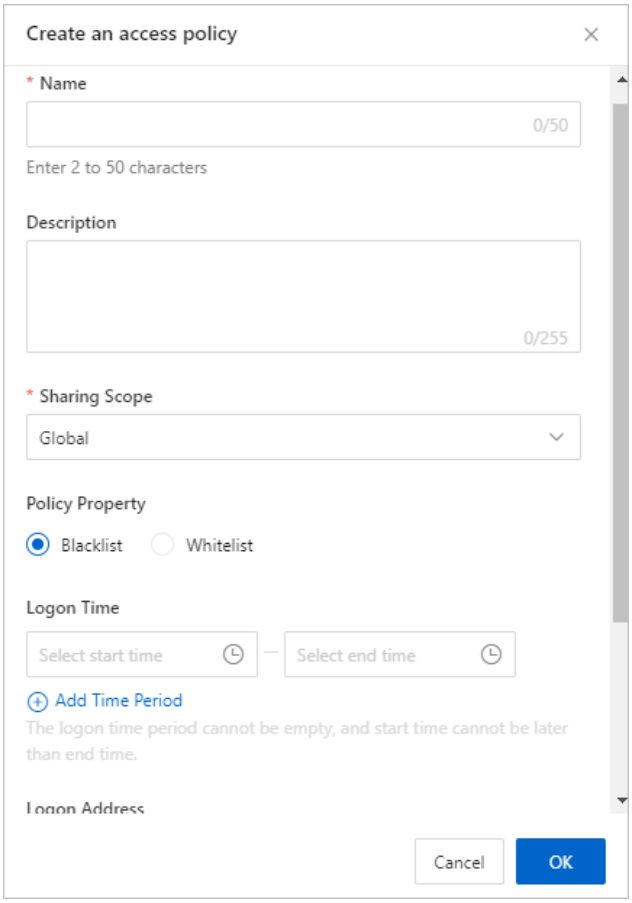
Context

Access policies are used to control the time periods and IP addresses valid for user logon. After a user is bound to an access policy, user logons are limited based on the logon time and IP addresses specified in the policy.

The default policy generated by the Apsara Uni-manager Management Console does not have limits on the time and IP addresses valid for user logon. This policy cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.
4. Click **Create an access policy** in the upper-right corner.
5. In the **Create an access policy** dialog box, set Name, Sharing Scope, Policy Property, Logon Time, and Logon Address.



Parameters for creating an access policy

Parameter	Description
Name	The name of the access policy. The name must be 2 to 50 characters in length and can contain only letters and digits. The name must be unique in the system.
Description	The description of the access policy.

Parameter	Description
Sharing Scope	The scope in which the role is visible. Valid values: ○ **Global**: The role is globally visible. The default value is Global. ○ **Current Organization**: The role is visible only in the current organization and is invisible in subordinate organizations. ○ **Subordinate Organization**: The role is visible in the current organization and all its subordinate organizations.
Policy Property	The authentication method of the access policy. Valid values: ○ **Whitelist**: Logon is allowed if the parameter settings are met. ○ **Blacklist**: Logon is denied if the parameter settings are met.
Logon Time	The permitted logon time period. If this policy is configured, users can log on to the Apsara Uni-manager Management Console only within the configured period. Specify the time period in minutes in a 24-hour clock. Example: `16:32`. **Note** When the Policy Property parameter is set to Whitelist, you can select No Time Limit.
Logon Address	The permitted CIDR block. ○ If the **Policy Property** parameter is set to **Whitelist**, IP addresses within this CIDR block are allowed to log on to the Apsara Uni-manager Management Console. ○ If the **Policy Property** parameter is set to **Blacklist**, IP addresses within this CIDR block are not allowed to log on to the Apsara Uni-manager Management Console. **Note** When the Policy Property parameter is set to Whitelist, you can select No CIDR Block Limit.

6. Click **OK**.

1.1.8.5.2. Query access policies

You can query the detailed information of an access policy in the Apsara Uni-manager Management Console.

Context

When the Apsara Uni-manager Management Console provides services, it automatically generates a default policy without limits on the logon time and IP addresses.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.
4. Enter the name of the policy that you want to view and click **Search**.

   View the access policy, including the permitted logon time and IP addresses.

You can click the following icons in the upper-right corner to manage the access policy list.

Icon	Description
	Shows the list in full screen mode. You can click the icon in the upper-right corner to exit the full screen mode.
	Selects the size of cells and fonts in the list. Valid values: • Default • Compact
	Refreshes the access policy list.
	Selects or clears check boxes to determine the items to be displayed in the list. You can also click **Reset** to restore the list to its original settings.

1.1.8.5.3. Modify a logon policy

You can modify the policy name, policy properties, permitted logon time period, and IP addresses of a logon policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.
4. Find the policy that you want to modify and click **Modify** in the **Actions** column.
5. In the **Modify an access policy** dialog box, modify the information of the policy.
6. Click **OK**.

1.1.8.5.4. Disable an access policy

You can disable access policies that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.
4. Find the access policy that you want to disable and click **Disable** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.8.5.5. Enable a logon policy

You can re-enable disabled logon policies.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.

4. Find the policy that you want to enable and click **Enable** in the **Actions** column.

1.1.8.5.6. Delete an access policy

You can delete access policies that are no longer needed.

Prerequisites

The access policy to be deleted is not bound to users. If an access policy is bound to a user, the access policy cannot be deleted.

Context

> **Note** The default policy cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Permission Policies**.
4. Find the policy that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.8.6. User groups

1.1.8.6.1. Create a user group

You can create a user group in a selected organization and batch authorize users within the group.

Prerequisites

An organization is created. For more information, see Create an organization.

Context

Relationships between user groups and users:

- A user group can contain zero or more users.
- A user does not need to belong to a user group.
- You can add a user to multiple user groups.

Relationships between user groups and organizations:

- A user group belongs to only a single organization.
- You can create multiple user groups within an organization.

Relationships between user groups and roles:

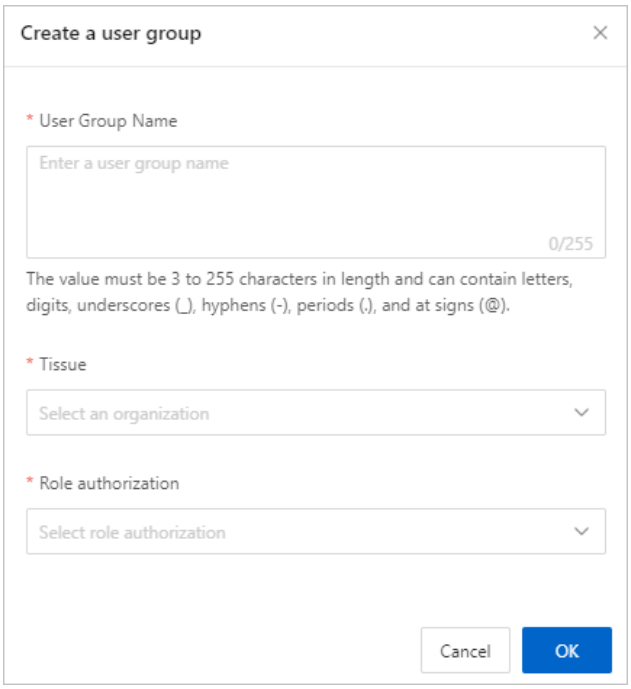
- A role can be assigned to multiple user groups.
- When a role is assigned to a user group, the permissions that the role has are automatically granted to users within the user group.

Relationships between user groups and resource sets:

- You can add zero or more user groups to a resource set.
- A user group can be added to multiple resource sets.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Click **Create a user group** in the upper-left corner.
5. In the dialog box that appears, set **User Group Name**, **Tissue**, and **Role authorization**.



Parameter	Description
User Group Name	The name of the user group. The name must be 3 to 255 characters in length and can contain letters, digits, underscores (_), hyphens (-), periods (.), and at signs (@).
Tissue	The organization to which the user group belongs.
Role authorization	The roles that are assigned to the user group.

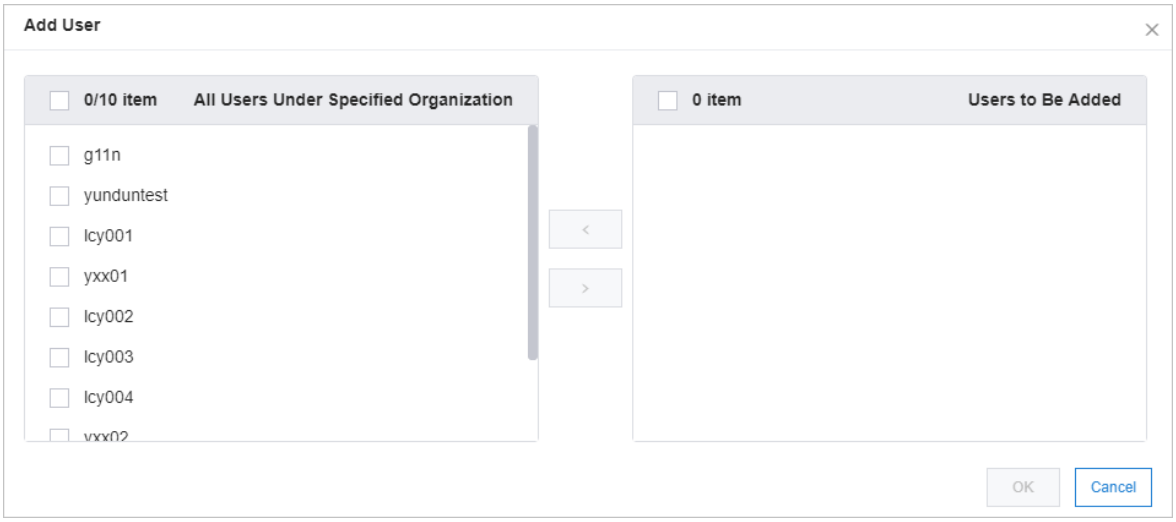
6. Click **OK**.

1.1.8.6.2. Add users to a user group

You can add users to a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Find the user group to which you want to add users and click **Add User** in the **Actions** column.
5. Select users to be added in the left-side section and click the right arrow to move them to the right-side section.



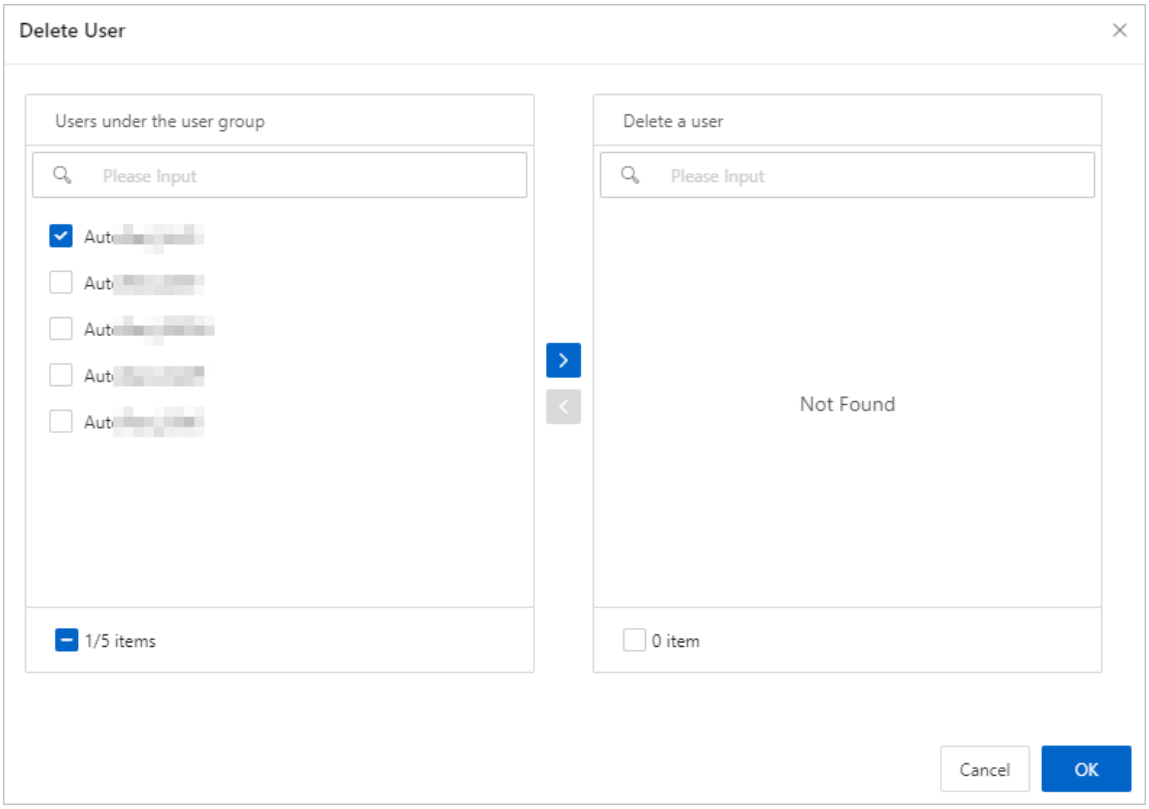
6. Click **OK**.

1.1.8.6.3. Remove a user

You can remove users from a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Find the user group from which you want to remove a user and choose **More** > **Remove User** in the **Actions** column.
5. Select the user that you want to remove in the **Users under the user group** section and click the right arrow to move the user to the **Remove User** section.



6. Click **OK**.

1.1.8.6.4. Add or remove a role

You can add a role to a user group to grant the role permissions to all users within the group. You can also remove a role from a user group to revoke the role permissions from all users within the group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Find the user group that you want to manage and choose **More** > **Authorized** in the **Actions** column.
5. In the **Authorized** dialog box, set **Role authorization**.
6. In the drop-down list, you can select or clear a role to grant permissions to or revoke permissions from the user group.
7. Click **OK**.

1.1.8.6.5. Modify the name of a user group

You can modify the names of user groups.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Find the user group that you want to modify and click **Editing** in the **Actions** column.

5. In the dialog box that appears, modify **User Group Name**.
6. Click **OK**.

1.1.8.6.6. Delete a user group

You can delete user groups that are no longer needed.

Prerequisites

The user group to be deleted is unbound from all roles. If a role is bound to a user group, the user group cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users > User Groups**.
4. Find the user group that you want to delete and choose **More** > **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.8.7. Region management

1.1.8.7.1. Update associations

The Apsara Uni-manager Management Console allows you to manage resources across regions. You can update the associations between organizations and regions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Regions**.
4. In the left-side organization navigation tree, click the name of the organization that you want to update.
5. In the right-side **Regions** section, select the names of regions to be associated.
6. Click **Update Association**.

1.1.8.8. Change the ownership of an instance

If you want to transfer resource instances to another resource set within the same organization, you can change the resource set ownership of the instances.

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Resources > Changes**.
4. Click the + icon to the left of the organization that you want to manage and click a resource set.
5. In the right-side **Product Type** section, click the name of the service that contains the instance you want to manage.
6. Set **Resource Type**, enter the instance ID or name in the search box, and then click **Search** to search for the instance.
7. Click **Change Ownership** in the **Actions** column corresponding to the instance to change the ownership of the instance to another resource set.

8. In the **Change Resource Set** dialog box, select the desired resource set and click **OK**.

1.1.8.9. Cloud instances

1.1.8.9.1. Manage Apsara Stack cloud instances

1.1.8.9.1.1. Export data of the current cloud

You can export the data of secondary Apsara Stack nodes to a configuration file. This can be used by the primary node to manage nodes in a centralized manner.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Click **Collect Data of Current Cloud** to collect the deployment information of the current cloud.
6. Click **Export** to export the information in the JSON format.

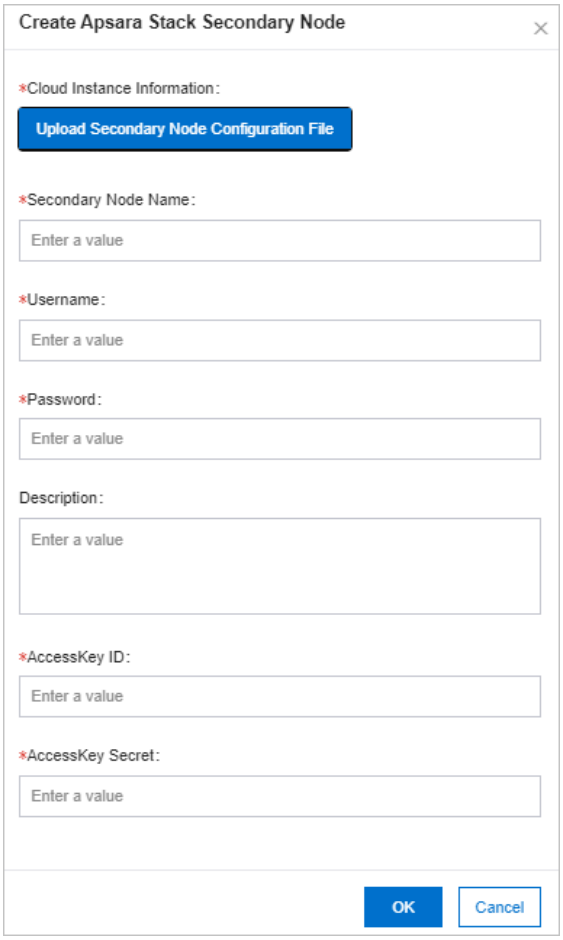
1.1.8.9.1.2. Add a secondary Apsara Stack node

You can add the configuration information of secondary Apsara Stack nodes to the multi-cloud configuration of the primary Apsara Stack node for centralized management.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Click **Import**.

6. In the **Create Apsara Stack Secondary Node** dialog box, enter the configuration information of a secondary node and click **OK**.



Parameter	Description
Cloud Instance Information	The configuration file of the secondary node. For more information, see Export data of the current cloud.
Secondary Node Name	The name of the secondary node.
Username	The username of the operations administrator that manages the secondary node.
Password	The password of the operations administrator that manages the secondary node.
Description	The description of the secondary node.

Parameter	Description
AccessKey ID	The AccessKey ID of the operations administrator that manages the secondary node. For more information, see View the AccessKey pair of your Apsara Stack tenant account.
AccessKey Secret	The AccessKey secret of the operations administrator that manages the secondary node. For more information, see View the AccessKey pair of your Apsara Stack tenant account.

> **Notice**
> You must create an operations administrator account in the secondary node. This account is for dedicated use by the primary node and cannot be the default operations administrator account.

1.1.8.9.1.3. View managed cloud instances

You can use the multi-cloud management feature to view the details of all managed cloud instances.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.

   You can view the name, description, cloud type, cloud role, and address of all managed cloud instances.
5. Enter a cloud instance name in the search box and click **Search** to search for the cloud instance.
6. Click **View Details** in the **Actions** column corresponding to the cloud instance.

   In the Manage Cloud Instance message, you can view the version, Apsara Stack API (ASAPI) address, and region of the cloud.

1.1.8.9.1.4. Modify a cloud instance

If you want to change the information of a cloud instance for more efficient management, you can modify it in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Enter the name of the cloud instance that you want to modify in the search box and click **Search** to search for the cloud instance.
6. Click **Edit** in the **Actions** column corresponding to the cloud instance.

7. In the **Edit Cloud Instance** dialog box, set **Cloud Name**, **Username**, **Password**, **Description**, **AccessKey ID**, **AccessKey Secret**, **Longitude**, and **Latitude**, and click **OK**.

1.1.8.9.1.5. Manage cloud instances

You can manage Apsara Stack cloud instances to check whether they can be connected.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **Apsara Stack Management** tab.
5. Enter a cloud instance name in the search box and click **Search** to search for the cloud instance.
6. Click **Manage** in the **Actions** column corresponding to the cloud instance.
7. In the **Manage Cloud Instance** dialog box, click **Test Connectivity**.

1.1.8.9.2. Manage VMware nodes

1.1.8.9.2.1. Add a VMware node

You can add the configuration information of VMware nodes to the Apsara Stack VMware management configuration for centralized management.

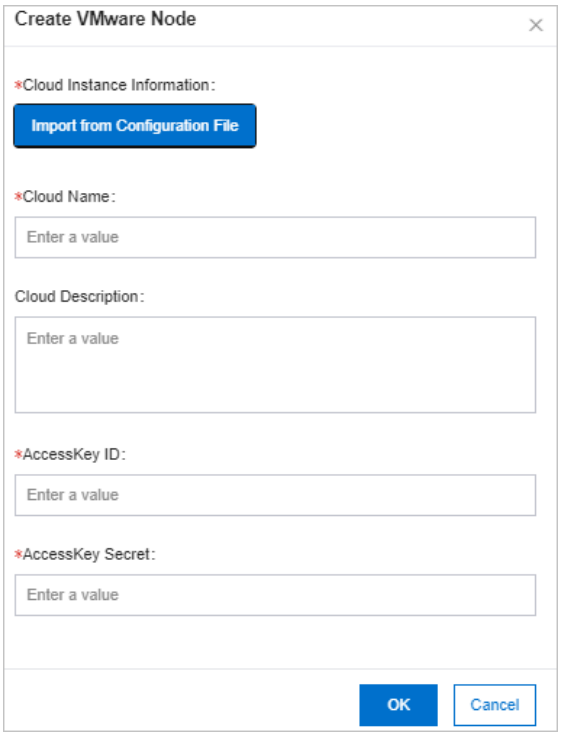
Prerequisites

- The configuration file of a VMware node is obtained from the deployment personnel.
- The VMware node is configured.

Procedure:

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.
5. Click **Create VMware Node**.

6. In the **Create VMware Node** dialog box, enter the configuration information of a VMware node and click **OK**.



Parameter	Description
Cloud Instance Information	The configuration file of the VMware node.
Cloud Name	The name of the VMware node.
Cloud Description	The description of the VMware node.
AccessKey ID	The AccessKey ID in the configuration file of the VMware node.
AccessKey Secret	The AccessKey secret in the configuration file of the VMware node.

1.1.8.9.2.2. Modify a VMware node

If you want to change the information of a VMware node for more efficient management, you can modify it in the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.

5. Enter the name of the VMware node that you want to modify in the search box and click **Search** to search for the VMware node.
6. Click **Edit** in the **Actions** column corresponding to the VMware node.
7. In the **Edit Cloud Instance** dialog box, set **Cloud Name**, **Cloud Description**, **AccessKey ID**, and **AccessKey Secret**, and click **OK**.

1.1.8.9.2.3. Test VMware node connectivity

You can manage VMware nodes to check whether they can be connected.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane of the Enterprise page, click **Cloud Instances**.
4. Click the **VMware Management** tab.
5. Enter a VMware node name in the search box and click **Search** to search for the VMware node.
6. Click **Manage** in the **Actions** column corresponding to the VMware node.
7. In the **Manage Cloud Instance** dialog box, click **Test Connectivity**.

1.1.8.10. Data permissions

1.1.8.10.1. Overview

Data permission management allows you to specify which users can access instances of a specific service, grant data access permissions to the users, and view and modify the data permissions in all the RAM policies attached to specified users.

Apsara Stack controls users and permissions by managing their visibility and operability in the Apsara Uni-manager Management Console. Many Apsara Stack cloud services are directly used by calling their API operations or SDKs instead of in the console. In this case, data access permissions must be controlled by RAM permission verification provided by the cloud services.

RAM policies are configured for such cloud service instances for access control. Automatic judgment is used when personnel are added to or removed from resource sets. However, this judgement method can affect performance and has a high error rate in complex scenarios. To solve this problem, the authorization of cloud services that require data access permissions is separately managed. Organization administrators can configure the data permissions granted to related personnel on the data authorization page.

1.1.8.10.2. Set the data permissions of resource instances

Organization administrators can set the data permissions of resource instances to allow or deny access to and operations on cloud services in the Apsara Uni-manager Management Console.

Prerequisites

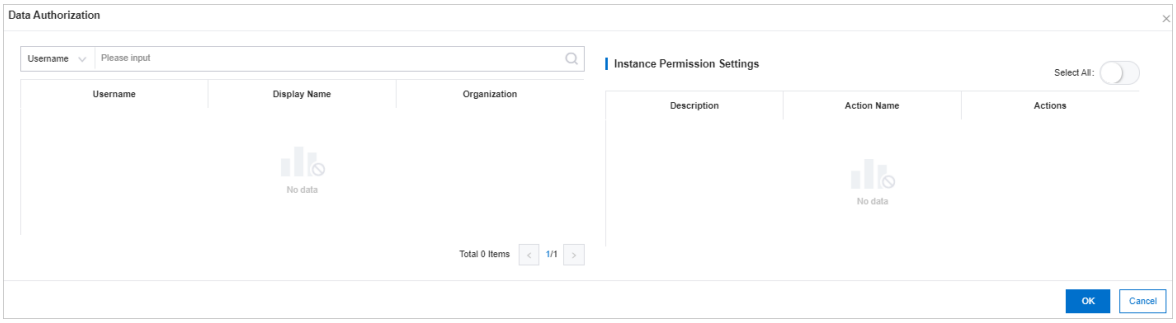
The cloud services that support data authorization include Message Queue (MQ), Object Storage Service (OSS), Log Service, DataHub, Container Service for Kubernetes, and Key Management Service (KMS).

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane, choose **Permissions** > **Data Permissions**.
4. Click the resource set that you want to manage and click a service type on the right side of the page.
5. Find the instance that you want to manage and click **Authorize** in the **Actions** column.
6. In the **Data Authorization** dialog box, select the user that you want to manage on the left side.
7. Turn on or off the data permission switches in the Actions column on the right side.

   You can also select or clear Enable All to batch manage permissions.



8. Click **OK**.

1.1.8.10.3. Edit user permissions

You can use JSON statements to edit user permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions** > **Data Permissions**.
4. In the organization navigation tree, click the icon to the left of the organization that contains the user you want to manage.
5. Click **Users**.
6. Enter the username in the search box and click **Search**.
7. Click **Edit Permissions** in the **Actions** column corresponding to the user.
8. In the Edit Permissions dialog box, select a data permission on the left side and click OK.

   If no permissions are available, specify a policy in the text editor. For more information about the syntax and structure of a policy, see Permission policy structure and syntax.

1.1.8.10.4. View the permissions of a user

You can view the existing permissions of a user.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions** > **Data Permissions**.
4. In the organization navigation tree, click the icon to the left of the organization that contains the user you want to manage.

5. Click **Users**.
6. Enter the username in the search box and click **Search**.
7. Click **View Permissions** in the **Actions** column corresponding to the user.

1.1.9. Configurations

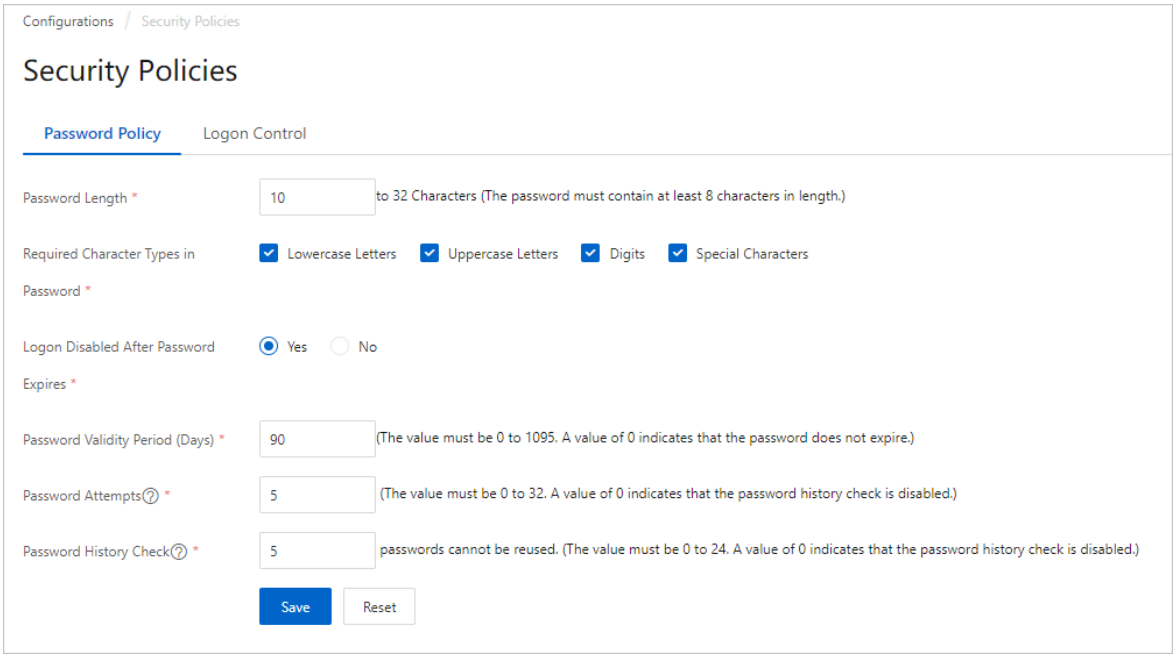
1.1.9.1. Security policies

1.1.9.1.1. Configure password policies

You can configure password policies for user logons.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Security Policies**.
4. Click the **Password Policy** tab.
5. On the **Password Policy** tab, set the password policy parameters.



Parameter	Description
Password Length	The minimum length of the password. Minimum value: 8.
Required Character Types in Password	The character types that must be contained in the password. You can select multiple options.
Logon Disabled After Password Expires	Specifies whether to allow logon after the password expires.
Password Validity (Days)	The validity period of the password. Unit: days. Maximum value: 1095. A value of 0 indicates that the password never expires.

Parameter	Description
Password Attempts	The maximum number of logon attempts within 1 hour. Maximum value: 32. After the maximum number is reached, the account is locked and cannot be used to log on for a specific period of time.
Password History Check	The number of previous passwords that cannot be reused. Maximum value: 24. A value of 0 indicates the password history check is disabled.

6. Click **Save**.

   To restore to the default password policy, click **Reset**.

1.1.9.1.2. Configure logon control

You can limit the access from multiple clients of users.

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Security Policies**.
4. Click the **Logon Control** tab.
5. Perform the following operations:
   - Select **Single Session**. A single session means that a user is allowed to log on only by using a single client at the same time.
   - Select **Multi-session**. A multi-session means that a user is allowed to log on by using multiple clients at the same time.

1.1.9.2. Menus

1.1.9.2.1. Create a menu

You can create a menu and add its URL to the Apsara Uni-manager Management Console for quick access.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Menu Settings**.
4. On the **Main Menu** page, click **Create** in the upper-right corner.
5. In the **Create** dialog box, configure the menu parameters.

   Menu parameters

Parameter	Description
Title	The display name of the menu.
URL	The URL of the menu.

Parameter	Description
Console Type	Different console types correspond to different domain names. Valid values: ◦ **oneconsole**: You need only to enter the path in the URL field. The domain name is automatically matched. The URL starts with `one.console`. ◦ **asconsole**: You need only to enter the path in the URL field. The domain name is automatically matched. The URL starts with `asc.`. ◦ **asconsole 2.0**: You need only to enter the path in the URL field. The domain name is automatically matched. The URL starts with `one.console`. ◦ **other**: You must enter the domain name in the URL field.
Icon	The icon displayed in the left-side navigation pane. The icon cannot be changed.
Identifier	The unique identifier of the menu in the system. This identifier can be used to indicate whether the menu is selected in the navigation bar. The identifier cannot be changed.
Sort	The display order among the same-level menus. The larger the value, the lower the display order. Leave the Order field empty.
Parent Level	The displayed tree structure.
Open With	Specifies whether to open the menu in the current window or in a new window.
Description	The description of the menu.

6. Click **OK**.

1.1.9.2.2. Modify a menu

You can modify an existing menu, including the menu name, URL, icon, and menu order.

Prerequisites

Default menus cannot be modified.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Menu Settings**.
4. Find the menu that you want to modify and click **Edit** in the **Actions** column.
5. In the **Edit** dialog box, modify the information of the menu.

   For information about the menu parameters, see Create a menu.
6. Click **OK**.

1.1.9.2.3. Delete a menu

You can delete menus that are no longer needed.

Prerequisites

Default menus cannot be deleted.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.

2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. Find the menu that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.9.2.4. Show or hide menus

You can perform the following operations to show or hide menus:

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Menu Settings**.
4. Select or clear the check box in the **Displayed** column corresponding to a menu.

1.1.9.3. Specifications

1.1.9.3.1. Specification parameters

This topic describes the specification parameters of each resource type.

NAT Gateway

Parameter	Description
Specifications	The specifications that can be configured for NAT Gateway.
Specifications Description	The description of the specifications that can be configured for NAT Gateway.

AnalyticDB for PostgreSQL

Parameter	Description
Specifications	The specifications that can be configured for AnalyticDB for PostgreSQL.
Specifications Name	The name of the instance type that can be configured for AnalyticDB for PostgreSQL.
CPU	The total number of CPU cores that can be configured for AnalyticDB for PostgreSQL.
Memory	The memory size that can be configured for AnalyticDB for PostgreSQL.
Storage Space	The total storage size that can be configured for AnalyticDB for PostgreSQL.
Version	The version number of AnalyticDB for PostgreSQL.
Node	The number of nodes that can be configured for AnalyticDB for PostgreSQL.

SLB

Parameter	Description
Specifications	The instance type that can be configured for Server Load Balancer (SLB).
Specifications Name	The name of the instance type that can be configured for SLB.
Maximum Connections	The maximum number of connections that can be configured for SLB.
New Connections	The number of new connections that can be configured for SLB.
QPS	The queries per second (QPS) that can be configured for SLB.
Description	The description of the specifications that can be configured for SLB.

ApsaraDB RDS

Parameter	Description
Engine Type	The engine type that can be configured for ApsaraDB RDS.
Minimum Storage (GB)	The minimum amount of storage space that can be configured for ApsaraDB RDS.
Maximum Storage (GB)	The maximum amount of storage space that can be configured for ApsaraDB RDS.
Specifications Name	The name of the instance type that can be configured for ApsaraDB RDS.
Version	The version number of ApsaraDB RDS.
CPUs	The number of CPU cores that can be configured for ApsaraDB RDS.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB RDS.
Memory (GB)	The memory size that can be configured for ApsaraDB RDS.
Share Type	The share type that can be configured for ApsaraDB RDS.

PolarDB-X

Parameter	Description
Instance Type	The instance type that can be configured for PolarDB-X.
Instance Type Name	The name of the instance type that can be configured for PolarDB-X.

Parameter	Description
Specifications	The specifications that can be configured for PolarDB-X.
Specifications Name	The name of the specifications that can be configured for PolarDB-X.

ECS

Parameter	Description
Instance Family	The instance family that is divided into different instance types based on the scenarios for which they are suitable.
Specifications Level	The level of the instance type that can be configured for Elastic Compute Service (ECS).
vCPUs	The maximum number of vCPUs that can be configured for ECS.
Memory (GB)	The memory size that can be configured for ECS.
Instance Specifications	The instance type that can be configured for ECS.
GPU Type	The GPU type that can be configured for ECS.
GPUs	The number of GPUs that can be configured for ECS.
Supported ENIs	The number of elastic network interface (ENIs) that can be configured for ECS.
Number Of Private IP Addresses	The number of private IP addresses that can be configured for ECS.

KVStore for Redis

Parameter	Description
Specifications Name	The name of the specifications that can be configured for KVStore for Redis.
Instance Specifications	The instance type that can be configured for KVStore for Redis.
Maximum Connections	The maximum number of connections that can be configured for KVStore for Redis.
Maximum Bandwidth	The maximum bandwidth that can be configured for KVStore for Redis.
CPUs	The number of CPU cores that can be configured for KVStore for Redis.
Version	The version number of KVStore for Redis.
Architecture	The architecture of KVStore for Redis.
Node Type	The node type of KVStore for Redis.

Parameter	Description
Service Plan	The service plan that can be configured for KVStore for Redis.

ApsaraDB for MongoDB

Parameter	Description
Specifications	The instance type that can be configured for ApsaraDB for MongoDB.
Instance Specifications	The name of the specifications that can be configured for ApsaraDB for MongoDB.
Engine Type	The engine type that can be configured for ApsaraDB for MongoDB.
Version	The version number of ApsaraDB for MongoDB.
Serial Number	The serial number of ApsaraDB for MongoDB.
Sequence Description	The description of the serial number of ApsaraDB for MongoDB.
Maximum Connections	The maximum number of connections that can be configured for ApsaraDB for MongoDB.
IOPS	The IOPS of ApsaraDB for MongoDB.
Storage Space	The amount of storage space that can be configured for ApsaraDB for MongoDB.
Minimum Storage	The minimum amount of storage space that can be configured for ApsaraDB for MongoDB.
Maximum Storage	The maximum amount of storage space that can be configured for ApsaraDB for MongoDB.

1.1.9.3.2. Create specifications

You can customize specifications for each resource type.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Specifications**.
4. Select the resource type for which you want to create specifications and click the **Resource Specifications** tab.
5. On the **Resource Specifications** tab, click **Create Specifications** in the upper-left corner.
6. In the dialog box that appears, configure the specifications parameters.

   For more information, see Specification parameters.
7. Click **OK**.

1.1.9.3.3. View specifications

You can view the specifications of each resource type.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Click the resource type for which you want to view specifications.
5. On the **Resource Specifications** tab, set a **region**, **column**, and **value**. The corresponding information is displayed in the specifications list.
6. Click the **Existing Specifications** tab and view the existing specifications and their quantity.

1.1.9.3.4. Disable specifications

By default, newly created specifications are in the Enabled state.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.
4. Select the resource type for which you want to disable specifications.
5. Click **Disable** in the **Actions** column corresponding to the specifications that you want to disable.
6. In the message that appears, click **OK**.

1.1.9.3.5. Export specifications

You can export specifications that you want to view and share.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Specifications**.
4. Select the resource type for which you want to export specifications.
5. Click the **Resource Specifications** tab and click **Export** in the upper-right corner to save the specifications to your computer as a CSV file.

1.1.9.3.6. View specifications of each resource type in previous versions

You can view specifications of each resource type in previous versions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane of the **Configurations** page, click **Specifications**.

4. On the **Specifications** page, click the resource type for which you want to view specifications.
5. Click the **Specifications History** tab. View the detailed information in the specifications list.

1.1.9.4. Message center

1.1.9.4.1. View internal messages

You can view all internal messages, including read and unread messages.

Context

When changes are made to or alerts are generated for an instance in a resource, all users that have read and operation permissions on this resource receive corresponding messages.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, click the target message scope.
   - Choose **Internal Messages > All Messages** to view all messages, including unread and read messages.
   - Choose **Internal Messages > Unread Messages** to view unread messages.
   - Choose **Internal Messages > Read Messages** to view read messages.

1.1.9.4.2. Mark messages as read

You can mark unread messages as read messages to facilitate message management.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, choose **Internal Messages > Unread Messages**.

   In the upper part of the **Unread Messages** page, click different message types to filter messages.
4. On the Unread Messages page, find the message that you want to mark as read and click **Mark as Read** in the **Actions** column.

   You can also select the check boxes to the left of messages and click **Batch Read** in the upper-left corner of the page.
5. In the **Mark as Read** message, click **OK**.

1.1.9.4.3. Delete a message

You can delete messages that are no longer needed.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, move the pointer over the icon and click **More**.
3. In the left-side navigation pane of the **Message Center** page, choose **Internal Messages > All Messages**.

4. Find the message that you want to delete on the All Messages tab or other tabs and click **Delete**.

   You can also select the check boxes to the left of messages and click **Batch Delete** in the upper-left corner of the page.

1.1.9.5. Resource pool management

You can modify the maximum usage of each resource.

Prerequisites

- If the physical inventory is unlimited, the logical inventory cannot be less than the used inventory.
- If the physical inventory is limited, the logical inventory cannot be less than the used inventory and cannot be greater than the physical inventory.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Resource Pool Configuration**.
4. On the right side of the **Resource Pools** page, click the service that you want to modify.

   You can also click the name of a service on the left side of the page.
5. Find the service that you want to modify, and click the icon in the Logical Inventory column, and then modify resource quantities of the service.
6. Click the icon to complete modification.

1.1.9.6. Custom configurations

1.1.9.6.1. Configure brands

You can customize the icon, platform name, and logon page of the Apsara Uni-manager Management Console.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a platform administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Custom Configurations**.
4. In the **Brand Settings** section, click the language tab of the page that you want to modify.
5. Configure the following parameters and click **OK**.

Parameter	Description

Parameter	Description
Browser ICO Image	You can click **Upload Image**, select an image file, and then click **Open**. We recommend that you select an image whose resolution is 160 × 36 pixels in the PNG or JPG format. After the image is uploaded, you can click the icon to preview it. Before you upload a new image, you must click the icon to delete the existing image.
Platform Logo	You can click **Upload Image**, select an image file, and then click **Open**. We recommend that you select an image whose resolution is 160 × 36 pixels in the PNG or JPG format. After the image is uploaded, you can click the icon to preview it. Before you upload a new image, you must click the icon to delete the existing image.
Platform Name	You can customize a platform name. The name can be up to 8 characters in length.
Logon Page	You can click + Add Screen to increase the number of scrolling screens. You can also click the icon to the left of a screen to decrease the number of scrolling screens. One to three scrolling screens can be allowed on the logon page. After you click the tab of a screen, you can perform the following operations: ◦ **Background Image**: Click Upload Image, select a background image file, and then click Open. We recommend that you select an image whose resolution is 1,880 × 1,600 pixels in the PNG or JPG format. After the image is uploaded, you can click the icon to preview it. Before you download a new image, you must click the icon to delete the existing image. ◦ **Image Copywriting**: Customize the image content. The image content can be up to 40 characters in length.
Copyright Notice	You can customize the information of the copyright notice.

1.1.10. Operations

1.1.10.1. Quotas

1.1.10.1.1. Quota parameters

This topic describes the quota parameters of each service.

An organization administrator can set resource quotas and create resources within the allowed quotas for its organization. When the quotas for the organization are used up, the system does not allow the organization administrator to create more resources for the organization. To create more resources, you must first increase the quotas for the organizations.

If no quotas are set, you can create an unlimited amount of resources.

ECS

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for Elastic Compute Service (ECS) and the number of used cores.
Memory quota (G)	The total memory size that you can configure for ECS.
GPU quota (number of cards)	The total number of GPU cores that you can configure for ECS.
SSD quota (G)	The total SSD capacity that you can configure for ECS.
Efficient cloud disk quota (G)	The total number of disks that you can configure for an ECS instance.

VPC

Parameter	Description
VPC quota (units)	The maximum number of virtual private clouds (VPCs) that you can configure.

OSS

Parameter	Description
OSS quota (G)	The maximum capacity that you can allocate for Object Storage Service (OSS).

ApsaraDB RDS for MySQL

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for ApsaraDB RDS for MySQL and the number of used cores.
Memory quota (G)	The total memory size that you can configure for ApsaraDB RDS for MySQL.
Disk quota (G)	The total storage size that you can configure for ApsaraDB RDS for MySQL.

PolarDB

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for PolarDB and the number of used cores.
Memory quota (G)	The total memory size that you can configure for PolarDB.
Disk quota (G)	The total storage size that you can configure for PolarDB.

ApsaraDB RDS for SQL Server

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for ApsaraDB RDS for SQL Server and the number of used cores.
Memory quota (G)	The total memory size that you can configure for ApsaraDB RDS for SQL Server.
Disk quota (G)	The total storage size that you can configure for ApsaraDB RDS for SQL Server.

ApsaraDB RDS for PostgreSQL

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for ApsaraDB RDS for PostgreSQL and the number of used cores.
Memory quota (G)	The total memory size that you can configure for ApsaraDB RDS for PostgreSQL.
Disk quota (G)	The total storage size that you can configure for ApsaraDB RDS for PostgreSQL.

SLB

Parameter	Description
VIP quota (units)	The maximum number of internal IP addresses that you can configure for Server Load Balancer (SLB).
Public network VIP quota (units)	The maximum number of public IP addresses that you can configure for SLB.

EIP

Parameter	Description
EIP quota (units)	The maximum number of elastic IP addresses (EIPs) that you can configure.

MaxCompute

Parameter	Description

Parameter	Description
CU quota (units)	The total number of capacity units (CUs) that you can configure for MaxCompute.
Disk quota (G)	The total storage size that you can configure for MaxCompute.

KVStore for Redis

Parameter	Description
Memory quota (G)	The total memory size that you can configure for KVStore for Redis.

PolarDB-X

Parameter	Description
CPU quota (core)	The total number of CPUs that you can configure for PolarDB-X.

AnalyticDB for PostgreSQL

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for AnalyticDB for PostgreSQL and the number of used cores.
Memory quota (G)	The total memory size that you can configure for AnalyticDB for PostgreSQL.
Disk quota (G)	The total storage size that you can configure for AnalyticDB for PostgreSQL.

ApsaraDB for MongoDB

Parameter	Description
CPU quota (core)	The total number of CPU cores that you can configure for ApsaraDB for MongoDB and the number of used cores.
Memory quota (G)	The total memory size that you can configure for ApsaraDB for MongoDB.
Disk quota (G)	The total storage size that you can configure for ApsaraDB for MongoDB.

Dedicated hosts

Parameter	Description
DDH quota (units)	The number of dedicated hosts.

1.1.10.1.2. Set quotas for a cloud service

You can set quotas for each organization to allocate and manage resources for each organization in an appropriate manner.

Prerequisites

You must set quotas for a parent organization before you can set quotas for its subordinate organizations.

Context

If the parent organization (not including level-1 organizations) has quotas, the available quotas for a subordinate organization are equal to the quotas for the parent organization minus the quotas for other subordinate organizations.

This topic describes how to set quotas for Elastic Compute Service (ECS). You can set quotas for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an organization administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, click **Quotas**.
4. In the **Organizational Architecture** section, click the name of the organization that you want to manage.
5. Click **ECS**.
6. In the upper-right corner of the quota section, click the  icon.
7. Set the total quotas and click **Save**.

   For information about quota parameters, see Quota parameters.

1.1.10.1.3. Modify quotas

Administrators can adjust quotas for cloud resources based on their organizational requirements.

Context

This topic describes how to modify quotas for Elastic Compute Service (ECS). You can modify quotas for other cloud resources in a similar manner.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an organization administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, click **Quotas**.
4. In the **Organizational Architecture** section, click the name of the organization that you want to manage.
5. Click **ECS**.
6. In the upper-right corner of the quota section, click the  icon.
7. After you modify the quotas, click **Save**.

   For more information about specification parameters, see Quota parameters.

1.1.10.1.4. Reset quotas

Administrators can reset quotas to remove quota limits on cloud resources.

Prerequisites

Before you delete a quota for an organization, make sure that no subordinate organizations have quotas.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an organization administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, click **Quotas**.
4. In the **Organizational Architecture** section, click the name of the organization that you want to manage.
5. Click the cloud service for which to reset quotas.
6. In the upper-right corner of the quota section, click the icon.
7. In the message that appears, click **OK**.

1.1.10.2. Usage statistics

1.1.10.2.1. View the usage statistics of cloud resources

The Apsara Uni-manager Management Console shows the number of resource instances that run in the Apsara Stack environment by time, organization, resource set, and region. You can also export statistical reports from the Apsara Uni-manager Management Console.

Context

The following cloud resources can be measured: Elastic Compute Service (ECS), Virtual Private Cloud (VPC), Server Load Balancer (SLB), Object Storage Service (OSS), ApsaraDB RDS for MySQL, Elastic IP Address (EIP), Tablestore, PolarDB-X, KVStore for Redis, AnalyticDB for PostgreSQL, ApsaraDB for MongoDB, ApsaraDB RDS for PostgreSQL, ApsaraDB RDS for SQL Server, Log Service, ECS disks, ECS snapshots, scaling group rules, API gateways, Key Management Service (KMS), dedicated hosts, and ApsaraDB for OceanBase.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, click **Usage Statistics**.
4. Click **Elastic Compute Service**.
5. In the **query condition** section, specify a **time range** and click **Search**.

   You can also click **Advanced** in the upper-right corner, set **Tissue**, **Resource set**, **Geographical**, and **Instance ID**, and then click **Search**.

   > **Note** In the console, you can view or export up to 1,000 statistical records to an XLS file. If you want more statistical data, you can call the MeteringQuery operation.

6. (Optional)Click the icon to save the displayed information to your computer as an XLS file.

   The exported file is named *<Resource type name>.xls*. Find the downloaded file from the download path of the browser.

1.1.10.3. Statistical analysis

1.1.10.3.1. View reports of current data

You can use reports to view the most recent resources, quotas, and CloudMonitor data of each service.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Statistical Analysis** > **Reports**.
4. Click the tab that you want to view.

   You can click the **Resource Report**, **Quota report**, or **Cloudmonitor report** tab.
5. (Optional) Set **Organization and resource set** and **Geographical** and click **Search**.
6. Click the service that you want to view.

   View the most recent data of the service.

1.1.10.3.2. Export reports of current data

You can batch export the resources, quotas, or monitoring data that you want to view based on cloud service types.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Statistical Analysis** > **Reports**.
4. Click the tab that you want to view.

   You can click the **Resource Report**, **Quota report**, or **Cloudmonitor report** tab.
5. (Optional) Set **Organization and resource set** and **Geographical** for which you want to view data and click **Search**.

   Click **Reset** to clear all filter properties.
6. Use one of the following methods to export data:
   - Export data by service.
     a. Click the  icon on the right side.
     b. In the **Select the product to export** dialog box, select the service that you want to view and click **OK**.

        You can also select **Select All** in the lower-left corner and click **OK**.
   - Export data by instance.
     a. Click the name of the service that you want to view.
     b. Select the instance that you want to view and click **Export Selected reports** in the lower-left corner of the page.

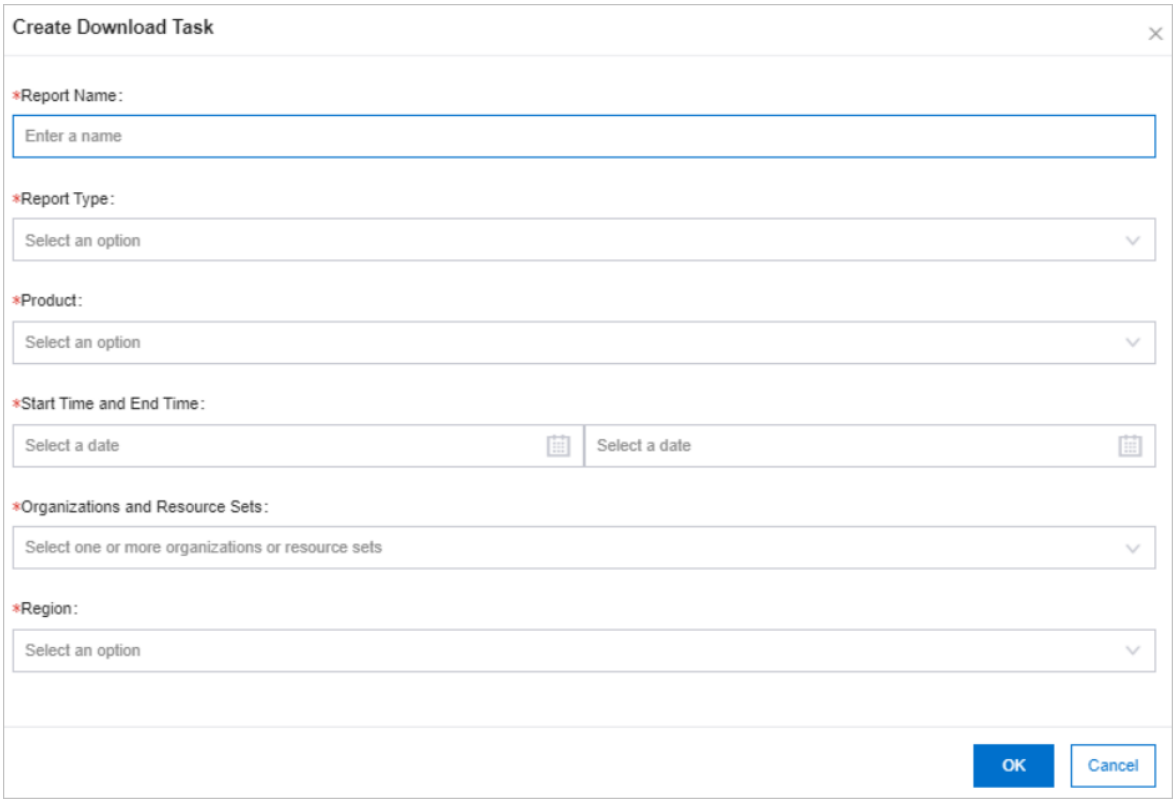
1.1.10.3.3. Download reports of historical data

You can download data reports of cloud services within the specified period of time, resource set, and region by creating download tasks.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane of the Operations page, choose **Statistical Analysis** > **Download Center**.

4. Click the icon in the upper-right corner.
5. Enter the information of the download task.



Parameter	Description
Report name	The name of the report.
Report type	The type of the report. Valid values: ○ Resource Report ○ Cloudmonitor report
Product	The cloud service for which you want to download reports. You can select multiple cloud services.
Start time and end time	The start time and end time of the data.
Organization Resource set	The organization to which the data belongs. You can select multiple organizations.
Area	The region of the data. You can select multiple regions.

6. Click **OK**.

7. After the **Creation successful** message appears, the Download Center page appears. Enter the information of the created report in the search box and click **Search** to search for the created download task.
8. After **In progress** changes to **Completed** in the **State** column, click **Download reports** in the Operation column.

1.1.10.4. Billing management

1.1.10.4.1. Billing overview

The billing system collects resource usage statistics for each service, organization, or resource set per month. You are charged for the consumed resources based on the billing rules.

Billing configurations

Billing configurations involve four terms to meet complex billing requirements. These configurations cover a variety of aspects such as basic prices, time policies, organization policies, and discount policies.

The following terms from bottom up are used for different billing logics:

- Billable item: specifies prices and billing methods.
- Billing rule: specifies the billing range of services.
- Billing policy: specifies organization policies and discount capabilities of services.
- Billing plan: specifies billing time policies and discount capabilities.

Billing overview

On the Billing overview page, you can view the numbers of billing plans, policies, and rules that are available and in use. You can also view the effective time of billing plans and policies.

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Overview**.

   In the upper part of the Billing overview page, you can view the numbers of billing plans, policies, and rules that are available and in use in the **Billing plan**, **Billing Policy**, and **Billing rules** sections.
4. In the lower part of the page, the effective time of billing plans and policies is displayed in a Gantt chart. You can select an option from the drop-down list in the upper-right corner to change the time span of the chart.
5. You can slide the Gantt chart left and right to view whether billing plans and policies are effective within different periods of time. Click **LocateDay** in the upper-right corner of the page to reset the time to the current day.

1.1.10.4.2. Billable items

1.1.10.4.2.1. Create a billable item

Billable items define the billing methods of services. This topic describes how to create a billable item.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Rules**.
4. Click the billing rule to which you want to add a billable item.

5. On the **Billing rule details** page, click **Create a billing item**.
6. In the **Create a billing item** panel, set the following parameters.

Parameter	Required	Description
Billing item name	Yes	The name of the custom billable item. The name can be up to 64 characters in length and must be unique.
Billing item description	No	The description of the custom billable item. The description can be up to 256 characters in length.
Unit price information settings	Yes	The pricing logic of a specific service feature within a unit quantity. Valid values: ○ **Fixed pricing**: You are charged for each instance on an hourly basis at a fixed rate that does not change with variables within a unit quantity. For example, the storage feature does not have properties such as specifications. You are charged at a fixed rate for each GB of stored data. This pricing logic is fixed pricing. ○ **Pricing**: Service prices change with properties such as specifications. Prices vary based on types or property values. For example, Elastic Compute Service (ECS) provides a variety of instance types at different prices. Metering fields and values can be found in the metering data. The system obtains the values of specific metering fields from the metering data to determine the unit price of an instance. Additionally, the prices of some services are not entirely determined by specifications. For example, the prices of resources with identical specifications may vary based on their region. In metering pricing mode, prices are determined by a combination of **Primary pricing** and **From pricing**, which is similar to MySQL composite indexes. After you set **Primary pricing** and **From pricing**, you can click **Download pricing file**. Then, you can edit the billable items and prices in the file and click **Upload pricing file** to upload the file again. **Note** A maximum of two fields can be combined to determine prices.

Parameter	Required	Description
Quantity information settings	Yes	The quantity of resources used in a service within 1 hour. Valid values: ○ **Fixed quantity**: The number of instances is fixed in each metering data record. For example, you are charged for an ECS instance based on its instance type. Each metering data record represents an instance. Then, the quantity is 1. ○ **Metering quantity**: The number of instances is defined in each metering data record. A field in the metering data must be used to specify the quantity. During billing, the system obtains the value of this field in the metering data and calculates fees. For example, for Object Storage Service (OSS), the value of the Storage field in the metering data indicates the amount of used storage space. If you are charged for the amount of used storage space, the Storage field must be specified to define the quantity property. Conversion factor: The unit used to measure metering data may not be the same as that used to determine the price. For example, the storage price is calculated based on the amount of GBs consumed in OSS. In the metering data, the unit of the Storage value may be byte. Therefore, a conversion factor must be declared in the definition of each quantity. You can divide a quantity in the metering data by a conversion factor to convert the original unit to the unit in a price.
Billing unit	Yes	The unit of the custom billable item. Example: USD/hour.

7. Click **Determine**.

1.1.10.4.2.2. Clone a billable item

You can clone an existing billable item to create the same or a similar billable item.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Rules**.
4. Click the name of the billing rule that you want to manage.
5. In the **Billing item** section, find the billable item that you want to clone and click **Clone** in the **Operation** column.
6. In the **Create a billing item** panel, modify parameters of the billable item.

   For more information about billable item parameters, see Create a billable item.
7. Click **Determine**.

1.1.10.4.2.3. Modify a billable item

This topic describes how to modify a billable item.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Rules**.
4. Click the name of the billing rule that you want to manage.
5. In the **Billing item** section, find the billable item that you want to modify and click **Editing** in the **Operation** column.
6. In the **Modify billing items** panel, modify parameters of the billable item.
7. Click **Determine**.

> **Warning**
>
> If you modify billing items that are in use, billing data may change. This change cannot be undone. Proceed with caution.

1.1.10.4.2.4. Delete a billable item

You can delete billable items that are incorrect or no longer needed.

Prerequisites

At least one billable item is retained in a billing rule.

> **Warning**
>
> If you delete billable items, billing data may change. This change cannot be undone. Proceed with caution.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Rules**.
4. Click the name of the billing rule that you want to manage.
5. In the **Billing item** section, find the billable item that you want to delete and click **Delete** in the **Operation** column.

1.1.10.4.3. Billing rules

1.1.10.4.3.1. Create a billing rule

A billing rule consists of all billable items of a service. Billing rules define which billing dimensions are used for services. This topic describes how to create a billing rule for a cloud service.

Background information

Service fees are accumulated from multiple billable items. A billing rule must contain at least one billable item. The number of billable items of a cloud service is unlimited. However, we recommend that you do not configure large numbers of billable items.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.

2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings Management** > **Billing Rules**.
4. Click **Create billing rules**.
5. In the **Create billing rules** panel, set the following parameters.

Parameter	Required	Description
Rule name	Yes	The name of the custom billing rule. The name can be up to 64 characters in length and must be unique.
Rule description	No	The description of the custom billing rule. The description can be up to 256 characters in length.
Associated cloud products	Yes	The associated cloud service that you want to manage.
Select billing item	Yes	After you select an associated cloud service, you can select billable items. A maximum of three billable items can be selected. If no appropriate billable item is available, you can click Create billing items to create billable items based on actual requirements. For more information, see Create a billable item.

6. Click **Determine**.

1.1.10.4.3.2. View billing rules

This topic describes how to view existing billing rules and their details.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings Management** > **Billing Rules**.
4. (Optional) Use the following methods to filter billing rules:
   - Select a cloud service associated with billing rules from the service drop-down list and click **Search** to view all billing rules of the cloud service.
   - Select **All statuses**, **Not used**, **In use**, or **Used** from the status drop-down list and click **Search** to view all billing rules in the corresponding state.
   - Enter a billing rule name in the search box and click **Search** to search for the billing rule. Fuzzy search is supported.

> **Note**
>
> These filter methods can be used individually or in combination to more easily view and classify existing billing rules.

5. On the Billing rules page, view **Rule NAME/Status**, **Associated cloud products**, **Rule description**, **Number of associated policies**, **Included billing items**, and **Fee**.
6. Click the name of the billing rule that you want to view.

   On the billing rule details page, you can view **Billing Policy**, **Billing field**, and **Billing item** of the billing rule.
7. Click the + icon to the left of the billable item name.

   You can view **status**, **Unit Price type**, **Metering field**, **Pricing**, **Bill presentation**, **Quantity type**, **Quantity value**, and **Conversion factor** of the billable item.

1.1.10.4.3.3. Clone a billing rule

You can clone an existing billing rule to create the same or a similar billing policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings Management** > **Billing Rules**.
4. Find the billing rule that you want to clone and click **Clone** in the **Operation** column.
5. In the **Create billing rules** panel, modify billing rule parameters based on your requirements.

   For more information about billing rule parameters, see Create a billing rule.
6. Click **Determine**.

1.1.10.4.3.4. Modify a billing rule

This topic describes how to modify a billing rule.

Prerequisites

After a billing rule is created, you cannot delete billable items that are in effect from the billing rule. You can create billable items in the billing rule, but these newly created billable items do not take effect. To modify billable items that are in effect in a billing rule, you must clone the billing rule. For more information, see Clone a billing rule.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings Management** > **Billing Rules**.
4. Click the name of the billing rule that you want to modify.
5. Modify the basic information of the billing rule.
   i. In the **Basic information** section, click **Editing**.

      You can modify **Rule name** and **Rule description**.

   ii. Click **Save**.
6. Modify the billable items of the billing rule.
   i. In the **Billing item** section, find the billable item that you want to modify and click **Editing** in the **Operation** column.

   ii. In the **Modify billing items** panel, modify related parameters and click **Determine**.

      For more information about billable item parameters, see Create a billable item.

> **Warning**
>
> If you modify billing rules that are in use, billing data may change. This change cannot be undone. Proceed with caution.

1.1.10.4.3.5. Delete a billing rule

You can delete billing rules that are incorrect or no longer needed.

Prerequisites

A billing rule is preconfigured for each service. This rule is used as the default billing rule and cannot be deleted. Default billable items in the default billing rule cannot be deleted. You can create other billable items.

> **Warning**
>
> If you delete a billing rule, billing data may change. This change cannot be undone. Proceed with caution.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings Management** > **Billing Rules**.
4. Find the billing rule that you want to delete and click **Delete** in the **Operation** column.
5. In the **Do you want to delete this rule** message, click **Delete**.

1.1.10.4.4. Billing policies

1.1.10.4.4.1. View billing policies

This topic describes how to view existing billing policies.

Background information

A billing policy consists of billing rules of multiple cloud services. A billing policy defines billing rules for a group of services, including organizations for which the billing policy is in effect and discounts for all services.
A billing policy includes a billing rule for each service, a list of organizations for which the billing policy is in effect, and a discount for each service. The discount for each service can be different.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Policies**.
4. (Optional) Use one of the following methods to filter billing policies:
   - Select **All statuses**, **Not used**, **In use**, or **Used** from the status drop-down list and click **Search** to view all billing policies in the corresponding state.
   - Enter a billing policy name in the search box and click **Search** to search for the billing policy. Fuzzy search is supported.

> **Note**
>
> These filtering methods can be used individually or in combination to more easily view and classify existing billing policies.

5. On the Billing Policy page, view **Policy name/Status**, **Include rules**, **Association plan**, and **Associated organizations**.
   - Move the pointer over the number of rules in the **Include rules** column to view the list of rule names. You can click a rule name to view its details.
   - Move the pointer over the number of plans in the **Association plan** column to view the list of plan names. You can click a plan name to view its details.
6. Click the name of the billing policy that you want to view.

   On the **Billing Policy details** page, you can view **Basic Information** and **Billing rules** of the billing policy.
7. In the **Billing rules** section, billing rules included in the billing policy are displayed as a table.

   Filter and search for billing rules by **rule status**, **product name**, and **rule name**.
8. Click icons in the upper-right corner of the **Billing rules** section to customize how the **Billing rules** section is displayed.

Icon	Description
	Shows the list in full screen mode. You can click the icon in the upper-right corner to exit the full screen mode.
	Selects the size of cells and fonts in the list. Valid values: ○ Default ○ Compact
	Selects or clears check boxes to determine the items to be displayed in the list. You can also click **Reset** to restore the list to its original settings.

1.1.10.4.4.2. Create a billing policy

This topic describes how to create a billing policy.

Background information

The system requires that each billing policy includes all services for which billing is enabled. If a service in a billing policy is provided free of charge, the discount rate can be set to 0. This discount property takes effect only in the billing policy and does not belong to billing rules.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Policies**.
4. Click **Create a billing policy**.

5. In the **Create a billing policy** panel, set the following parameters.

Parameter	Description
Policy name	The name of the custom billing policy. The name can be up to 64 characters in length and must be unique.
Note	The description of the custom billing policy. The description can be up to 256 characters in length.
Policy effective range	The level-1 organization for which the custom billing policy takes effect. You can select **All organizations take effect** to assign the billing policy to all level-1 organizations. If a metering data record belongs to an organization or a subordinate organization in the organization list to which a billing policy is assigned, the billing policy is the only one that is applicable to the metering data record.
Bind billing rules	You can perform the following operations to select a billing rule: i. Click a service name. ii. Select the billing rule that you want to use on the right. iii. In the **Set discount rate** column, enter a discount rate. If this service is provided free of charge, set the discount rate to 0. The discount rate cannot exceed 10. The default discount rate is set to 1 for all services, which indicates no discount. After fees of metering data of a service are calculated based on billing rules, the fees are multiplied by the discount rate of the service in the billing policy to calculate the price, discount, and original price. The original price is the sum of the price and the discount.

6. Click **Determine**.

1.1.10.4.4.3. Clone a billing policy

You can clone an existing billing policy to create the same or a similar billing policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Policies**.
4. Find the billing policy that you want to clone and click **Clone** in the **Operation** column.
5. In the **Create a billing policy** panel, modify the configurations of the billing policy based on your requirements.

   For information about billing policy parameters, see Create a billing policy.
6. Click **Determine**.

1.1.10.4.4.4. Modify a billing policy

This topic describes how to modify a billing policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Policies**.
4. Click the name of the billing policy that you want to modify.
5. Modify the basic information of the billing policy.
   i. In the **Basic information** section, click **Editing**.
   Policy name, **Associated organizations**, and **Note** can be modified.
   ii. Click **Save**.
6. Modify the billing rules and discount rates for each service.
   i. In the **Billing rules** section, click **Editing**.
   ii. Separately modify the billing rules and discount rates.
   - Select the desired billing rule in the **Rule name** column corresponding to the service that you want to manage.
   - Enter the expected discount rate in the **Discount rate** column corresponding to the service that you want to manage.

   iii. Click **Save**.

> **Warning**
> If you modify billing rules that are in use, billing data may change. This change cannot be undone. Proceed with caution.

1.1.10.4.4.5. Delete a billing policy

You can delete billing policies that are incorrect or no longer needed.

Prerequisites

A billing policy is preconfigured in the system. This policy is used as the default billing policy and cannot be deleted.

> **Warning**
> If you delete a billing policy, billing data may change. This change cannot be undone. Proceed with caution.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Policies**.
4. Find the billing policy that you want to delete and click **Delete** in the **Operation** column.
5. In the **Do you want to delete the policy** message, click **Delete**.

1.1.10.4.5. Billing plans

1.1.10.4.5.1. View billing plans

This topic describes how to view existing billing plans.

Background information

A billing plan consists of multiple billing policies that are configured with an effective time and priorities.
A billing plan specifies a time range for billing policies. This enables the billing system to use different billing policies at different periods of time.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Plans**.
4. (Optional) Use one of the following methods to filter billing plans:
   - Select **All statuses**, **Not used**, **In use**, or **Used** from the status drop-down list and click **Search** to view all billing plans in the corresponding state.
   - Set **Start Date** and **End Date** from the date picker and click **Search** to view all billing plans that are in effect within the specified period of time.

   > **Note**
   > These filtering methods can be used individually or in combination to more easily view and classify existing billing plans.
5. On the Billing plan page, view **Plan NAME/Status**, **Billing Policy**, **Billing rules**, **Priority**, and **Effective time** of a billing plan.
   - Move the pointer over the number of policies in the **Billing Policy** column to view the list of policy names. You can click a policy name to view its details.
   - Move the pointer over the number of rules in the **Billing rules** column to view the list of rule names. You can click a rule name to view its details.
   - The greater the number in the **Priority** column, the higher the priority of the plan.
6. Click the name of the billing plan that you want to view.

   On the **Billing plan details** page, you can view **Basic information** and **Billing Policy list** of the billing plan.
7. In the **Billing Policy list** section, view the billing policies contained in the billing plan.

   You can filter and search for billing policies by **status** and **policy name**.
8. Click icons in the upper-right corner of the **Billing Policy list** section to customize how the **Billing Policy list** section is displayed.

Icon	Description
	Shows the list in full screen mode. You can click the icon in the upper-right corner to exit the full screen mode.

Icon	Description
	Selects the size of cells and fonts in the list. Valid values: ○ Default ○ Compact
	Refreshes the list of billing policies.
	Selects or clears check boxes to determine the items to be displayed in the list. You can also click **Reset** to restore the list to its original settings.

1.1.10.4.5.2. Create a billing plan

This topic describes how to create a billing plan.

Prerequisites

- To simplify billing configurations and avoid unexpected charges due to excessive billing plans, a maximum of nine billing pans can be created (not including the default billing plan).
- To avoid errors caused by empty policies in a billing plan, the default billing policy is included in each billing plan. By default, the default billing policy has the lowest priority. This ensures that at least one billing policy is available after the billing plan is assigned to metering data.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Plans**.
4. Click **Create a billing plan**.
5. In the **Create a billing plan** panel, set the following parameters.

Parameter	Required	Description
Plan Name	Yes	The name of the custom billing plan. The name can be up to 64 characters in length and must be unique.
Effective time	Yes	The period of time for which the billing plan is in effect. You can select **Permanently effective**. This way, the billing plan is in effect all the time.
Plan priority	Yes	The priority of the billing plan in the billing system. The priority must be an integer greater than or equal to 0. The greater the number, the higher the priority.

Parameter	Required	Description
Plan Remarks	No	The description of the custom billing plan. The description can be up to 256 characters in length.
Bind a billing policy	Yes	You can add a billing policy and set the effective time and discount rate for each policy. Perform the following operations: i. Click **Add a billing policy**. ii. (Optional) Select a state from the **All statuses** drop-down list and click **Search**. iii. Select the billing policies that you want to add. iv. Click **Determine**. v. Set **Policy Effective Time** and **Discount rate** for each billing policy. The discount rate must be greater than 0 and less than or equal to 10.

6. Click **Determine**.

> **Note**
> Each billing policy in a billing plan has a priority. When metering data is matched to a billing plan, billing policies in the billing plan are selected based on their priorities. When a billing policy is selected, bills are generated only based on this policy.

1.1.10.4.5.3. Clone a billing plan

You can clone an existing billing plan to create the same or a similar billing plan.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Plans**.
4. Find the billing plan that you want to clone and click **Clone** in the **Operation** column.
5. In the **Create a billing plan** panel, modify billing plan parameters based on your requirements.

   For more information about billing plan parameters, see Create a billing plan.
6. Click **Determine**.

1.1.10.4.5.4. Modify a billing plan

This topic describes how to modify a billing plan.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Plans**.
4. Click the name of the billing plan that you want to modify.

5. Modify the basic information of the billing plan.
   i. In the **Basic information** section, click **Editing**.

      You can change **Plan Name**, **Effective range**, **Priority**, and **Remarks**.

   ii. Click **Save**.
6. Change **Effective time**, **Priority**, and **Discount rate** of the billing policy or delete the billing policy
   i. In the **Billing Policy list** section, click **Editing**.
   ii. Separately change the effective time, priority, and discount rate of a billing policy or delete the billing policy.
      - Select a new effective time from the date picker in the **Effective time** column.

        > **Note**
        > The effective time of the default billing policy cannot be changed.

      - Enter a desired discount rate in the **Discount rate** column corresponding to the billing policy.
      - Drag and drop the icon corresponding to the billing policy to prioritize it. The closer to the top of the list, the higher the priority.
      - Click **Delete** in the **Operation** column. In the **Do you want to delete the policy?** message, click Delete.

        > **Note**
        > The default billing policy cannot be deleted.

   iii. Click **Save**.
7. Add a billing policy.
   i. Click **Add a billing policy**.
   ii. (Optional) Select a state from the **All statuses** drop-down list and click **Search**.
   iii. Select the billing policies that you want to add.
   iv. Click **Determine**.
   v. Set **Effective time** and **Discount rate** for each billing policy.

> **Warning**
> If you modify billing plans that are in use, billing data may change. This change cannot be undone. Proceed with caution.

1.1.10.4.5.5. Delete a billing plan

You can delete billing plans that are incorrect or no longer needed.

Prerequisites

A billing plan is preconfigured in the system. This policy is used as the default billing policy and cannot be deleted.

> **Warning**
> If you delete a billing plan, billing data may change. This change cannot be undone. Proceed with caution.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billing Management** > **Billing Plans**.
4. Find the billing plan that you want to delete and click **Delete** in the **Operation** column.
5. In the **Do you want to delete the plan** message, click **Delete**.

1.1.10.4.6. Bills

1.1.10.4.6.1. View cloud service bills

You can view bills by cloud service type.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings** > **Cloud Service Bills**.
4. View the bill overview.
   i. Click the **Bill overview** tab.
   ii. Select the year and the month for which you want to view bills from the **Account period** date picker. You can view different data in the following sections:
   - **Cloud products bill summary**: View the number of cloud services that has billing enabled, the number of cloud services that incur charges, the total fees generated within the selected month, and the total fees generated within the selected year.
   - **Consumption trends of cloud products.Last six months**: View the consumption trend of each cloud service within the last six months. Click **Top 5** or **Top 10** in the upper-right corner to show the top five or top ten cloud services in terms of consumption within each month. Click the  or  icon to show the consumption trends of cloud services by using a column chart or a line chart.
   - **Top 10Consumption distribution of cloud products**: View the generated fees and their proportions of the top ten cloud services within the selected month.
   - **Consumption details of all cloud products**: View the fees of all cloud services within the selected month. Select Sort by fee from high to low or Sort by fee from low to high in the upper-right corner to sort cloud services by fees.
5. View bill statistics.
   i. Click the **Bill statistics** tab.
   ii. Select the year and the month for which you want to view bills from the date picker.
   iii. (Optional) Select the cloud service and the region that you want to view.

iv. Click **Search**.

You can view the billing information that meets the search conditions. The billing information includes the billing period, cloud service, region, fees, and billing cycle.

v. (Optional) Click the icon to modify fees as an operations administrator.

vi. (Optional) Click **View details** in the Operation column to view bill details.

vii. Save the queried data to your computer.

- Click **Export all bills** to save all queried data to your computer as an XLS file.
- Select the bills that you want to export and click **Export Selected bills** to save the selected data to your computer as an XLS file.

6. View bill details.

i. Click the **Bill details** tab.

ii. Select the year and the month for which you want to view bills from the **Account period** date picker.

iii. (Optional) Set Cloud products, Area, and Instance ID.

iv. Click **Search**.

You can view the billing information that meets the search conditions. The billing information includes **Account period**, **Cloud products**, **Tissue**, **Resource set**, **Instance ID**, **Area**, **Billing cycle**, **Free amount**, and **Amount payable**.

v. Save the queried data to your computer.

- Click **Export all bills** to save all queried data to your computer as an XLS file.
- Select the bills that you want to export and click **Export Selected bills** to save the selected data to your computer.

1.1.10.4.6.2. View organization and resource set bills

You can view bills by organization and resource set.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Operations**.
3. In the left-side navigation pane, choose **Billings** > **Organizations and Resource Set Bills**.
4. View the bill overview.

i. Click the **Bill overview** tab.

ii. Select the year and the month for which you want to view bills from the **Account period** date picker. You can view different data in the following sections:

- **root(and all subordinate organizations) Bill overview**: View the number of organizations, the number of organizations that incur charges, the total fees generated within the selected month, and the total fees generated within the selected year.
- **Organizational consumption trend.Last 6 months**: View the consumption trend of each organization within the last six months. Click **Top 5** or **Top 10** in the upper-right corner to show the top five or top ten organizations in terms of consumption within each month. Click the  or  icon to show the consumption trends of organizations by using a column chart or a line chart.
- **TOP 10 Resource set consumption distribution**: View the generated fees and their proportions of the top ten organizations within the selected month.
- **Organization consumption details**: View the fees of all organizations within the selected month. Select Sort by fee from high to low or Sort by fee from low to high in the upper-right corner to sort organizations by fees.

5. View bill statistics.
   i. Click the **Bill statistics** tab.
   ii. Select the year and the month for which you want to view bills from the date picker.
   iii. (Optional) Select the organization and the resource set that you want to view.
   iv. Click **Search**.

   You can view the billing information that meets the search conditions. The billing information includes **Account period**, **Organization name**, **Resource set name**, **Amount**, and **Billing cycle**.

   v. (Optional) Click the icon to modify fees as an operations administrator.
   vi. (Optional) Click **View details** in the Operation column to view bill details.
   vii. Save the queried data to your computer.
   - Click **Export all bills** to save all queried data to your computer as an XLS file.
   - Select the bills that you want to export and click **Export Selected bills** to save the selected data to your computer as an XLS file.
6. View bill details.
   i. Click the **Bill details** tab.
   ii. Select the year and the month for which you want to view bills from the **Account period** date picker.
   iii. (Optional) Set **Organization and resource set**, **Cloud products**, **Area**, and Instance ID.
   iv. Click **Search**.

   You can view the billing information that meets the search conditions. The billing information includes **Account period**, **Cloud products**, **Tissue**, **Resource set**, **Instance ID**, **Area**, **Billing cycle**, **Free amount**, and **Amount payable**.

   v. Save the queried data to your computer.
   - Click **Export all bills** to save all queried data to your computer as an XLS file.
   - Select the bills that you want to export and click **Export Selected bills** to save the selected data to your computer as an XLS file.

1.1.11. Security

1.1.11.1. View operation logs

You can view operation logs to obtain up-to-date information for a variety of resources and functional modules in the Apsara Uni-manager Management Console. You can also export operation logs to your computer.

Procedure

1. Log on to the Apsara Uni-manager Management Console as a security administrator.
2. In the top navigation bar, click **Security**.
3. Select an **organization and a resource set**, a **resource type**, and a **product** and then click **Search**.

   You can also click **Advanced** in the upper-right corner to obtain more filter conditions, such as **User name**, **Resource ID**, **Source IP address**, **Start Date**, **End Date**, and **Keyword search**.

   The following table describes the fields in the query result.

   Fields in the query result

Log field	Description
Tissue	The organization of the object on which operations are performed.
Resource set	The resource set of the object on which operations are performed.
Resource type	The resource type of the object on which operations are performed.
Resource id	The ID of the object on which operations are performed.
State	The current status of the operation.
User	The name of the operator.
Event type	The operation performed on an Apsara Stack service. Operations include create, modify, delete, query, update, bind, unbind, enable or disable service instances, apply for or release service instances, or change ownership of service instances.
Source IP address	The IP address of the operator.
Details	A brief introduction of the operation.
Time	The start and end time of the operation.

   Note You can click the icon and select the fields that you want to show in the query result from the drop-down list.

4. (Optional)Click the icon to save the logs displayed on the current page to your computer as a CSV file.

1.1.12. RAM

1.1.12.1. RAM introduction

Resource Access Management (RAM) is a resource access control service provided by Apsara Stack.

You can use RAM to manage users and control which resources are accessible to employees, systems, and applications.

RAM provides the following features:

- RAM role

  To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a RAM role. This role specifies the operations that the cloud service can perform on resources.

  Only system administrators and level-1 organization administrators can create RAM roles.

- User group

  You can create multiple users within an organization and grant them different operation permissions on cloud resources.

  You can create RAM user groups to classify and authorize RAM users within your Apsara Stack tenant account. This simplifies the management of RAM users and their permissions.

  You can create RAM permission policies to grant different operation permissions to different user groups.

1.1.12.2. Permission policy structure and syntax

This topic describes the structure and syntax used to create or update permission policies in Resource Access Management (RAM).

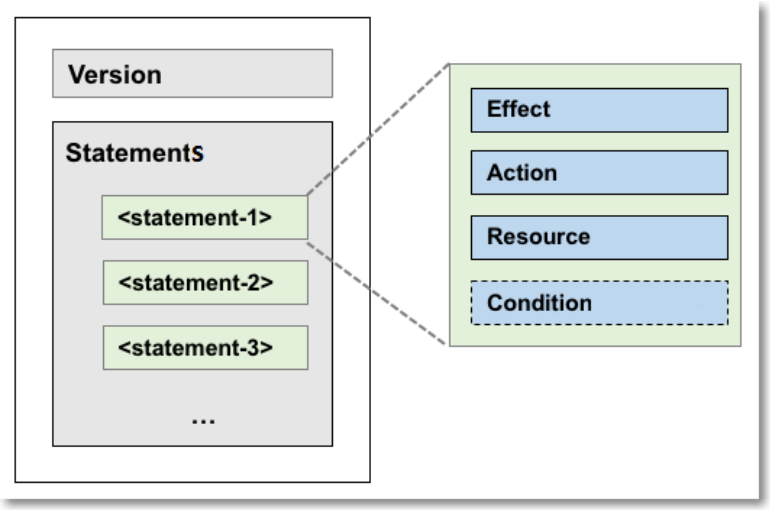
Policy characters and usage rules

- Characters in a policy
  - The following characters are JSON tokens and are included in policies: `{ } [ ] " , :`.
  - The following characters are special characters in the syntax and are not included in policies: `= < > ( ) |`.
- Use of characters
  - If an element can have more than one value, you can perform the following operations:
    - Separate multiple values by using commas (,) as delimiters between each value and use an ellipsis (...) to describe the remaining values. Example: `[ <action_string>, <action_string>, ...]`.
    - Include only one value. Examples: `"Action": [<action_string>]` and `"Action": <action_string>`.
  - A question mark (?) following an element indicates that the element is optional. Example: `<condition_block?>`.
  - A vertical bar (`|`) between elements indicates multiple options. Example: `("Allow" | "Deny")`.
  - Elements that must be text strings are enclosed in double quotation marks (""). Example: `<version_block> = "Version" : ("1")`.

Policy structure

The policy structure includes the following components:

- The version number.
- A list of statements. Each statement contains the following elements: Effect, Action, Resource, and Condition. The Condition element is optional.



Policy syntax

```
policy  = {
     <version_block>,
     <statement_block>
}
<version_block> = "Version" : ("1")
<statement_block> = "Statement" : [ <statement>, <statement>, ... ]
<statement> = {
    <effect_block>,
    <action_block>,
    <resource_block>,
    <condition_block? >
}
<effect_block> = "Effect" : ("Allow" | "Deny")
<action_block> = ("Action" | "NotAction") :
    ("*" | [<action_string>, <action_string>, ...])
<resource_block> = ("Resource" | "NotResource") :
    ("*" | [<resource_string>, <resource_string>, ...])
<condition_block> = "Condition" : <condition_map>
<condition_map> = {
  <condition_type_string> : {
      <condition_key_string> : <condition_value_list>,
      <condition_key_string> : <condition_value_list>,
      ...
  },
  <condition_type_string> : {
      <condition_key_string> : <condition_value_list>,
      <condition_key_string> : <condition_value_list>,
      ...
  }, ...
}
<condition_value_list> = [<condition_value>, <condition_value>, ...]
<condition_value> = ("String" | "Number" | "Boolean")
```

Description:

- The current policy version is 1.
- The policy can have multiple statements.

- The effect of each statement can be either `Allow` or `Deny`.

  > **Note** In a statement, both the Action and Resource elements can have multiple values.

- Each statement can have its own conditions.

  > **Note** A condition block can contain multiple conditions with different operators and logical combinations of these conditions.

- You can attach multiple policies to a RAM user. If policies that apply to a request include an `Allow` statement and a `Deny` statement, the Deny statement overrides the Allow statement.
- Element value:
  - If an element value is a number or Boolean value, it must be enclosed in double quotation marks ("") in the same way as strings.
  - If an element value is a string, characters such as the asterisk (`*`) and question mark (`?`) can be used for fuzzy matching.
    - The asterisk (`*`) indicates any number (including zero) of allowed characters. For example, `ecs:Describe*` indicates all ECS API operations that start with `Describe`.
    - `The question mark (?)` indicates an allowed character.

Policy format check

Policies are stored in RAM as JSON documents. When you create or update a policy, RAM first checks whether the JSON format is valid.

- For more information about JSON syntax standards, see RFC 7159.
- We recommend that you use tools such as JSON validators and editors to check whether the policies meet JSON syntax standards.

1.1.12.3. RAM roles

1.1.12.3.1. View basic information of a RAM role

You can view basic information of a RAM role, including its user groups and existing permission policies.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Click the name of the RAM role that you want to view.
5. On the **Role Authorization** page, click the **User Groups** and **Permissions** tabs to view related information.

1.1.12.3.2. Create a RAM role

To authorize a cloud service in a level-1 organization to use other resources in the organization, you must create a Resource Access Management (RAM) role. This role contains the operations that the cloud service can perform on resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.

3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Click **Create RAM Role** in the upper-left corner.
5. On the **Create a RAM role** page, set **Role name**, **Description**, and **Sharing Scope**.

   Valid values of the **Sharing Scope** parameter:

   - **Global**

     The role is visible and valid to all organizations involved. The default value is Global.
   - **Current Organization**

     The role is visible and valid to the organization to which the user belongs.
   - **Subordinate Organization**

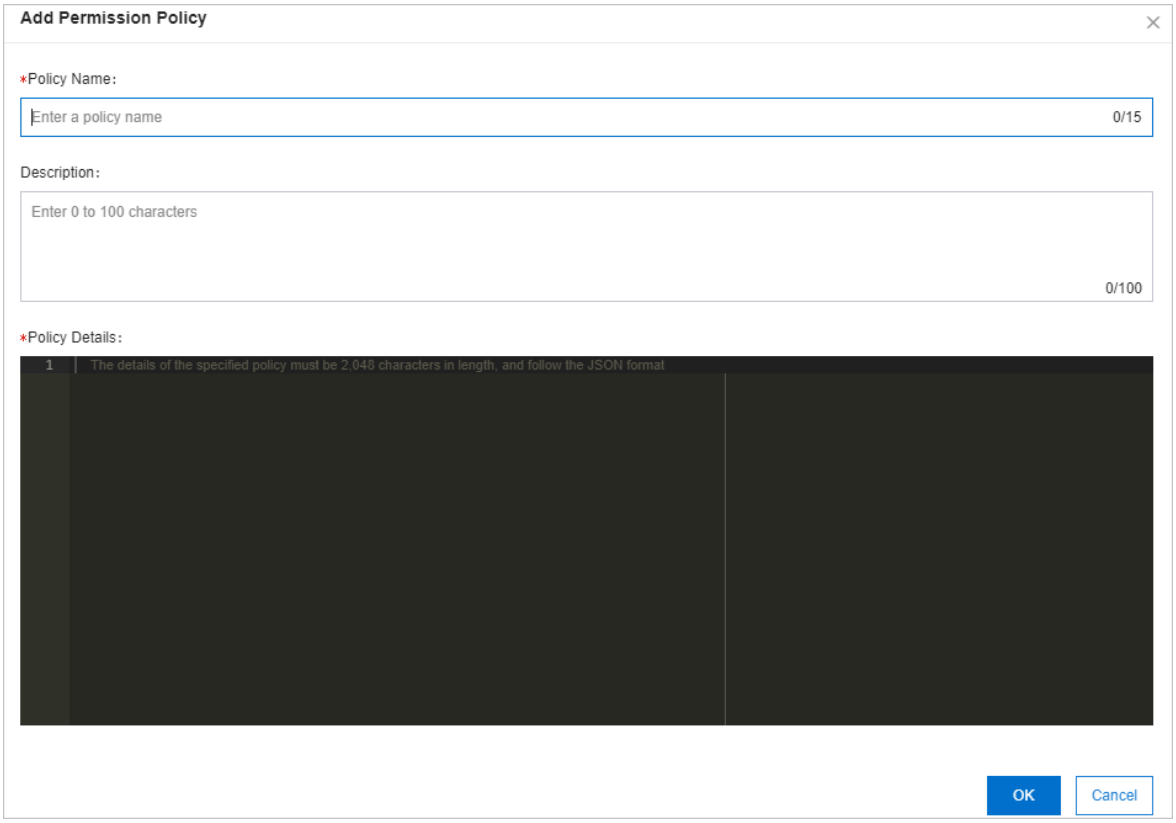
     The role is visible and valid to the organization to which the user belongs and its subordinate organizations.
6. Click **Create and configure a RAM role**.

1.1.12.3.3. Create a policy

To use a cloud service to access other cloud resources, you must create a policy and attach it to a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the Resource Access Management (RAM) role that you want to modify and click **Modify** in the **Actions** column.
5. Click the **Permissions** tab.
6. Click **Add Permission Policy**.
7. In the Add Permission Policy dialog box, enter information of the policy.



For more information about how to enter the policy content, see Permission policy structure and syntax.

8. Click **OK**.

1.1.12.3.4. Modify the content of a RAM policy

You can modify the content of a Resource Access Management (RAM) policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role that you want to modify and click **Modify** in the **Actions** column.
5. Click the **Permissions** tab.
6. Click the name of a policy in the **Permission Policy Name** column.
7. In the **Modify Permission Policy** dialog box, modify the relevant information and click **OK**.

   For more information about how to modify the policy content, see Permission policy structure and syntax.

1.1.12.3.5. Modify the name of a RAM policy

You can modify the name of a Resource Access Management (RAM) policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.

4. Find the RAM role that you want to modify and click **Modify** in the **Actions** column.
5. Click the **Permissions** tab.
6. Click the name of a policy in the **Permission Policy Name** column.
7. In the **Modify Permission Policy** dialog box, modify the policy name.

1.1.12.3.6. Add a RAM role to a user group

You can bind Resource Access Management (RAM) roles to user groups.

Prerequisites

A user group is created. For more information, see Create a user group.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role that you want to manage and click **Modify** in the **Actions** column.
5. Click the **User Groups** tab.
6. Click **Add User Group**. In the Add User Group dialog box, select a user group.
7. Click **OK**.

1.1.12.3.7. Grant permissions to a RAM role

When you grant permissions to a RAM role, all users in the user groups that are assigned this role share the granted permissions.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role to which you want to grant permissions and click **Modify** in the **Actions** column.
5. Click the **Permissions** tab.
6. Click **Select Existing Permission Policy**.
7. In the dialog box that appears, select a RAM policy and click **OK**.

   If no RAM policy is available, you must add a policy. For more information, see Add a permission policy.

1.1.12.3.8. Remove permissions from a RAM role

You can remove permissions that are no longer needed from Resource Access Management (RAM) roles.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role that you want to manage and click **Modify** in the **Actions** column.
5. Click the **Permissions** tab.
6. Find the policy that you want to remove and click **Remove** in the **Actions** column.

1.1.12.3.9. Change a RAM role name

Administrators can change the names of Resource Access Management (RAM) roles.

Context

The names of preset roles cannot be changed.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role whose name you want to change and click **Modify** in the **Actions** column.
5. Enter a new role name.

1.1.12.3.10. Delete a RAM role

You can delete a Resource Access Management (RAM) role that is no longer need.

Prerequisites

No policies are attached to the RAM role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Permissions > Role Permissions**.
4. Find the RAM role that you want to delete and click **Modify** in the **Actions** column.
5. In the message that appears, click **OK**.

1.1.12.4. RAM authorization policies

1.1.12.4.1. Create a service-linked role

You can create authorization policies and grant them to organizations.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Service-linked Roles**.
4. In the upper-left corner of the page, click **Create Service-linked Role**.
5. On the **Create Service-linked Role** page, set **Organization Name** and **Service Name**.
6. Click **OK**.

1.1.12.4.2. View the details of a service-linked role

You can view the details of a Resource Access Management (RAM) role, including its role name, creation time, description, and Alibaba Cloud Resource Name (ARN).

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Service-linked Roles**.
4. On the **Service-linked Roles** page, set **Role Name**, **Service Name**, or **Organization Name**, and click **Search**.

   To perform another search, click **Reset**.
5. Find the service-linked role that you want to view and click **View Details** in the **Actions** column.

1.1.12.4.3. View RAM policies

You can view the details of a Resource Access Management (RAM) policy, including its policy name, policy type, default version, description, association time, and policy content.

Prerequisites

A RAM policy is created. For more information, see Create a RAM role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an operations administrator.
2. In the top navigation bar, click **Configurations**.
3. In the left-side navigation pane, click **Service-linked Roles**.
4. On the **Service-linked Roles** page, set **Role Name** or **Service Name** and click **Search** in the upper-right corner.

   To perform another search, click **Reset**.
5. Find the service-linked role that you want to view and click **View Details** in the **Actions** column.
6. Click the **Role Policy** tab to view the information of the role policy. Click **View Details** in the Actions column to view the policy details.

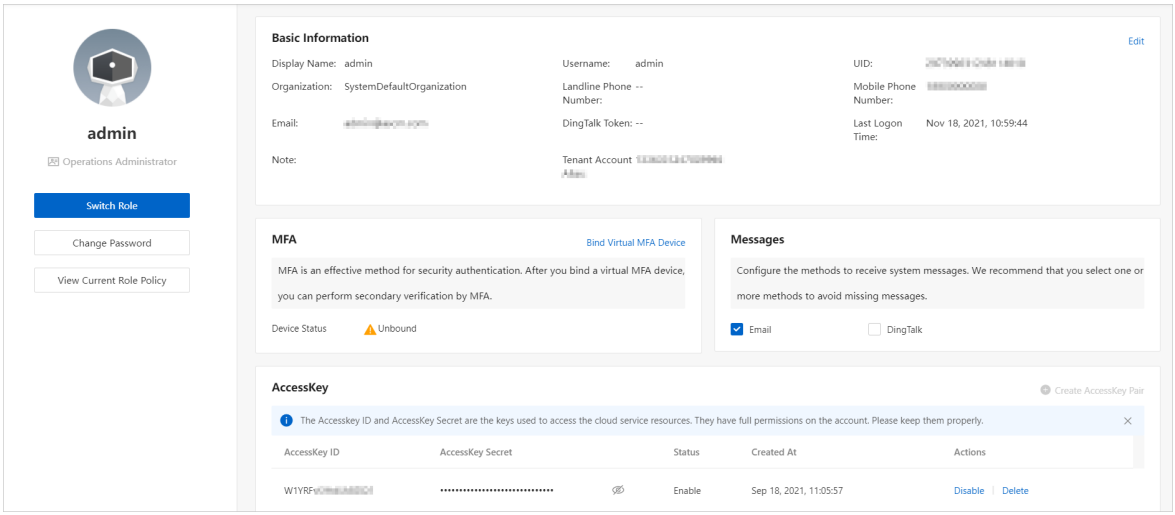
1.1.13. Personal information management

1.1.13.1. Modify personal information

You can modify your personal information to keep it up to date.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.



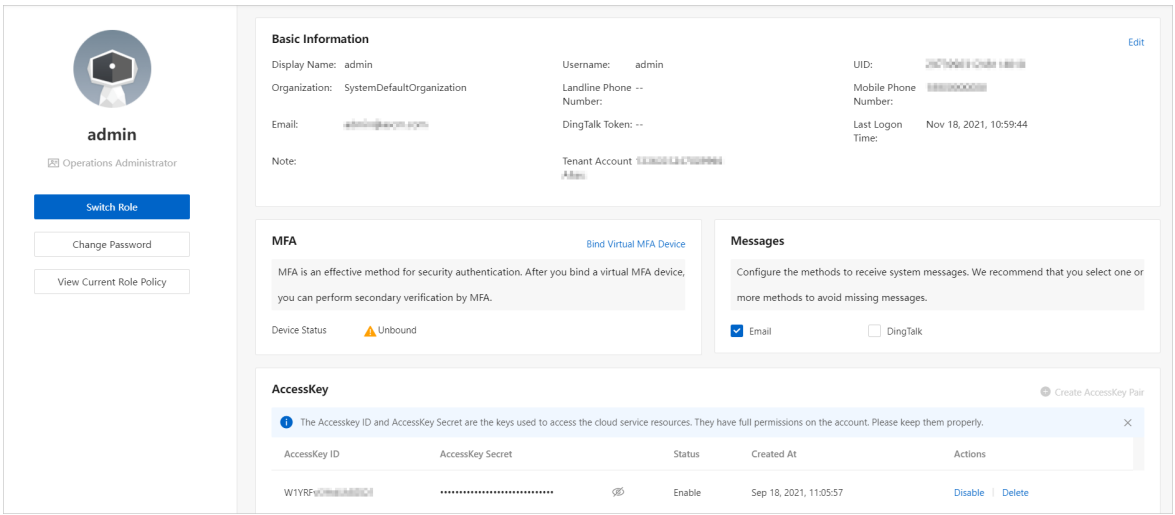
3. In the upper-right corner of the **Basic Information** section, click **Edit**.
4. In the **Modify User Information** dialog box, modify the personal information.
5. Click **OK**.

1.1.13.2. Change the logon password

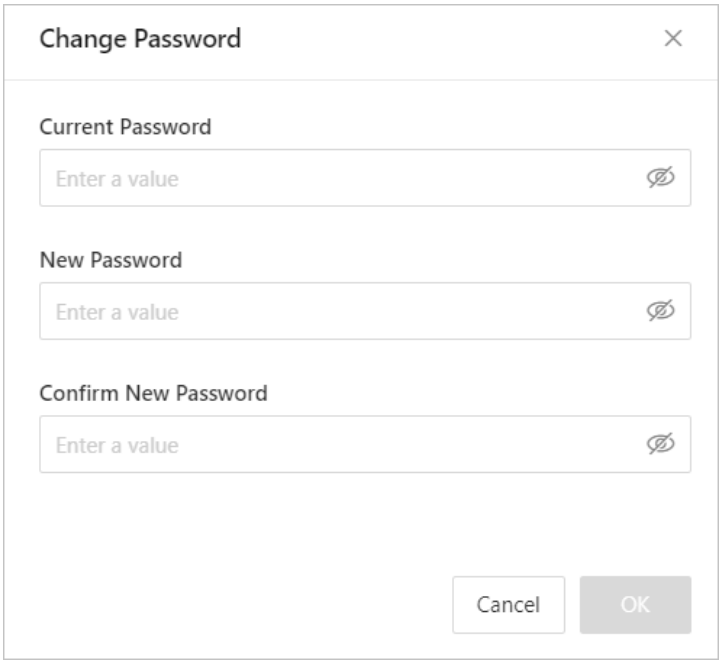
To improve security, you must change your logon password on a regular basis. This topic describes how to change your logon password.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **User Information**.



3. Click **Change Password**.
4. In the **Change Password** dialog box, set **Current Password**, **New Password**, and **Confirm Password**.



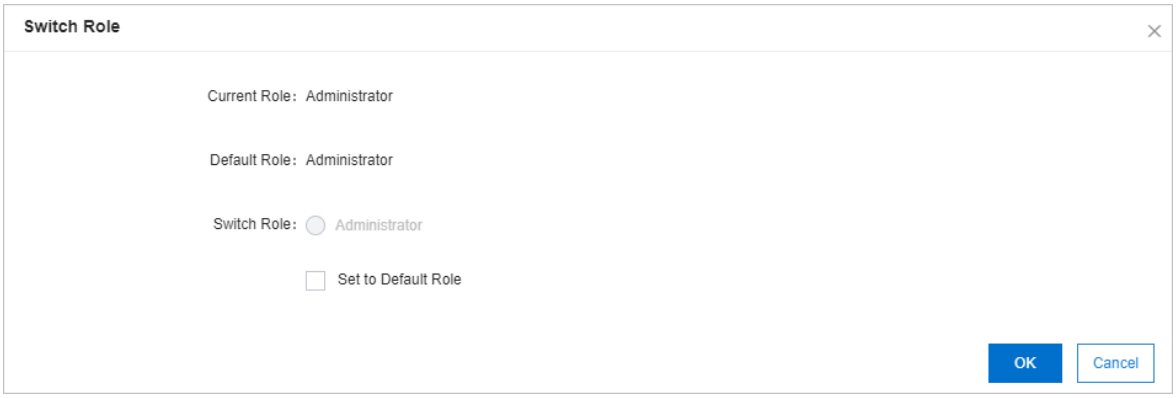
5. Click **OK**.

1.1.13.3. Switch the current role

You can switch the scope of your current role.

Procedure

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the upper-right corner of the homepage, move the pointer over the user profile picture and choose **User Information** from the shortcut menu.
3. Click **Switch Role**.
4. In the **Switch Role** dialog box that appears, select the role that you want to switch to.



You can also switch back to the default role.

1.1.13.4. View the current role policy

You can view the information of your current role policy.

Procedure

1. Log on to the Apsara Uni-manager Management Console.

2. In the upper-right corner of the homepage, move the pointer over the profile picture and click **Personal information**.
3. Click **View Current Role Policy** on the left side of the page.

   In the **View Policies of Current Role** dialog box, view your RAM role.
4. Select the organization and the policy that you want to view.

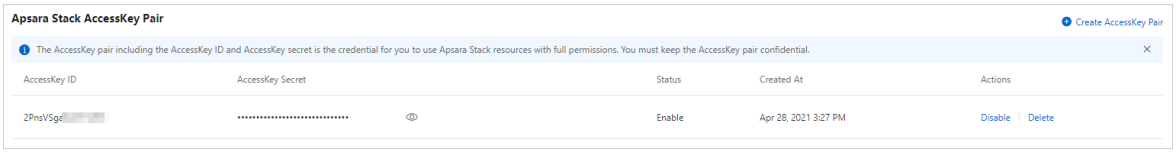
   In the **View Policies of Current Role** message, view the policy content.

1.1.13.5. View the AccessKey pair of your Apsara Stack tenant account

To ensure the security of cloud resources, the system must verify the identity of visitors and ensure that they have the relevant permissions. You must obtain the AccessKey ID and AccessKey secret of your Apsara Stack tenant to access cloud resources.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, view your AccessKey pair.



> **Note** The AccessKey pair consists of an AccessKey ID and an AccessKey secret. These credentials provide you with full permissions on Apsara Stack resources. You must keep the AccessKey pair confidential.

1.1.13.6. Create an AccessKey pair

You can delete your old AccessKey pairs and create new ones to implement the rotation of your AccessKey pairs.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the upper-right corner of the **Apsara Stack AccessKey Pair** section, click **Create AccessKey Pair**.

> **Note**
>
> Each user can have up to two AccessKey pairs.

1.1.13.7. Delete an AccessKey pair

You can delete AccessKey pairs that are no longer needed.

Prerequisites

- Each user can delete only its own AccessKey pairs. The administrator cannot delete the AccessKey pairs of users.
- Each user retains at least one AccessKey pair.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to delete and click **Delete** in the **Actions** column.
4. In the message that appears, click **OK**.

1.1.13.8. Disable an AccessKey pair

You can disable AccessKey pairs that are no longer needed. Newly created AccessKey pairs are in the Enable state by default.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to disable and click **Disable** in the **Actions** column.

   Each user can disable only its own AccessKey pairs. The administrator cannot disable the AccessKey pairs of users.
4. In the message that appears, click **OK**.

> **Note**
>
> Make sure that at least one AccessKey pair is in the Enable state.

1.1.13.9. Enable an AccessKey pair

Disabled AccessKey pairs must be re-enabled before you can continue to use them. Newly created AccessKey pairs are in the Enable state by default.

Procedure

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the **Apsara Stack AccessKey Pair** section, find the AccessKey pair that you want to enable and click **Enable** in the **Actions** column.
4. In the message that appears, click **OK**.

> **Note**
>
> Make sure that at least one AccessKey pair is in the Enable state.

1.1.13.10. MFA

1.1.13.10.1. Overview

Multi-factor authentication (MFA) is an identity authentication method in computer systems. It requires users to provide two or more verification factors to gain access to a resource. This topic introduces the principles and use scenarios of MFA.

Introduction to MFA

When MFA is enabled, you must enter your username and password (first security factor) and then a variable verification code (second security factor) from an MFA device when you log on to the Apsara Uni-manager Management Console. Two-factor authentication enhances security for your account.

MFA devices use the Time-based One-time Password (TOTP) algorithm to generate time-dependent 6-digit dynamic verification codes. The Apsara Uni-manager Management Console supports software-based virtual MFA devices. You can install software such as the Alibaba Cloud app that supports MFA on your mobile device such as your mobile phone to act as a virtual MFA device.

Limits

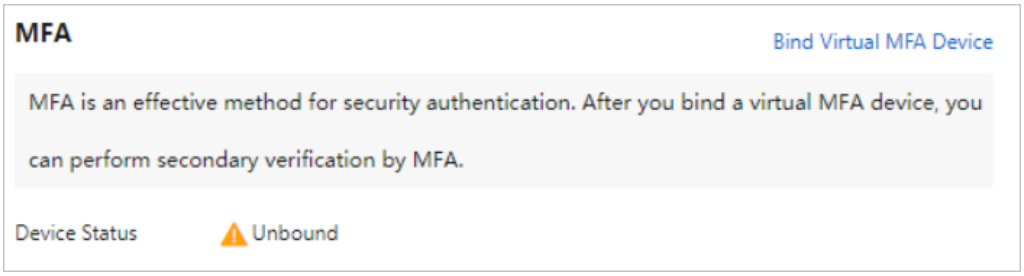
The TOTP algorithm requires that the time of the system clock of the Apsara Uni-manager Management Console remain consistent with the standard time on the Internet. Otherwise, discrepancies in time can lead to inconsistent MFA verification codes and leave you unable to log on to the Apsara Uni-manager Management Console.

1.1.13.10.2. Bind a virtual MFA device to enable MFA

Multi-factor authentication (MFA) is automatically enabled after you bind an MFA device. This topic describes how to bind a virtual MFA device.

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.
3. In the upper-right corner of the **MFA** section, click **Bind Virtual MFA Device**.
4. On the **Bind Virtual MFA Device** page, follow the instructions to bind an MFA device.

   The following figure shows the MFA section after the MFA device is bound.



Results

After a virtual MFA device is bound, you must enter a 6-digit MFA verification code in addition to your username and password before you can log on to the Apsara Uni-manager Management Console.

1.1.13.10.3. Unbind a virtual MFA device to disable MFA

To disable multi-factor authentication (MFA), you must disable the MFA device that is bound. This topic describes how to unbind a virtual MFA device to disable MFA.

1. Log on to the Apsara Uni-manager Management Console.
2. In the upper-right corner of the homepage, move the pointer over the profile picture and choose **User Information** from the shortcut menu.

3. In the upper-right corner of the **MFA** section, click **Disable Virtual MFA Device**.
4. In the dialog box that appears, click **Disable Virtual MFA Device**.

   After you disable MFA, you need only to enter your username and password the next time you log on to the Apsara Uni-manager Management Console.

1.1.13.10.4. Forcibly enable MFA

Administrators including the platform administrator, operations administrator, and organization administrator can check whether their users have multi-factor authentication (MFA) enabled. If MFA is disabled for the users, the administrators can forcibly enable MFA for the users.

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users** > **Users**.
4. Click the **System Users** tab.
5. Find the user for whom you want to forcibly enable MFA and choose **More** > **View MFA Status** in the **Actions** column.

   You can search for the user by username, organization, or role.
6. In the MFA Status Prompt message, click **OK**.

> **Note**
>
> - After MFA is forcibly enabled for a user, the user must go to the Bind Virtual MFA Device page to bind a virtual MFA device before the user can log on to the Apsara Uni-manager Management Console.
> - MFA can be forcibly enabled for users, but cannot be forcibly disabled. Before MFA is enabled, the MFA status of the user is **Not Enabled**.
> - After MFA is enabled, the MFA status of the user is **Enabled but Not Bound**.

1.1.13.10.5. Reset MFA

If you lose your multi-factor authentication (MFA) key, you must have the administrator reset the key. The MFA key is automatically reset while the password is reset.

1. Log on to the Apsara Uni-manager Management Console as an administrator.
2. In the top navigation bar, click **Enterprise**.
3. In the left-side navigation pane, choose **Users** > **Users**.
4. Click the **System Users** tab.
5. Find the user for whom you want to reset MFA and click the username.

   You can search for the user by username, organization, or role.
6. In the user details panel, click **Reset password**.

2.Elastic Compute Service (ECS)

2.1. User Guide

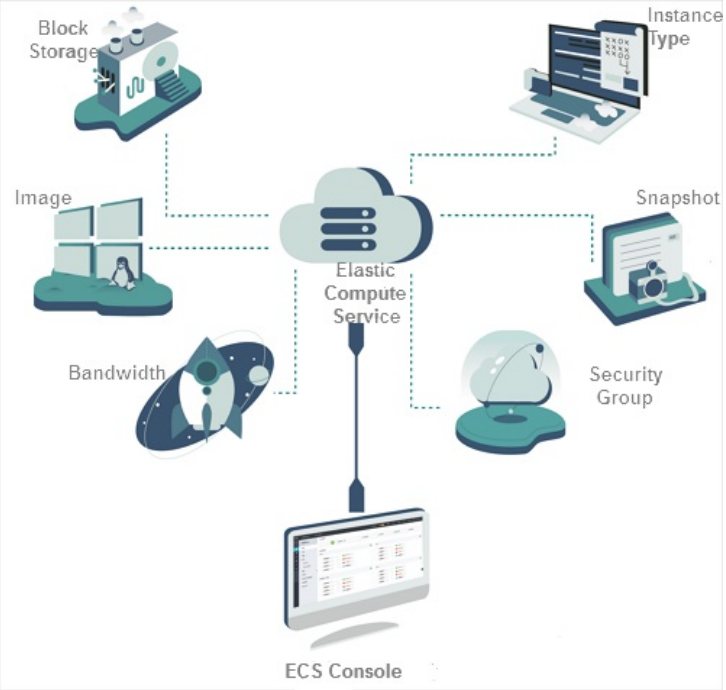
2.1.1. What is ECS?

2.1.1.1. Overview

Elastic Compute Service (ECS) is a type of computing service that features elastic processingcapabilities. Compared with physical servers, ECS can be more efficientlymanaged and is more user-friendly. You can create instances, resize disks, and add or release any number of ECS instances at any time based on your business needs.

An ECS instance is a virtual computing environment that contains the most basic components of computers such as the CPU, memory, and storage. Users perform operations on ECS instances. Instances are core components of ECS, and operations can be performed on instances by using the ECS console. Other resources such as block storage, images, and snapshots can only be used after they are integrated into ECS instances. For more information, see ECS components.

ECS components



2.1.1.2. Instance lifecycle

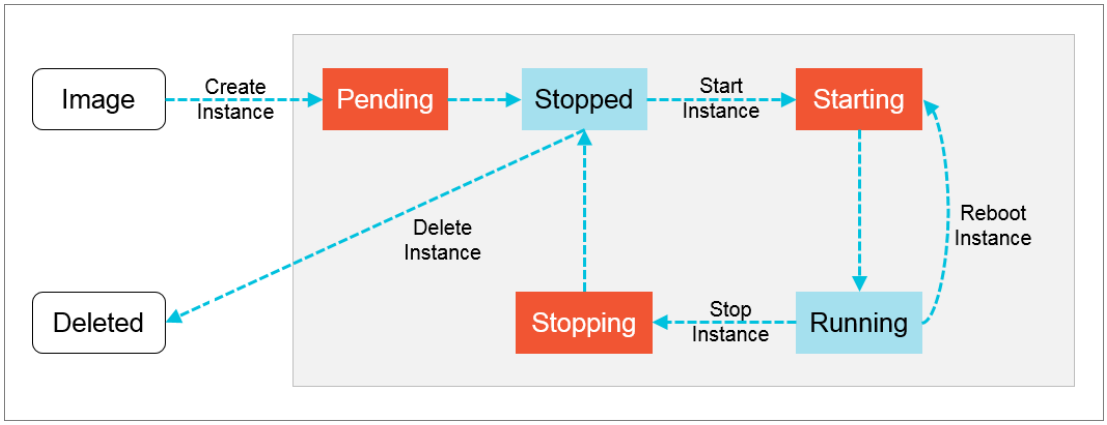
The lifecycle of an ECS instance begins when the instance is created and ends when the instance is released. This topic describes the instance states in the ECS console as well as state attributes and their corresponding instance states in API responses.

The following table describes the instance states in the ECS console and their corresponding instance states in API responses.

State	State attribute	Description	State in an API response

State	State attribute	Description	State in an API response
Instance being created	Intermediate	The instance is being created and waiting to start. If an instance remains in this state for an extended period of time, an exception has occurred.	Pending
Starting	Intermediate	When you start or restart an instance by using the ECS console or by calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Starting state for an extended period of time, an exception has occurred.	Starting
Running	Stable	While an instance is in the Running state, the instance can function normally and can accommodate your business needs.	Running
Stopping	Intermediate	When you stop an instance by using the ECS console or by calling an API operation, the instance enters this state before it enters the Stopped state. If an instance remains in the Stopping state for an extended period of time, an exception has occurred.	Stopping
Stopped	Stable	An instance enters this state when it is stopped. Instances in the Stopped state cannot provide external services.	Stopped
Reinitializing	Intermediate	When you re-initialize the system disk or a data disk of an instance by using the ECS console or calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Reinitializing state for an extended period of time, an exception has occurred.	Stopped
Changing system disk	Intermediate	When you replace the system disk of an instance by using the ECS console or by calling an API operation, the instance enters this state before it enters the Running state. If an instance remains in the Changing system disk state for an extended period of time, an exception has occurred.	Stopped

The following figure shows the transitions between instance states in API responses.



2.1.2. Instructions

2.1.2.1. Restrictions

Learn about restrictions before performing operations on ECS instances.

- Do not upgrade the kernel or operating system version of an ECS instance.
- Do not start SELinux for Linux systems except CentOS and RedHat.
- Do not detach PVDriver.
- Do not arbitrarily modify the MAC address of the network interface.

2.1.2.2. Suggestions

Consider the following suggestions to make more efficient use of ECS:

- ECS instances with 4 GiB or higher memory must use a 64-bit operating system. 32-bit operating systems have a maximum of 4 GiB of memory addressing.
- A 32-bit Windows operating system supports a maximum of 4 CPU cores.
- To ensure service continuity and avoid failover-induced service unavailability, we recommend that you configure service applications to boot automatically at system startup.

2.1.2.3. Limits

Before using ECS instances, you must be familiar with the limits of instance families.

General limits

- Windows operating systems support a maximum of 64 vCPUs in instance specifications.
- ECS instances do not support the installation of virtualization software and secondary virtualization.
- Sound card applications are not supported. Only GPU instances support virtual sound cards. External hardware devices, such as hardware dongles, USB flash drives, external hard disks, and bank U keys, cannot be directly connected to ECS instances.
- ECS does not support multicast protocols. If multicasting services are required, we recommend that you use unicast instead.

Instance family ga1

To create a ga1 instance, you must use one of the following images pre-installed with drivers:

- Ubuntu 16.04 with an AMD GPU driver pre-installed
- Windows Server 2016 English version with an AMD GPU driver pre-installed
- Windows Server 2008 R2 English version with an AMD GPU driver pre-installed

Note:

- A ga1 instance uses an optimized driver provided by Alibaba Cloud and AMD. The driver is installed in images provided by Alibaba Cloud and is currently unavailable for download.
- If the GPU driver malfunctions due to improper removal of related components, you need to replace the system disk to restore GPU related functions.

  > **Note** This operation causes data loss.

- If the driver malfunctions because an improper image is selected, you need to replace the system disk to reselect an image with an AMD GPU driver pre-installed.
- For Windows Server 2008 or earlier, you cannot connect to the VNC after the GPU driver takes effect. The VNC is irresponsive with a black screen or stuck at the splash screen. You can use other methods such as Remote

Desktop Protocol (RDP) to access the system.

- RDP does not support DirectX, OpenGL, or other related applications. You need to install the VNC and a client, or use other supported protocols such as PCOIP and XenDesktop HDX 3D.

Instance families gn4, gn5i, and gn5

- Bandwidth: If you use an image of Windows Server 2008 R2 for a gn4 instance, you cannot use the Connect to VNC function in the ECS console to connect to the instance after the installed GPU driver takes effect. You need to set the bandwidth to a non-zero value or attach an Elastic IP address to the created instance.
- Image: If an NVIDIA GPU driver is not required, you can select any image, and then Install the CUDA and GPU drivers for a Linux instance or Install the CUDA and GPU drivers for a Windows instance.

2.1.2.4. Notice for Windows users

Before using Windows-based ECS instances, you must consider the following points:

- Data loss may occur if a local disk is used as the data disk of an instance. We recommend that you use a cloud disk to create your instance if you are not sure about the reliability of the data architecture.
- Do not close the built-in shutdownmon.exe process. Otherwise, the server may require a longer time to restart.
- Do not rename, delete, or disable Administrator accounts or it may affect the use of the server.
- We do not recommend that you use virtual memory.
- When you modify your computer name, you must synchronize the following key values in the registry. Otherwise, the computer name cannot be modified, causing failure when installing certain third-party programs. The following key values must be modified in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\ControlSet001\Control\ComputerName\ActiveComputerName
```

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\ComputerName\ComputerName
```

2.1.2.5. Notice for Linux users

Before using Linux-based ECS instances, you must consider the following points:

- Do not modify content of the default /etc/issue files under a Linux instance. Otherwise, the custom image created from the instance cannot be recognized, and instances created based on the image cannot start as expected.
- Do not arbitrarily modify the permissions of each directory in the partition where the root directory is located, especially permissions of /etc, /sbin, /bin, /boot, /dev, /usr, and /lib directories. Improper modification of permissions can cause errors.
- Do not rename, delete, or disable Linux root accounts.
- Do not compile or perform any other operations on the Linux kernel.
- We do not recommend the use of Swap for partitioning.
- Do not enable the NetWorkManager service. This service conflicts with the internal network service of the system, causing network errors.

2.1.2.6. Notice on defense against DDoS attacks

You need to purchase Anti-DDoS Pro to defend against DDoS attacks. For more information, see *Apsara Stack Security Product Introduction*.

2.1.3. Quick start

2.1.3.1. Overview

This topic describes how to create and connect to an Elastic Compute Service (ECS) instance.

Perform the following operations:

1. Create a security group

   A security group acts as a virtual firewall to control the inbound and outbound traffic of ECS instances. Each ECS instance must belong to at least one security group. When you create an instance, you must select a security group to control network access of the instance.

2. Create an instance

   An ECS instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network settings, and disks. After a security group is created, you can select an instance type to create instances based on your business needs.

3. Connect to an instance

   Select a method to connect to an instance based on the network configurations and operating system of the instance and the operating system of your computer. After you connect to the instance, you can perform operations on it such as installing applications.

2.1.3.2. Log on to the ECS console

This topic describes how to log on to the ECS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. In the top navigation bar, choose **Products > Elastic Computing > Elastic Compute Service**.

2.1.3.3. Create a security group

Security groups are an important means for network security isolation. They implement network access control for one or more ECS instances.

Prerequisites

A virtual compute cloud (VPC) is created. For more information, see *VPC User Guide*.

Context

Security groups determine whether the instances in the same account that are deployed within the same VPC and region can communicate with each other. By default, if the instances belong to the same security group, they can communicate with each other over the internal network. If the instances belong to different security groups, you can authorize mutual access between the security groups to allow the instances to communicate with each other over the internal network.

Procedure

1.
2.
3.
4. Click **Create Security Group**.
5. Configure the parameters listed in the following table to create a security group.

Type	Parameter	Required	Description
Region	Organization	Yes	Select an organization in which to create the security group. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	Select a resource set in which to create the security group. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	Select a region in which to create the security group. Make sure that the security group and VPC belong to the same region.
	Zone	Yes	Select a zone in which to create the security group.
Basic Settings	VPC	Yes	Select a VPC in which to create the security group.
	Security Group Name	No	Enter a name for the security group. The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.
	Description	No	Enter a description for the security group. To simplify future management operations, we recommend that you provide an informational description. The description must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.1.3.4. Create an instance

An Elastic Compute Service (ECS) instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network settings, and disks.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see the "Create a VPC" and "Create a vSwitch" topics in *Apsara Stack VPC User Guide*.

- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and vSwitch are associated with IPv6 CIDR blocks. For more information, see the "Enable an IPv6 CIDR block for a VPC" and "Enable an IPv6 CIDR block for a vSwitch" topics in *Apsara Stack VPC User Guide*.
- One or more security groups are available. If no security groups are available, create one. For more information, see Create a security group.

Context

Some limits apply when you create GPU-accelerated instances. For more information, see Limits.

Procedure

1.
2.
3.
4. Click **Create Instance**.
5. Configure the parameters described in the following tables.
   i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization.
Resource Set	Yes	Select a resource set.

   ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region.
Zone	Yes	Select a zone. Zones are the physical zones with separate power supplies and networks within the same region. The internal networks of zones are connected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

iii. Configure network settings for the instance.

Parameter	Required	Description
Network Type	Yes	Select a network type. Only **VPC** is supported.
VPC	Yes	Select a VPC.
vSwitch	Yes	Select a vSwitch.
Private IP Address	No	Specify a private IPv4 address for the instance. The private IPv4 address must be within the CIDR block of the selected vSwitch. If you do not specify a private IP address, the system allocates one to the instance.
IPv6	No	Specify whether to assign an IPv6 address to the instance.

iv. Configure instance settings such as security group, instance family, and instance type and specify the number of instances that you want to create.

Parameter	Required	Description
Security Group	Yes	Select a security group.
Deployment Set	No	Select a deployment set. You can use deployment sets to disperse or aggregate the instances involved in your business.
User Data	No	In the User Data field, enter the user data to be automatically run on instance startup. ■ Windows supports batch and PowerShell scripts. Before you perform Base64 encoding of user data, make sure that the data to be encoded includes `[bat]` or `[powershell]` as the first line. ■ Linux supports shell scripts.
Quantity	Yes	Specify the number of instances that you want to create. The number must be an integer within the range of 1 to 100.
Instance Family	Yes	Select an instance family. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Information such as CPU, memory, and instance family level are displayed in the Instance Type list. Select an instance type based on your business needs. Instance types that have specific CPU and memory combinations do not support Windows Server images. For more information, see the "Limits" topic in *ECS Product Introduction*.

v. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: **Public Image**, **Custom Image**, and **Shared Custom Image**.
Public Image	Subject to the image type	Select a public image. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images. This parameter is required when you set Image Type to **Public Image**. When you use an image that supports Dynamic Host Configuration Protocol version 6 (DHCPv6) to create an instance, an IPv6 address is automatically assigned to the instance. The instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6: ■ Linux images: ■ CentOS 7.6 IPV6 64Bit ■ CentOS 6.10 64Bit ■ SUSE Linux Enterprise Server 12 SP4 64Bit ■ Windows Server images **Note** To use an IPv6 address to communicate over the Internet, you must enable public bandwidth for the IPv6 address. For more information, see the "Enable Internet bandwidth for an IPv6 address" topic in *Apsara Stack VPC User Guide*.
Custom Image	Subject to the image type	Select a custom image. Custom images are created from instances or snapshots or are imported from your device. This parameter is required when you set Image Type to **Custom Image**.
Shared Custom Image	Subject to the image type	Select a custom image that is shared by another Apsara Stack tenant. This parameter is required when you set Image Type to **Shared Custom Image**.

vi. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Select a disk category from the drop-down list and specify the system disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. The system disk capacity must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to create and attach data disks. For each data disk, select a disk category from the drop-down list and specify the disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. A maximum of 16 data disks can be attached to an instance. The maximum capacity of each data disk is 32 TiB. You can optionally select **Release with Instance** and **Encryption** for each data disk. To encrypt a data disk, configure the following parameters: ■ **Encryption Method**: Select **AES256**. ■ **Encryption Key**: You can select a key created in **Key Management Service (KMS)**. You can also add data disks after the instance is created. For more information, see Create a disk.

vii. Configure the logon password settings for the instance.

Parameter	Required	Description
Password Setting	Yes	Specify when to set a password. Valid values: **Set Now** and **Set After Purchase**. If you select Set After Purchase, you can use the password reset feature to set a password after the instance is created. For more information, see Change the logon password of an instance. **Note** The password is used to log on to the instance, not to a VNC management terminal.
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `( ) ` ~ ! @# $%^&*-_+=|{}[]:;'<>,.?/` **Note** This parameter is required when you set **Password Setting** to **Set Now**.
Confirm Password	No	Enter the password again. **Note** This parameter is required when you set **Password Setting** to **Set Now**.

viii. (Optional) Enter a name for the instance.

The name must be 2 to 128 characters in length and can contain `hyphens (-), underscores (_), and colons (:)`. It must start with a letter and cannot start with `http://` or `https://`.

If you do not specify a name, the system assigns one at random.

6. Click **Submit**.

Result

The new instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. When the instance is created, it enters the **Running** state.

2.1.3.5. Connect to an instance

2.1.3.5.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
  - Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X
  - Connect to a Linux-based instance by using remote connection tools in Windows

- Connect to a Windows-based instance by using RDP

- Use the VNC feature in the ECS console. For more information, see Connect to an instance by using a VNC management terminal.

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.1.3.5.2. Connect to a Linux instance by using SSH commands in Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux instance.

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the SSH port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	22/22	1	IPv4 CIDR block	0.0.0.0/0

Procedure

1. Enter the following command and press the Enter key.

```
ssh root@instance IP
```

2. Enter the instance password of the root user and press the Enter key.

2.1.3.5.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: .

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
   - Host Name (or IP Address): Enter the EIP of the instance to be connected.
   - Port: Select the default port 22.
   - Connection Type: Select SSH.
   - Saved Session: Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.

3. Click **Open** to connect to the instance.

   When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
4. Enter the username root and press Enter.
5. Enter the password for the instance and press Enter.

   If a message similar to the following one appears, a connection to the instance is established.

```
Welcome to aliyun Elastic Compute Server!
```

2.1.3.5.4. Connect to a Windows instance by using RDC

This topic describes how to connect to a Windows instance by using Remote Desktop Connection (RDC).

Prerequisites

- A security group and a Windows instance are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address is associated with the instance.
- An inbound security group rule is added to the security group to allow traffic on the RDP port.

Rule direction	Action	Protocol	Port range	Priority	Authorization type	Authorization object
Inbound	Allow	tcp	3389/3389	1	IPv4 addresses	0.0.0.0/0

Procedure

1. Use one of the following methods to enable RDC:
   - Click **Start**, enter *mstsc* in the search box, and click **mstsc** in the search result.
   - Press the Windows logo key+R. In the **Run** dialog box that appears, enter *mstsc* and click **OK**.
2. In the **Remote Desktop Connection** dialog box, enter the Elastic IP address of the instance and click **Show Options**.
3. Enter the username.

   The default username is administrator.
4. (Optional)If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.
6. In the **Windows Security** dialog box that appears, enter the password corresponding to the username you entered and click **OK**.

Result

If the Windows desktop appears, a connection to the Windows instance is established.

If an error message is returned indicating that an authentication error has occurred and the function requested is not supported, install CredSSP updates and try again. Follow these steps to install the updates:

1. Connect to an ECS instance by using the VNC.
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** section.

5. If updates are available, click **Install updates**.
6. Restart the instance.

2.1.3.5.5. Connect to an instance by using a VNC management terminal

If other remote connection tools such as PuTTy, Xshell, and SecureCRT are not installed or do not work properly, you can access your instances by using a VNC management terminal in the ECS console.

Prerequisites

- The instance to which you want to connect is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see Install the certificate for VNC in Windows.
- The VNC password is reset if it is your first time to connect to the instance after the instance is created. For more information, see Change the VNC password.

Context

The VNC password is used to log on to a VNC management terminal in the ECS console, whereas the instance password is used to log on to the instance.

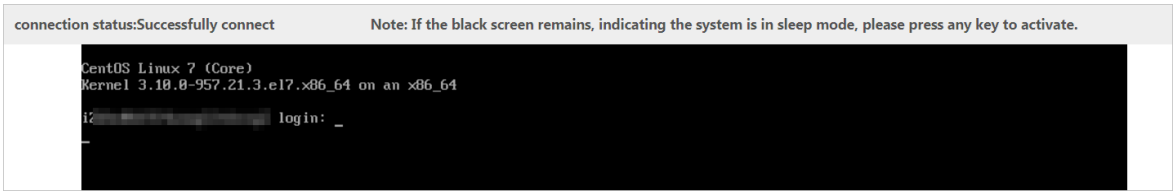
You can use a VNC management terminal to connect to an instance to solve specific issues. The following table lists some of the issues.

Issue	Solution
The instance starts slowly due to self-check on startup.	Check the self-check progress.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear and consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1.
2.
3.
4. Find the instance to which you want to connect and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password and click **OK**.

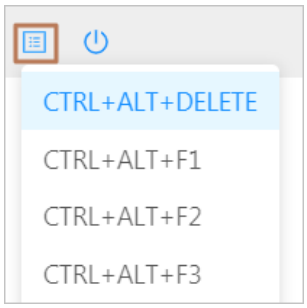
   After you are logged on to the VNC management terminal, a logon page similar to the following one appears.



6. Enter your username and password.
   - Fo a Linux instance, enter the username *root* and the logon password.

> **Note** Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

- For a Windows instance, to use a key combination such as Ctrl+Alt+Delete, click the List icon in the upper-right corner of the VNC page and select the corresponding key combination from the drop-down list.



Enter the username and password as prompted, and click the Log On icon such as  .

2.1.4. Instances

2.1.4.1. Create an instance

An Elastic Compute Service (ECS) instance is a virtual machine that contains the basic computing components of a server, such as CPU, memory, operating system, network settings, and disks.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see the "Create a VPC" and "Create a vSwitch" topics in *Apsara Stack VPC User Guide*.
- If you want to assign an IPv6 address to the instance that you want to create, make sure that the VPC and vSwitch are associated with IPv6 CIDR blocks. For more information, see the "Enable an IPv6 CIDR block for a VPC" and "Enable an IPv6 CIDR block for a vSwitch" topics in *Apsara Stack VPC User Guide*.
- One or more security groups are available. If no security groups are available, create one. For more information, see Create a security group.

Context

Some limits apply when you create GPU-accelerated instances. For more information, see Limits.

Procedure

1.
2.
3.
4. Click **Create Instance**.
5. Configure the parameters described in the following tables.
   i. Configure the basic settings of the instance.

Parameter	Required	Description
Organization	Yes	Select an organization.
Resource Set	Yes	Select a resource set.

ii. Select a region and zone for the instance.

Parameter	Required	Description
Region	Yes	Select a region.
Zone	Yes	Select a zone. Zones are the physical zones with separate power supplies and networks within the same region. The internal networks of zones are connected, and faults in one zone are isolated from the other zones. To increase the availability of your applications, we recommend that you create instances in different zones.

iii. Configure network settings for the instance.

Parameter	Required	Description
Network Type	Yes	Select a network type. Only **VPC** is supported.
VPC	Yes	Select a VPC.
vSwitch	Yes	Select a vSwitch.
Private IP Address	No	Specify a private IPv4 address for the instance. The private IPv4 address must be within the CIDR block of the selected vSwitch. If you do not specify a private IP address, the system allocates one to the instance.
IPv6	No	Specify whether to assign an IPv6 address to the instance.

iv. Configure instance settings such as security group, instance family, and instance type and specify the number of instances that you want to create.

Parameter	Required	Description
Security Group	Yes	Select a security group.
Deployment Set	No	Select a deployment set. You can use deployment sets to disperse or aggregate the instances involved in your business.
User Data	No	In the User Data field, enter the user data to be automatically run on instance startup. ■ Windows supports batch and PowerShell scripts. Before you perform Base64 encoding of user data, make sure that the data to be encoded includes `[bat]` or `[powershell]` as the first line. ■ Linux supports shell scripts.
Quantity	Yes	Specify the number of instances that you want to create. The number must be an integer within the range of 1 to 100.
Instance Family	Yes	Select an instance family. After you select an instance family, you must select an instance type.
Instance Type	Yes	Select an instance type. Information such as CPU, memory, and instance family level are displayed in the Instance Type list. Select an instance type based on your business needs. Instance types that have specific CPU and memory combinations do not support Windows Server images. For more information, see the "Limits" topic in *ECS Product Introduction*.

v. Configure the image to be used by the instance.

Parameter	Required	Description
Image Type	Yes	Select an image type. Valid values: **Public Image**, **Custom Image**, and **Shared Custom Image**.

Parameter	Required	Description
Public Image	Subject to the image type	Select a public image. Public images provided by Alibaba Cloud are licensed, secure, and stable. Public images include Windows Server images and major Linux images. This parameter is required when you set Image Type to **Public Image**. When you use an image that supports Dynamic Host Configuration Protocol version 6 (DHCPv6) to create an instance, an IPv6 address is automatically assigned to the instance. The instance can use this IPv6 address to communicate over the internal network. When you use an image that does not support DHCPv6 to create an instance, you must manually assign an IPv6 address to the instance. The following images support DHCPv6: ■ Linux images: ■ CentOS 7.6 IPV6 64Bit ■ CentOS 6.10 64Bit ■ SUSE Linux Enterprise Server 12 SP4 64Bit ■ Windows Server images **Note** To use an IPv6 address to communicate over the Internet, you must enable public bandwidth for the IPv6 address. For more information, see the "Enable Internet bandwidth for an IPv6 address" topic in *Apsara Stack VPC User Guide*.
Custom Image	Subject to the image type	Select a custom image. Custom images are created from instances or snapshots or are imported from your device. This parameter is required when you set Image Type to **Custom Image**.
Shared Custom Image	Subject to the image type	Select a custom image that is shared by another Apsara Stack tenant. This parameter is required when you set Image Type to **Shared Custom Image**.

vi. Configure the storage settings for the instance.

Parameter	Required	Description
System Disk	Yes	Select a disk category from the drop-down list and specify the system disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. The system disk capacity must range from 20 GiB to 500 GiB.
Data Disk	No	You can click Data Disk to create and attach data disks. For each data disk, select a disk category from the drop-down list and specify the disk capacity. Valid values for the disk category: **Ultra Disk** and **Standard SSD**. A maximum of 16 data disks can be attached to an instance. The maximum capacity of each data disk is 32 TiB. You can optionally select **Release with Instance** and **Encryption** for each data disk. To encrypt a data disk, configure the following parameters: ■ **Encryption Method**: Select **AES256**. ■ **Encryption Key**: You can select a key created in **Key Management Service (KMS)**. You can also add data disks after the instance is created. For more information, see Create a disk.

vii. Configure the logon password settings for the instance.

Parameter	Required	Description
Password Setting	Yes	Specify when to set a password. Valid values: **Set Now** and **Set After Purchase**. If you select Set After Purchase, you can use the password reset feature to set a password after the instance is created. For more information, see Change the logon password of an instance. **Note** The password is used to log on to the instance, not to a VNC management terminal.
Logon Password	No	Set the password to be used to log on to the instance. The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `( ) ` ~ ! @# $%^&*-_+=|{}[]:;'<>,.?/` **Note** This parameter is required when you set **Password Setting** to **Set Now**.
Confirm Password	No	Enter the password again. **Note** This parameter is required when you set **Password Setting** to **Set Now**.

viii. (Optional) Enter a name for the instance.

The name must be 2 to 128 characters in length and can contain `hyphens (-), underscores (_), and colons (:)`. It must start with a letter and cannot start with `http://` or `https://`.

If you do not specify a name, the system assigns one at random.

6. Click **Submit**.

Result

The new instance appears in the instance list. When the instance is being created, it is in the **Preparing** state. When the instance is created, it enters the **Running** state.

2.1.4.2. Connect to an instance

2.1.4.2.1. Instance connecting overview

After an instance is created, you can connect to the instance to perform operations such as installing applications.

You can use one of the following methods to connect to an instance:

- Use remote connection tools to connect to instances that have public IP addresses. For more information about the procedure, see the following topics:
  - Connect to a Linux-based instance by using SSH commands in Linux or Mac OS X
  - Connect to a Linux-based instance by using remote connection tools in Windows

- Connect to a Windows-based instance by using RDP

- Use the VNC feature in the ECS console. For more information, see Connect to an instance by using a VNC management terminal.

The username of a Windows instance is Administrator, and that of a Linux instance is root.

2.1.4.2.2. Connect to a Linux instance by using SSH commands in Linux or Mac OS X

This topic describes how to use SSH commands to connect to a Linux instance.

Prerequisites

- The instance and the security group are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address (EIP) is bound with the instance.
- An inbound security group rule is added to the security group to allow the SSH port.

Rule direction	Authorization policy	Protocol type	Port range	Priority	Authorization type	Authorization object
Inbound	Accept	TCP	22/22	1	IPv4 CIDR block	0.0.0.0/0

Procedure

1. Enter the following command and press the Enter key.

```
ssh root@instance IP
```

2. Enter the instance password of the root user and press the Enter key.

2.1.4.2.3. Connect to a Linux-based instance by using remote connection tools in Windows

This topic describes how to connect to an instance by using the PuTTY tool.

Prerequisites

Remote connection tools are designed with similar logics. In this example, PuTTY is used to connect to an instance. Download PuTTY at the following URL: .

Procedure

1. Download and install PuTTY for Windows.
2. Start the PuTTY client and complete the following settings:
   - Host Name (or IP Address): Enter the EIP of the instance to be connected.
   - Port: Select the default port 22.
   - Connection Type: Select SSH.
   - Saved Session: Enter the name of the session. Click **Save**. After the settings are saved, PuTTY remembers the name and IP address of the instance. This eliminates the need to enter them every time you connect to the instance.

3. Click **Open** to connect to the instance.

   When you connect to the instance for the first time, PuTTY displays security alerts. Click **Yes** to proceed.
4. Enter the username root and press Enter.
5. Enter the password for the instance and press Enter.

   If a message similar to the following one appears, a connection to the instance is established.

```
Welcome to aliyun Elastic Compute Server!
```

2.1.4.2.4. Connect to a Windows instance by using RDC

This topic describes how to connect to a Windows instance by using Remote Desktop Connection (RDC).

Prerequisites

- A security group and a Windows instance are created.
- The instance is in the **Running** state.
- A logon password is set for the instance.
- An Elastic IP address is associated with the instance.
- An inbound security group rule is added to the security group to allow traffic on the RDP port.

Rule direction	Action	Protocol	Port range	Priority	Authorization type	Authorization object
Inbound	Allow	tcp	3389/3389	1	IPv4 addresses	0.0.0.0/0

Procedure

1. Use one of the following methods to enable RDC:
   - Click **Start**, enter *mstsc* in the search box, and click **mstsc** in the search result.
   - Press the Windows logo key+R. In the **Run** dialog box that appears, enter *mstsc* and click **OK**.
2. In the **Remote Desktop Connection** dialog box, enter the Elastic IP address of the instance and click **Show Options**.
3. Enter the username.

   The default username is administrator.
4. (Optional)If you do not want to enter the password upon subsequent logons, select **Allow me to save credentials**.
5. Click **Connect**.
6. In the **Windows Security** dialog box that appears, enter the password corresponding to the username you entered and click **OK**.

Result

If the Windows desktop appears, a connection to the Windows instance is established.

If an error message is returned indicating that an authentication error has occurred and the function requested is not supported, install CredSSP updates and try again. Follow these steps to install the updates:

1. Connect to an ECS instance by using the VNC.
2. Choose **Start > Control Panel**.
3. Click **System and Security**.
4. Click **Check for updates** in the **Windows Updates** section.

5. If updates are available, click **Install updates**.
6. Restart the instance.

2.1.4.2.5. Install the certificate for VNC in Windows

Before you log on to the VNC management terminal, you must export the relative certificate from the site such as the Apsara Uni-manager Management Console and install the certificate in your local browser.

Context

The VNC feature is provided by the VNC proxy service. The VNC proxy service uses a certificate different from that of Apsara Infrastructure Management Framework. The certificate of the VNC proxy service must be manually imported.

Procedure

1. Export the certificate from the Apsara Uni-manager Management Console.
   i. Log on to the Apsara Uni-manager Management Console. Press the **F12** key or **Fn+F12** to view and select the certificate.

      For example, in the Chrome browser, press the **F12** key to open Chrome DevTools.

   ii. In the **Certificate** dialog box, click the **Certificate Path** tab, select the root certificate, and then click **View Certificate**.
   iii. In the **Certificate** dialog box, click the **Details** tab and then click **Copy to File**.
   iv. In the **Certificate Export Wizard** dialog box, click **Next**.
   v. Select **DER encoded binary X.509 (.CER)** as the format and then click **Next**.
   vi. Click **Browse**, choose where to store the certificate, enter a file name, and then click **Save**.
   vii. Click **Next**.
   viii. Click **Finish**.
   ix. Click **OK**.
2. Install the certificate in your local browser.

i. Double-click the certificate.
ii. In the **Certificate** dialog box, click **Install Certificate**.
iii. In the **Certificate Import Wizard** dialog box, click **Next**.
iv. Select **Place all certificates in the following store** and click **Browse**.
v. In the **Select Certificate Store** dialog box, select **Trusted Root Certificate Authority** and then click **OK**.
vi. In the **Certificate Import Wizard** dialog box, click **Next**.
vii. Click **Finish**.
viii. If a security warning message is displayed, click **Yes**.

3. Restart your browser and log on to the Apsara Uni-manager Management Console.

   After the certificate is installed, the security warning message is no longer displayed on the left of the URL when you log on to the Apsara Uni-manager Management Console.

2.1.4.2.6. Connect to an instance by using a VNC management terminal

If other remote connection tools such as PuTTy, Xshell, and SecureCRT are not installed or do not work properly, you can access your instances by using a VNC management terminal in the ECS console.

Prerequisites

- The instance to which you want to connect is in the **Running** state.
- The root certificate is imported to your web browser. For more information, see Install the certificate for VNC in Windows.
- The VNC password is reset if it is your first time to connect to the instance after the instance is created. For more information, see Change the VNC password.

Context

The VNC password is used to log on to a VNC management terminal in the ECS console, whereas the instance password is used to log on to the instance.

You can use a VNC management terminal to connect to an instance to solve specific issues. The following table lists some of the issues.

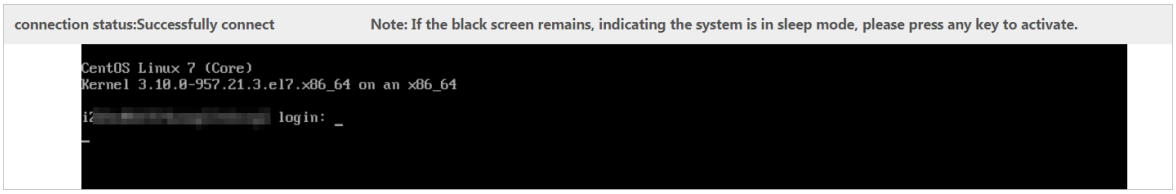
Issue	Solution
The instance starts slowly due to self-check on startup.	Check the self-check progress.
The firewall of the operating system is enabled by mistake.	Disable the firewall.
Abnormal processes appear and consume large amounts of CPU or bandwidth resources.	Troubleshoot and terminate the abnormal processes.

Procedure

1.
2.

3.
4. Find the instance to which you want to connect and click **Remote Connection** in the **Actions** column.
5. Enter the VNC password and click **OK**.

   After you are logged on to the VNC management terminal, a logon page similar to the following one appears.



6. Enter your username and password.
   - Fo a Linux instance, enter the username *root* and the logon password.

     Note Passwords in Linux are not displayed as you type. Press the Enter key after you enter the password.

   - For a Windows instance, to use a key combination such as Ctrl+Alt+Delete, click the List icon in the upper-right corner of the VNC page and select the corresponding key combination from the drop-down list.

   Enter the username and password as prompted, and click the Log On icon such as  .

2.1.4.3. View instances

You can view the list of instances and the details of individual instances. The details of an instance include basic configurations, disks, snapshots, security groups, and elastic network interfaces (ENIs).

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Instance Name	Enter an instance name to search for the instance.
Instance ID	Enter an instance ID to search for the instance.
IP Address	Enter the IP address of an instance to search for the instance.

Filter option	Description
VPC ID	Enter a VPC ID to search for instances that belong to the VPC.
Image ID	Enter an image ID to search for instances that use the image.
Status	Select an instance status to search for instances in that status. Valid values: ○ **Running** ○ **Stopped** ○ **Starting** ○ **Stopped**
Security Group ID	Enter a security group ID to search for instances that belong to the security group.
Operating System	Enter the name of operating system to search for instances that use the operating system.

5. Use one of the following methods to go to the Instance Details page of an instance:
   - In the **Instance ID/Name** column, click the instance ID.
   - Click **Manage** in the **Actions** column corresponding to the instance.
   - Choose **More > Show Details** in the **Actions** column corresponding to the instance.

2.1.4.4. Modify an instance

You can modify the names, descriptions, and user data of created instances.

Procedure

1.
2.
3.
4. Find the instance that you want to modify and choose **More > Modify** in the **Actions** column.
5. Modify the name, description, and user data of the instance.

   The name must be 2 to 128 characters in length. The description must be 2 to 256 characters in length. The user data must be 2 to 999 characters in length.
6. Click **OK**.

2.1.4.5. Stop an instance

You can stop instances that are not in use. The stop operation interrupts the services that are running on the instances. Exercise caution when you perform this operation.

Prerequisites

The instance that you want to stop is in the **Running** state.

Procedure

1.
2.
3.

4. Use one of the following methods to stop instances:
   - To stop a single instance, find the instance and choose **More > Instance Status > Stop** in the **Actions** column.
   - To stop one or more instances at a time, select the instances and click **Stop** in the lower-left corner of the Instances page.
5. Click **OK**.

Result

When the instance is being stopped, its status in the **Status** column changes from **Running** to **Stopping**. After the instance is stopped, its status changes to **Stopped**.

2.1.4.6. Start an instance

You can start stopped instances.

Prerequisites

The instance that you want to start is in the **Stopped** state.

Procedure

1.
2.
3.
4. Use one of the following methods to start instances:
   - To start a single instance, find the instance and choose **More > Instance Status > Start** in the **Actions** column.
   - To start one or more instances at a time, select the instances and click **Start** in the lower-left corner of the Instances page.
5. Click **OK**.

Result

When the instance is being started, its status in the **Status** column changes from **Stopped** to **Starting**. After the instance is started, its status changes to **Running**.

2.1.4.7. Restart an instance

You must restart instances after you change their logon passwords or install system updates for the instances. The restart operation stops the instances for a period of time. This causes the services that are running on the instances to be interrupted. Exercise caution when you perform this operation.

Prerequisites

The instance that you want to restart is in the **Running** state.

Procedure

1.
2.
3.
4. Use one of the following methods to restart instances:
   - To restart a single instance, find the instance and choose **More > Instance Status > Restart** in the **Actions** column.

- To restart one or more instances at a time, select the instances and click **Restart** in the lower-left corner of the Instances page.

5. In the Restart Instance dialog box, select a restart mode.
   - **Restart**: restarts the instances normally.
   - **Force Restart**: forcibly restarts the instances. This may result in loss of unsaved data.
6. Click **OK**.

2.1.4.8. Delete an instance

You can delete instances that are no longer needed to release their resources. Deleted instances cannot be recovered. We recommend that you back up data before you delete instances. If data disks are released along with instances, the data on the disks cannot be recovered.

Prerequisites

The instance to be deleted is in the **Stopped** state.

Procedure

1.
2.
3.
4. Select the instance that you want to delete and click **Delete** in the lower-left corner of the Instances page.
5. Click **OK**.

2.1.4.9. View the monitoring information of an instance

You can view monitoring charts in the CloudMonitor console to learn about the running conditions of Elastic Compute Service (ECS) instances. This topic describes how to go to the CloudMonitor console to view the monitoring information of an ECS instance.

Context

CloudMonitor provides real-time monitoring, alerting, and notification services for resources to protect your services and business. For more information, see **CloudMonitor overview** in *Apsara Uni-manager Management Console User Guide*.

Procedure

1.
2.
3.
4. Find the ECS instance whose monitoring information you want to view and click **Monitor** in the Monitoring column.
5. On the **Monitoring Charts** page, view the monitoring information of the ECS instance.

2.1.4.10. Change the instance type of an instance

You can change the instance types of instances to suit your business needs. This eliminates the need to create new instances.

Hot configuration change

You can perform a hot configuration change on an instance that is not in the Stopped state to change its instance type.

> **Note** Only specific instance types support hot configuration changes. The instance types that support hot configuration changes are displayed in the Elastic Compute Service (ECS) console.

1.
2.
3.
4. Find the ECS instance whose instance type you want to change and click **Hot Configuration Change** in the **Actions** column.
5. On the Change Configurations of ECS Instance without Service Interruption page, select a new instance type and click **Submit**.

   The Change Configurations of ECS Instance without Service Interruption page shows the instance types available for selection.

Upgrade and downgrade

You can upgrade or downgrade the instance type of an instance that is in the **Stopped** state.

1.
2.
3.
4. Find the instance whose instance type you want to change and click **Upgrade/Downgrade** in the **Actions** column.
5. On the Change Configurations of ECS Instance page, select a new instance type and click **Submit**.

   The Change Configurations of ECS Instance page shows the instance types available for selection.
6. Restart the instance by using the ECS console or by calling an API operation for the new instance type to take effect.

   For more information, see Start an instance or the "StartInstance" topic in *ECS Developer Guide*.

2.1.4.11. Change the logon password of an instance

If you did not set a logon password when you created an instance or have forgotten the password, you can reset the password.

Procedure

1.
2.
3.
4. Find the instance whose logon password you want to change and use one of the following methods to go to the Instance Details page.
   - In the **Instance ID/Name** column, click the ID of the instance.
   - Click **Manage** in the **Actions** column.
   - In the **Actions** column, choose **More > Show Details**.
5. Click **Change Password**.
6. Enter and confirm the new password, and then click **OK**.

   The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `( ) ' ~ ! @ # $ % ^ & * - _ + = | { } [ ] : ; ' < > , . ? /`
7. Restart the instance by using the ECS console or by calling an API operation for the new password to take

effect.

For more information, see Restart an instance or the "RebootInstance" topic in *ECS Developer Guide*.

2.1.4.12. Change the VNC password

If you use Virtual Network Console (VNC) to connect to an Elastic Compute Service (ECS) instance for the first time or if you forget the VNC password, you can reset the VNC password.

Procedure

1.
2.
3.
4. Find the instance whose VNC password you want to change and use one of the following methods to go to the Instance Details page:
   - On the Instances page, click the instance ID in the **Instance ID/Name** column.
   - On the Instances page, click **Manage** in the **Actions** column.
   - On the Instances page, choose **More > Show Details** in the **Actions** column.
5. Click **Change VNC Password**.
6. Enter and confirm the new password, and click **OK**.

   The password must be 8 to 14 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `! / | \@~`#$%^*()_-+={[}]:;,.?` .

   > **Note** If your instance is a non-I/O optimized instance, you must restart the instance in the ECS console for the new password to take effect.

2.1.4.13. Add an instance to a security group

You can add created instanced to security groups and use security group rules to control network access for the instances.

Context

Security groups act as virtual firewalls to provide security isolation and implement network access control for instances.

Security groups determine whether the instances in the same account that are deployed within the same VPC and region can communicate with each other. By default, if the instances belong to the same security group, they can communicate with each other over the internal network. If the instances belong to different security groups, you can authorize mutual access between the security groups to allow the instances to communicate with each other over the internal network.

Procedure

1.
2.
3.
4. Find the security group to which you want to add an instance and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. In the Add Instance dialog box, select an instance and click **OK**.

An instance can belong to up to five security groups. After an instance is added to a security group, the rules of the security group automatically apply to the instance.

2.1.4.14. Customize instance data

ECS allows you to run the instance customization script upon startup and import data into instances.

Context

The instance data customization feature is applicable to both Windows and Linux instances. It allows you to:

- Run the instance customization script upon startup.
- Import data into instances.

Usage instructions

- **Limits**

  The instance data customization feature can only be used when an instance meets all the following requirements:

  - Network type: VPC
  - Image: a system image or a custom image that is inherited from the system image
  - Operating system: one type included in Supported operating systems Supported operating systems

Windows	Linux
■ Windows Server 2016 64-bit ■ Windows Server 2012 64-bit ■ Windows Server 2008 64-bit	■ CentOS ■ Ubuntu ■ SUSE Linux Enterprise ■ OpenSUSE ■ Debian ■ Aliyun Linux

  - When you configure instance data customization scripts, you must enter custom data based on the type of operating system and script.

    Note Only English characters are allowed.

    - If your data is Base64 encoded, select **Enter Base64 Encoded Information**.

      Note The size of the customization script cannot exceed 16 KB before the data is Base64 encoded.

    - For Linux instances, the script format must meet the requirements described in Types of Linux instance customization scripts.
    - For Windows instances, the script can only start with `[bat]` or `[powershell]`.

- After starting an instance, run a command to view the following information:
  - Execution result of the instance customization script
  - Data imported to instances

- **Console**: You can modify the custom instance data in the console. Whether the modified instance customization script needs to be re-executed depends on the script type. For example, if the `bootcmd` script in Cloud Config is modified for Linux instances, the script is automatically executed each time instances are restarted.

- **OpenAPI**: You can also use OpenAPI to customize instance data. For more information, see **CreateInstance** and **ModifyInstanceAttribute** in *ECS Developer Guide*.

Linux instance data customization scripts

Linux instance data customization scripts provided by Alibaba Cloud are designed based on the cloud-init architecture. They are used to automatically configure parameters of Linux instances. Customization script types are compatible with the cloud-init.

Description of Linux instance data customization scripts

- Linux instance customization scripts are executed after instances are started and before `/etc/init` is executed.
- Linux instance customization scripts can only be executed with root permissions by default.

Types of Linux instance customization scripts

- **User-Data Script**
  - Description: A script, such as shell script, is used to customize data.
  - Format: The first line must include `#!`, such as `#! /bin/sh`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script is executed only when instances are started for the first time.
  - Example:

```
#! /bin/sh
echo "Hello World. The time is now $(date -R)!" | tee /root/output10.txt
```

- **Cloud Config Data**
  - Description: Predefined data is used to configure services, such as specifying yum sources or importing SSH keys.
  - Format: The first line must be `#cloud-config`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script execution frequency varies with the specific service.
  - Example:

```
#cloud-config
apt:
primary:
- arches: [default]
uri: http://us.archive.ubuntu.com/ubuntu/
```

- **Include**
  - Description: The configuration content can be saved in a text file and imported into cloud-init as a URL.
  - Format: The first line must be `#include`.
  - Limit: The script size (including the first line) cannot exceed 16 KB before the data is Base64 encoded.
  - Frequency: The script execution frequency depends on the script type in the text file.
  - Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/cloudconfig
```

- **GZIP format**
  - Description: Cloud-ini limits the size of customization scripts to 16 KB. You can compress and import the script file into the customization script if the file size exceeds 16 KB.

- Format: The .gz file is imported into the customization script as a URL in `#include`.
- Frequency: The script execution frequency depends on the script content contained in the GZIP file.
- Example:

```
#include
http://ecs-image-test.oss-cn-hangzhou.aliyuncs.com/userdata/config.gz
```

View the custom data of a Linux instance

Run the following command in the instance:

```
curl http://100.100.100.200/latest/user-data
```

Windows instance customization scripts

Windows instance customization scripts independently developed by Alibaba Cloud can be used to initialize Windows instances.

There are two types of Windows instance customization scripts:

- Batch processing program: starts with `[bat]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.
- PowerShell script: starts with `[powershell]` and serves as the first line. The script size must be smaller than 16 KB before the data is Base64 encoded.

View the custom data of a Windows instance

Run the following PowerShell command in the instance:

```
Invoke-RestMethod http://100.100.100.200/latest/user-data/
```

2.1.4.15. Change the private IP address of an instance

Each instance is assigned a private NIC and associated with a private IP address. You can change the private IP address of an instance. The new private IP address must be within the CIDR block of the vSwitch to which the instance is connected and must not be in use by another instance.

Prerequisites

The instance whose private IP address you want to change is in the **Stopped** state.

Procedure

1.
2.
3.
4. Find the instance whose private IP address you want to change and choose **More > Change Private IP Address** in the **Actions** column.
5. Enter a new private IP address.

   The new private IP address must be within the CIDR block of the vSwitch to which the instance is connected. This IP address must not be in use by another instance or be reserved for a specific purpose.

   For example, if the CIDR block of the vSwitch is 192.168.1.0/24, you can use an IP address within the range from 192.168.1.1 to 192.168.1.254. The first address 192.168.1.0 is reserved to identify the subnet itself, and the last address 192.168.1.255 is reserved as the broadcast address. Neither address can be used.
6. Click **OK**.

2.1.4.16. Enable IPv6

Compared with IPv4 addresses, IPv6 addresses are more sufficient and allow more types of devices to access the Internet. If your network environment supports IPv6, you can assign IPv6 addresses for exiting Elastic Compute Service (ECS) instances.

Prerequisites

- The virtual private cloud (VPC) of the ECS instance to which you want to assign an IPv6 address is associated with an IPv6 CIDR block. For more information, see the "Enable an IPv6 CIDR block for a VPC" topic in *Apsara Stack VPC User Guide*.
- The vSwitch connected to the ECS instance to which you want to assign an IPv6 address is associated with an IPv6 CIDR block. For more information, see the "Enable an IPv6 CIDR block for a vSwitch" topic in *Apsara Stack VPC User Guide*.
- The instance family of the ECS instance supports IPv6.

Procedure

1. Log on to the ECS console.
2.
3.
4. Find the instance to which you want to assign an IPv6 address and choose **More > Manage Secondary Private IPv6 Addresses** in the **Actions** column.
5. In the **Manage Secondary Private IPv6 Addresses** dialog box, click **Open Now** next to the **IPv6 Addresses** field.

   > **Note** Specific instance families do not support IPv6.

6. On the vSwitch page, check whether IPv6 is enabled for the vSwitch.

   If IPv6 is not enabled for the vSwitch, click **Enable IPv6 CIDR Block** in the **IPv6 CIDR Block** column corresponding to the vSwitch.
7. In the **Manage Secondary Private IPv6 Addresses** dialogue box, click **OK**.

Result

After the configuration is complete, you can click the instance ID and check whether an **IPv6** address is assigned to the instance on the **Instance Details** page.

2.1.4.17. Install the CUDA and GPU drivers for a Linux instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.

Context

When installing NVIDIA drivers, you must install the kernel package that contains the kernel header file before you install the CUDA and GPU drivers on the instance.

Procedure

1. Install the kernel package.

i. Run the **uname -r** command to view the current kernel version.

A similar output is displayed:

- CentOS: `3.10.0-862.14.4.el7.x86_64`
- Ubuntu: `4.4.0-117-generic`

ii. Copy the kernel package of the corresponding version to the instance and install the package.

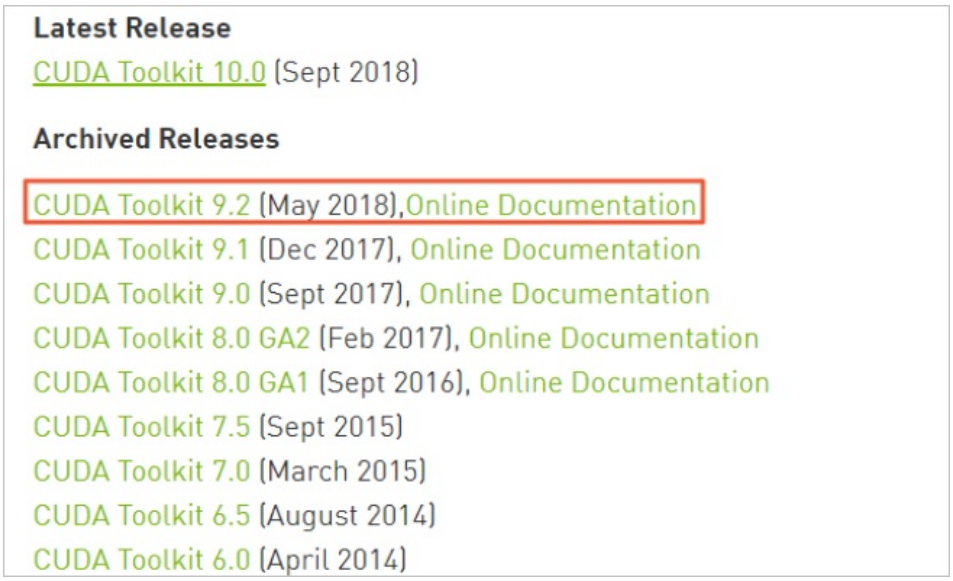
- CentOS: Copy the RPM package of the `kernel-devel` component and run the **rpm -ivh 3.10.0-862.14.4.el7.x86_64.rpm** command to install the package. *3.10.0-862.14.4.el7.x86_64.rpm* is used as an example. Replace it with the actual package name.
- Ubuntu: Copy the DEB package of the `linux-headers` component and run the **dpkg -i 4.4.0-117-generic.deb** command to install the package. *4.4.0-117-generic.deb* is used as an example. Replace it with the actual package name.

2. Download the CUDA Toolkit.

i. Access the official CUDA download page. Choose the version based on the GPU application requirements for CUDA.

This example uses CUDA Toolkit 9.2.

Download the CUDA Toolkit



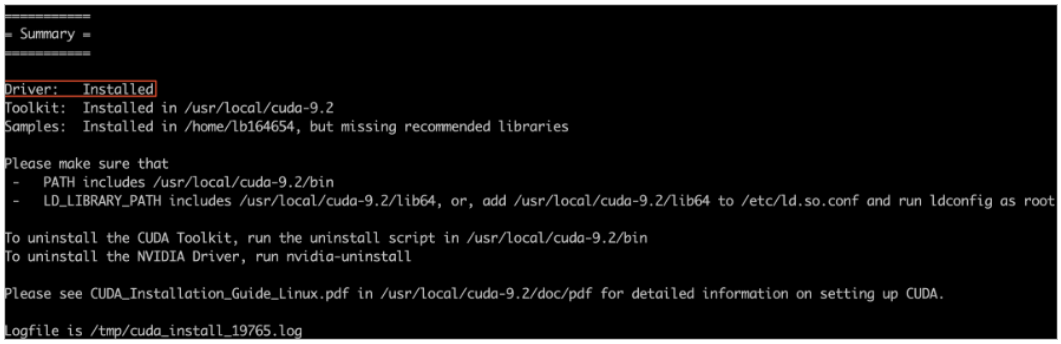
ii. Choose a platform based on your operating system. Select **Installer Type** to **runfile (local)** and click **Download**.

NVIDIA drivers are already included in the CUDA Toolkit.

Download the drivers

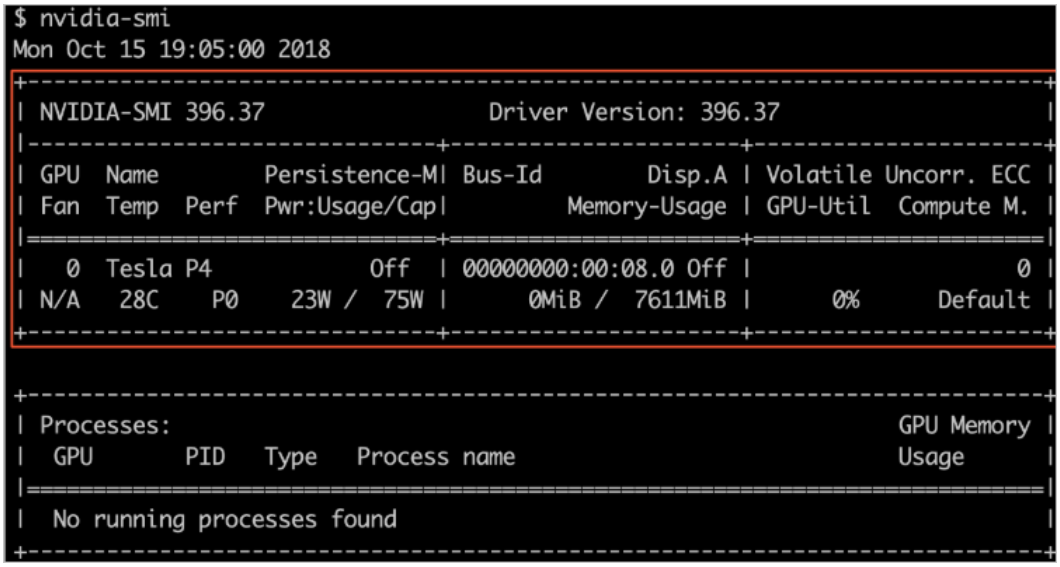
3. Copy the downloaded *cuda_9.2.148_396.37_linux.run* file to the instance. *cuda_9.2.148_396.37_linux.run* is used as an example. Replace it with the actual file name.
4. Run the **sudo sh ./cuda_9.2.148_396.37_linux.run --silent --verbose --driver --toolkit --samples** command to install the CUDA driver. *cuda_9.2.148_396.37_linux.run* is used as an example. Replace it with the actual file name.
   The installation takes about 10 to 20 minutes. When `Driver: Installed` is displayed, the installation is successful.

   View the CUDA installation result



5. Run the **nvidia-smi** command to view the GPU driver status.
   If the output displays the details of the GPU driver, the driver is running properly.

   View the GPU driver status



What's next

If you want to run the OpenGL program, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.1.4.18. Install the CUDA and GPU drivers for a Windows instance

You must install a GPU driver on GPU instances to use the GPU. If the image you use does not contain a pre-installed GPU driver, you must manually install the CUDA and GPU drivers for the instance.

Prerequisites

- If your instance cannot connect to the Internet, the installation file cannot be downloaded. You can install an FTP client on the instance to transfer the installation file to the instance.
- To compile CUDA programs, first install a Windows compiling environment, such as Visual Studio 2015. If you do not need to compile CUDA programs, ignore it.

Procedure

1. Download the CUDA Toolkit.
   i. Access the official CUDA download page. Choose the version based on the GPU application requirements for CUDA.

      This example uses CUDA Toolkit 9.2.

   ii. Choose a platform based on your operating system. Set **Installer Type** to **exe (local)** and click **Download**.

      NVIDIA drivers are already included in the CUDA Toolkit.
2. Copy the downloaded *cuda_9.2.148_windows.exe* file to the instance. *cuda_9.2.148_windows.exe* is used as an example. Replace it with the actual file name.
3. Double-click *cuda_9.2.148_windows.exe* and follow the installation wizard to install the CUDA driver. *cuda_9.2.148_windows.exe* is used as an example. Replace it with the actual file name.
   The installation takes about 10 to 20 minutes. When `Installed: - Nsight Monitor and HUD Launcher` is displayed, the driver is installed.
4. Press *Win + R* and enter **devmgmt.msc**.
   The NVIDIA device is displayed in **Display Adapter**.
5. Press *Win + R*, enter **cmd**, and run the **"C:\Program Files\NVIDIA Corporation\NVSMI\nvidia-smi"**

command.
If the output displays the details of the GPU driver, the driver is running properly.

What's next

If you want to run the OpenGL and DirectX programs, you must first purchase the licenses and install the GRID drivers. For information about the installation procedure, see the official NVIDIA documentation.

2.1.5. Disks

2.1.5.1. Create a disk

You can create standalone data disks and then attach them to ECS instances to increase the storage space of the instances. This topic describes how to create an empty data disk. You cannot create standalone system disks.

Context

We recommend that you determine the number and sizes of data disks before you create them. The following limits apply to data disks:

- A maximum of 16 data disks can be attached to an instance. Disks and Shared Block Storage devices share this quota.
- Each Shared Block Storage device can be attached to up to four ECS instances at the same time.
- Each ultra disk, standard SSD, Ultra Shared Block Storage device, or SSD Shared Block Storage device can have a maximum capacity of 32 TiB.
- Disks cannot be combined in ECS. They are independent of each other. You cannot combine multiple disks into one by formatting them.

We recommend that you do not use Logical Volume Manager (LVM) to create logical volumes across multiple disks, because a snapshot can back up data only of a single disk. If you create a logical volume across several disks, data discrepancies may occur when you restore these disks.

Procedure

1.
2.
3.
4. Click **Create Disk**.
5. Configure the parameters listed in the following table to create a disk.

Type	Parameter	Required	Description
Region	Organization	Yes	Select an organization in which to create the disk.
	Resource Set	Yes	Select a resource set in which to create the disk.
	Region	Yes	Select a region in which to create the disk.
	Zone	Yes	Select a zone in which to create the disk.
	Name	Yes	Enter a name for the disk. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).

Type	Parameter	Required	Description
Basic Settings	Specifications	Yes	Select a disk category and specify the disk size. Valid values for the disk category: ○ **Standard SSD**: standard SSD ○ **Ultra Disk**: ultra disk ○ **Shared SSD**: SSD Shared Block Storage device ○ **Shared Ultra Disk**: Ultra Shared Block Storage device The disk size must range from 20 GiB to 32,768 GiB.
	Encrypted	No	Specify whether to encrypt the disk.
	Encryption Method	No	Select an encryption algorithm. This parameter is required when you set **Encrypted** to **Yes**. Valid values: ○ **AES256** ○ **SM4**
	Encryption Key	No	Select a key to be used to encrypt the disk. This parameter is required when you set **Encrypted** to **Yes**. **Note** If no key is available, create a key in KMS.
	Use Snapshot	No	Specify whether to create the disk from a snapshot. If you select **Yes**, you must specify a snapshot. The size of the created disk depends on the size of the specified snapshot. ○ If the disk size that you specify is greater than the snapshot size, the disk is created with the size you specify. ○ If the disk size that you specify is smaller than the snapshot size, the disk is created with the snapshot size.

6. Click **Submit**.

Result

The created disk is displayed in the disk list and in the **Pending** state.

What's next

After the disk is created, you must attach the disk to an instance and partition and format the disk. For more information, see the following topics:

- Attach a disk
- Format a data disk for a Linux instance
- Format a data disk of a Windows instance

2.1.5.2. Attach a disk

You can attach separately created disks as data disks to instances. To attach a disk to an instance, make sure that the disk and the instance are located within the same region and zone.

Prerequisites

The disk that you want to attach is in the **Available** state.

Context

- You do not need to attach data disks that are created together with instances.
- A disk can be attached only to a single instance within the same region and zone.
- Each disk can be attached only to a single instance at the same time.
- Each Shared Block Storage device can be attached to up to four instances at the same time.

Attach a disk on the instance details page

To attach multiple disks to an instance, you can go to the details page of the instance.

1.
2.
3.
4. Find the instance to which you want to attach a disk and click the instance ID.
5. Click the **Disks** tab.
6. Click **Attach**.
7. In the Attach dialog box, select a disk from the **Disk** drop-down list.
8. Click **OK**.

Attach a disk on the Disks page

To attach multiple disks to different instances, you can go to the Disks page.

1.
2.
3.
4. Find the disk that you want to attach and choose **More > Attach** in the **Actions** column.
5. Specify the destination instance and configure the release mode.
   - If you select **Release Disk with Instance**, the disk will be released when its associated instance is deleted.
   - If you do not select **Release Disk with Instance**, the disk will be retained and enter the **Available** state when its associated instance is deleted.
6. Click **OK**.

2.1.5.3. Partition and format disks

2.1.5.3.1. Format a data disk for a Linux instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Linux instance.

Prerequisites

The disk has been attached to the instance.

Procedure

1. Connect to the instance.

2. Run the **fdisk -l** command to view all data disks attached to the ECS instance.

   If */dev/vdb* is not displayed in the command output, the ECS instance does not have a data disk. Check whether the data disk is attached to the instance.

```
[root@iZ********eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c
Device Boot      Start         End      Blocks   Id  System
/dev/vda1   *           1        5222    41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

3. Create partitions for the data disk.
   i. Run the **fdisk /dev/sdb** command.
   ii. Enter *n* to create a new partition.
   iii. Enter *p* to set the partition as the primary partition.
   iv. Enter a partition number and press the Enter key. In this example, *1* is entered to create Partition 1.
   v. Enter the number of the first available sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 41610 and press the Enter key.
   vi. Enter the number of the last sector. This example uses the default value. This is done by pressing the Enter key. You can also enter a value from 1 to 11748 and press the Enter key.
   vii. (Optional)Optional. To create multiple partitions, repeat steps b through f until all four primary partitions are created.
   viii. Run the **wq** command to start partitioning.

```
[root@iZ********eZ ~]# fdisk /dev/vdb
Device contains neither a valid DOS partition table, nor Sun, SGI or OSF disklabel
Building a new DOS disklabel with disk identifier 0x01ac58fe.
Changes will remain in memory only, until you decide to write them.
After that, of course, the previous content won't be recoverable.
Warning: invalid flag 0x0000 of partition table 4 will be corrected by w(rite)
WARNING: DOS-compatible mode is deprecated. It's strongly recommended to
         switch off the mode (command 'c') and change display units to
         sectors (command 'u').
Command (m for help): n
Command action
   e   extended
   p   primary partition (1-4)
p
Partition number (1-4): 1
First cylinder (1-41610, default 1):
Using default value 1
Last cylinder, +cylinders or +size{K,M,G} (1-41610, default 41610):
Using default value 41610
Command (m for help): wq
The partition table has been altered!
```

4. Run the **fdisk -l** command to view the partitions.

If */dev/vdb1* is displayed in the command output, new partition *vdb1* is created.

```
[root@iZ********eZ ~]# fdisk -l
Disk /dev/vda: 42.9 GB, 42949672960 bytes
255 heads, 63 sectors/track, 5221 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00078f9c
Device Boot      Start         End      Blocks   Id  System
/dev/vda1   *           1        5222    41940992   83  Linux
Disk /dev/vdb: 21.5 GB, 21474836480 bytes
16 heads, 63 sectors/track, 41610 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x01ac58fe
Device Boot      Start         End      Blocks   Id  System
/dev/vdb1               1       41610    20971408+  83  Linux
```

5. Format the new partition. In this example, the new partition is formatted as ext3 after you run the **mkfs.ext3 /dev/vdb1** command.

   The time required for formatting depends on the disk size. You can also format the new partition to another file system. For example, you can run the **mkfs.ext4 /dev/vdb1** command to format the partition as ext4.

   Compared with ext2, ext3 only adds the log function. Compared with ext3, ext4 improves on some important data structures. ext4 provides better performance and reliability, and more functions.

```
[root@iZ********leZ ~]# mkfs.ext3 /dev/vdb1
mke2fs 1.41.12 (17-May-2010)
Filesystem label=
OS type: Linux
Block size=4096 (log=2)
Fragment size=4096 (log=2)
Stride=0 blocks, Stripe width=0 blocks
1310720 inodes, 5242852 blocks
262142 blocks (5.00%) reserved for the super user
First data block=0
Maximum filesystem blocks=4294967296
160 block groups
32768 blocks per group, 32768 fragments per group
8192 inodes per group
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912, 819200, 884736, 1605632, 2654208,
    4096000
Writing inode tables: done
Creating journal (32768 blocks): done
Writing superblocks and filesystem accounting information: done
This filesystem will be automatically checked every 25 mounts or
180 days, whichever comes first.  Use tune2fs -c or -i to override.
```

6. Run the `echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab` command to write the information of the new partition to the /etc/fstab file. You can run the `cat /etc/fstab` command to view the new partition information.

   Ubuntu 12.04 does not support barriers. To write the information of the new partition into the /etc/fstab file, you must run the `echo '/dev/vdb1 /mnt ext3 barrier=0 0 0' >> /etc/fstab` command.

   In this example, the partition information is added to the ext3 file system. You can also modify the ext3 parameter to add the partition information to another type of file system.

To attach the data disk to a specific folder, for example, to store web pages, modify the /mnt part of the preceding command.

```
[root@iZ********eZ ~]# echo '/dev/vdb1 /mnt ext3 defaults 0 0' >> /etc/fstab
[root@iZbp19cdhgdj0aw5r2izleZ ~]# cat /etc/fstab
#
# /etc/fstab
# Created by anaconda on Thu Aug 14 21:16:42 2014
#
# Accessible filesystems, by reference, are maintained under '/dev/disk'
# See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for more info
#
UUID=94e4e384-0ace-437f-bc96-057dd64f**** / ext4 defaults,barrier=0 1 1
tmpfs                   /dev/shm                tmpfs   defaults        0 0
devpts                  /dev/pts                devpts  gid=5,mode=620  0 0
sysfs                   /sys                    sysfs   defaults        0 0
proc                    /proc                   proc    defaults        0 0
/dev/vdb1 /mnt ext3 defaults 0 0
```

7. Mount the new partitions. Run the **mount -a** command to mount all the partitions listed in */etc/fstab* and run the **df -h** command to view the result.

   If the following information is displayed, the new partitions are mounted and available for use.

```
[root@iZ********eZ ~]# mount -a
[root@iZ********eZ ~]# df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/vda1        40G  5.6G   32G  15% /
tmpfs           499M     0  499M   0% /dev/shm
/dev/vdb1        20G  173M   19G   1% /mnt
```

2.1.5.3.2. Format a data disk of a Windows instance

Data disks created separately are not partitioned or formatted. This topic describes how to partition and format a data disk of a Windows instance. This example uses Windows Server 2008.

Prerequisites

The disk has been attached to an instance.

Procedure

1. In the lower-left corner of the screen, click the **Server Manager** icon.
2. In the left-side navigation pane of the Server Manager window, choose **Storage > Disk Management**.
3. Right-click an empty partition and select **New Simple Volume** from the shortcut menu.

   If the disk status is **Offline**, change it to **Online**.
4. Click **Next**.
5. Set the size of the simple volume, which is the partition size. Then click **Next**.

   The default value is the maximum value of the disk space. You can specify the partition size as needed.
6. Specify the drive letter and then click **Next**.
7. Specify the formatting options and then click **Next**.

   We recommend that you format the partition with the default settings provided by the wizard.
8. When the wizard prompts that the partition has been completed, click **Finish** to close the wizard.

2.1.5.4. View disks

You can view the list of disks and the details of individual disks.

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search box, and click **search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Disk Name	Enter a disk name to search for the disk.
Disk ID	Enter a disk ID to search for the disk.
Instance ID	Enter an instance ID to search for disks that are attached to the instance.
Disk Status	Select a disk status to search for disks in that status. Valid values: ○ **Running** ○ **Pending** ○ **Attaching** ○ **Detaching** ○ **Creating** ○ **Deleting** ○ **Deleted** Note Deleted disks are no longer displayed in the disk list. ○ **Initializing** ○ **All Statuses**
Disk Properties	Select a disk type to search for disks of that type. Valid values: ○ **All** ○ **System Disk** ○ **Data Disk**
Policy ID	Enter the ID of an automatic snapshot policy to search for disks that use the policy.
Encryption Key ID	Enter the ID of an encryption key to search for disks that are encrypted by using the key.

5. In the **Disk ID/Name** column, click a disk ID to go to the Disk Details page of the disk.

   The properties and mount information of the disk are displayed on the Disk Details page.

2.1.5.5. Restore a disk

If you have created snapshots for a disk, you can use one of the snapshots to restore the disk to the state when the snapshot was created. The disk restore operation is irreversible. After the disk is restored, the data stored on the disk before the restore operation is performed cannot be recovered. Exercise caution when you perform this operation.

Prerequisites

- Snapshots are created for the disk that you want to restore.
- The disk is not released.
- The instance to which the disk is attached is in the **Stopped** state.

Procedure

1.
2.
3.
4. Select a filtering option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filtering options to narrow down the search results.

Filtering option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for the snapshots related to the instance.
Disk ID	Enter a disk ID to search for the snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for the snapshots of that type. Options include: ○ **All** ○ **User Snapshots**: manual snapshots. ○ **Automatic snapshots**: automatic snapshots.
Creation Time	Enter a creation time to search for the snapshots that were created at that time.

5. Find the snapshot that you want to use to restore the specified disk and click **Restore Disk** in the **Actions** column.
6. Click **OK**.

2.1.5.6. Modify the attributes of a disk

You can modify the attributes of created disks, such as the settings of the Release Disk with Instance and Release Automatic Snapshots with Disk options.

Procedure

1.
2.
3.

4. Find the disk whose attributes you want to modify and choose **More > Modify Disk Properties** in the **Actions** column.
5. Modify the Release Mode settings.
   - **Release Disk with Instance**: If this option is selected, the disk will be released when its associated instance is deleted. If this option is not selected, the disk will be retained and enter the **Pending** state when its associated instance is deleted.
   - **Release Automatic Snapshots with Disk**: If this option is selected, the automatic snapshots of the disk will be released when the disk is deleted. If this option is not selected, the automatic snapshots will be retained when the disk is deleted.
6. Click **OK**.

2.1.5.7. Modify the description of a disk

You can modify the names and descriptions of created disks.

Procedure

1.
2.
3.
4. Find the disk that you want to modify and choose **More > Modify Disk Description** in the **Actions** column.
5. Modify the name and description of the disk.

   The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), colons (:), and hyphens (-).

   The description must be 2 to 256 characters in length and cannot start with http:// or https://.
6. Click **OK**.

2.1.5.8. Expand a disk

You can expand system disks or data disks online. After a disk is expanded, you do not need to restart the instance to which the disk is attached for the new disk capacity to take effect.

Prerequisites

- To avoid data loss, we recommend that you create a snapshot to back up disk data before you expand a disk. For more information, see Create a snapshot.
- No snapshot is being created for the disk to be expanded.
- The following requirements are met:
  - If the disk is a system disk, the associated instance is in the **Running** state.
  - If the disk is a data disk, one of the following requirements is met:
    - The disk is in the **Pending** state.
    - If the disk is attached to an instance, the instance is in the **Running** state.
  - If the disk is a Shared Block Storage device, it is in the **Pending** state.

Context

The following limits apply when you expand a disk.

Limit	Description

Limit	Description
Disk category	• Ultra disks and standard SSDs can be expanded. • SSD Shared Block Storage and Ultra Shared Block Storage devices can be expanded.
Operating system	The system disks of Windows Server 2003 instances cannot be expanded.
Partitioning mode	Data disks that use the MBR partitioning scheme cannot be expanded to larger than 2 TiB in size. To expand an MBR data disk to larger than 2 TiB in size, we recommend that you create and attach a new data disk larger than 2 TiB in size, use the GPT partitioning scheme to partition this new data disk, and then copy data from the original MBR data disk to the new GPT data disk.
File system	For Windows instances, only disks that use NTFS file systems can be expanded.
Maximum capacity	• Ultra disk and standard SSD: 32,768 GiB • SSD Shared Block Storage device and Ultra Shared Block Storage device: 32,768 GiB
Related operations	• When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate the storage space on a disk after the disk is expanded. • You cannot shrink an expanded disk by any means, such as by rolling it back.

Procedure

1.
2.
3.
4. Find the disk that you want to expand and choose **More > Expand Disk** in the **Actions** column.
5. In the Expand Disk dialog box, specify a new capacity for the disk.

   The new capacity must be greater than the current capacity.
6. Click **OK**.

Result

When you expand disks, only the capacity of the disks is expanded. The sizes of partitions and file systems do not change. You must manually re-allocate the storage space on a disk after the disk is expanded.

2.1.5.9. Encrypt a disk

2.1.5.9.1. Encrypt a system disk

In the scenarios that require data security and regulatory compliance, you can encrypt disks to secure your data stored on the disks. To encrypt system disks, you can encrypt custom images and then use the encrypted custom images to create instances. The system disks of the created instances are automatically encrypted.

Context

You can encrypt system disks only by encrypting custom images.

Step 1: Create a custom image from an instance

1.

2.
3.
4. Find the snapshot from which you want to create a custom image and click **Create Custom Image** in the **Actions** column.
5. Configure the parameters listed in the following table to create a custom image.

Parameter	Description
Custom Image Name	Enter a name for the custom image. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter.
Sharing Scope	Select the scope in which to share the custom image. ○ **Current Organization and Subordinate Organizations** ○ **Current Resource Set** ○ **Current Organization**
Description	Enter a description for the custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

6. Click **OK**.

Step 2: Encrypt the custom image

1.
2.
3.
4. Click the **Custom Images** tab.
5. Find the custom image that you want to encrypt and click **Encrypt Image** in the **Actions** column.
6. In the **Encrypt Image** dialog box, configure the parameters listed in the following table.

Parameter	Description
Image ID	The system automatically obtains the ID of the image to be encrypted. You do not need to configure this parameter.
Custom Image Name	Enter a name for the new encrypted custom image. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Description	Enter a description for the new encrypted custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

Step 3: Use the encrypted custom image to create an instance

1.
2.
3.
4. Click **Create Instance**.
5. Configure the parameters for the instance.

   For more information about how to configure these parameters, see Create an instance

   In the **Image** section, set Image Type to **Custom Image**. Then, select the image that you encrypted from the **Custom Image** drop-down list.
6. Click **Submit**.

Result

After the instance is created, you can click its ID to go to the **Instance Details** page. Then, you can click the **Disks** tab and check the value in the **Disk Encryption** column corresponding to the system disk. If the value is **Yes**, the system disk is encrypted.

2.1.5.9.2. Encrypt a data disk

In the scenarios that require data security and regulatory compliance, you can encrypt disks to secure your data stored on the disks. After a data disk is created, you cannot change its encryption state. If you want to encrypt a data disk, enable encryption for the disk when you create it.

Context

We recommend that you determine the number and sizes of data disks before you create them. The following limits apply to data disks:

- A maximum of 16 data disks can be attached to an instance. Disks and Shared Block Storage devices share this quota.
- Each Shared Block Storage device can be attached to up to four ECS instances at the same time.
- Each ultra disk, standard SSD, Ultra Shared Block Storage device, or SSD Shared Block Storage device can have a maximum capacity of 32 TiB.
- Disks cannot be combined in ECS. They are independent of each other. You cannot combine multiple disks into one by formatting them.

We recommend that you do not use Logical Volume Manager (LVM) to create logical volumes across multiple disks, because a snapshot can back up data only of a single disk. If you create a logical volume across several disks, data discrepancies may occur when you restore these disks.

Procedure

1.
2.
3.
4. Click **Create Disk**.
5. On the **Create Disk** page, configure the parameters for the disk.

   When you encrypt the disk, take note of the following parameters:

   - **Encrypted**: Select **Yes**.
   - **Encryption Method**: Select an encryption algorithm.
     - **AES256**: indicates the AES256 encryption algorithm.
   - **Encryption Key**: Select an encryption key.

   For information about how to configure the other parameters to create a disk, see Create a disk.

6. Click **Submit**.

2.1.5.10. Re-initialize a disk

You can re-initialize disks to restore them to their initial states.

Prerequisites

- The disk to be re-initialized is in the **Running** state.
- The instance to which the disk is attached is in the **Stopped** state.
- After a disk is re-initialized, the data stored on the disk is lost and cannot be recovered. Exercise caution when you perform this operation. We recommend that you back up disk data or create snapshots before you re-initialize a disk. For more information, see Create a snapshot.

Context

The result of disk re-initialization depends on the disk type and how the disk was created.

- System disk:
  - The disk is restored to the initial state of the image from which the disk was created.
  - If the corresponding image has been deleted, the disk cannot be re-initialized.
- Data disk:
  - If the disk is empty when created, the disk is restored to an empty disk.
  - If the disk was created from a snapshot, the disk is restored to the state of the snapshot.
  - If the snapshot from which a disk was created has been deleted, the disk cannot be re-initialized.

Procedure

1.
2.
3.
4. Find the data disk that you want to re-initialize and click **Re-initialize** in the **Actions** column.
5. In the Re-initialize Disk dialog box, perform operations based on the disk type.
   - For a system disk, enter and confirm a new instance logon password. Select or clear Instance After Re-initializing Disk, and click **OK**.

     The password must be 8 to 30 characters in length, and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The supported special characters include `( ) ' ~ ! @#$%^&*-_+=|{}[]:;'<>,.? /`
   - For a data disk, click **OK**.

Result

When the disk is being re-initialized, the disk is in the **Initializing** state. After the disk is re-initialized, it enters the **Running** state.

2.1.5.11. Detach a data disk

You can detach data disks but cannot detach system disks.

Prerequisites

- Before you can detach a data disk from a Windows instance, you must bring the data disk offline by using Disk Management.

> **Note** To avoid data loss and ensure data integrity, we recommend that you stop read and write operations on the disk before you detach it.

- Before you can detach a data disk from a Linux instance, you must connect to the instance and unmount all partitions on the disk.

  > **Note** If you have added an entry in the */etc/fstab* file for the disk partitions to be automatically mounted on instance startup, you must delete the entry from the */etc/fstab* file before you detach the disk. Otherwise, you are unable to connect to the instance after the instance is restarted.

- The data disk that you want to detach is in the **Running** state.

Procedure

1.
2.
3.
4. Find the data disk that you want to detach and choose **More** > **Detach** in the **Actions** column.
5. Click **OK**.

2.1.5.12. Release a data disk

You can release data disks that are no longer needed. Released disks cannot be recovered. Exercise caution when you release data disks.

Prerequisites

The data disk to be released is in the **Pending** state. If the data disk is attached to an instance, you must detach the disk from the instance before you can release the disk.

Procedure

1.
2.
3.
4. Find the disk that you want to release and choose **More** > **Release** from the **Actions** column.
5. Click **OK**.

2.1.6. Images

2.1.6.1. Create a custom image

You can create a custom image and use it to create identical instances or replace the system disks of existing instances. This way, you can quickly obtain multiple instances with the same operating system and data environment.

Create a custom image from a snapshot

You can create a custom image from a system disk snapshot to load the operating system and data environment of the snapshot to the image. Before you perform this operation, make sure that a system disk snapshot is used. You cannot create custom images from data disk snapshots.

1.
2.

3.
4. Find the snapshot from which you want to create a custom image and click **Create Custom Image** in the **Actions** column.
5. Configure the parameters listed in the following table to create a custom image.

Parameter	Description
Custom Image Name	Enter a name for the custom image. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter.
Sharing Scope	Select the scope in which to share the custom image. ○ **Current Organization and Subordinate Organizations** ○ **Current Resource Set** ○ **Current Organization**
Description	Enter a description for the custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

6. Click **OK**.

Create a custom image from an instance

You can create a custom image from an instance to replicate the data of all disks of the instance, including the system disk and data disks.

> **Note** To avoid data security risks, we recommend that you delete sensitive data from an instance before you use the instance to create a custom image.

When you create a custom image from an instance, a snapshot is automatically generated for each disk on the instance, and all the snapshots constitute a complete custom image.

1.
2.
3.
4. Find the instance from which you want to create a custom image and choose **More > Create Custom Image** in the **Actions** column.
5. Configure the parameters listed in the following table to create a custom image.

Parameter	Description
Custom Image Name	Enter a name for the custom image. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), and colons (:). It must start with a letter.

Parameter	Description
Sharing Scope	Select the scope in which to share the custom image. ○ **Current Organization and Subordinate Organizations** ○ **Current Resource Set** ○ **Current Organization**
Description	Enter a description for the custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

6. Click **OK**.

2.1.6.2. View images

You can view a list of images.

Procedure

1.
2.
3.
4. Select a tab based on the type of images that you want to view.

   You can select the **Custom Images** or **Public Images** tab.
5. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Image Name	Enter an image name to search for the image.
Image ID	Enter an image ID to search for the image.
Snapshot ID	Enter a snapshot ID to search for images associated with the snapshot. This option is not available for public images.

2.1.6.3. View instances related to an image

You can view the instances that use a specified image.

Procedure

1.
2.
3.
4. Select a tab based on the type of the image that you want to view.

   You can select the **Custom Images** or **Public Images** tab.
5. Find the image and click **Related Instances** in the **Actions** column.

Result

The Instances page appears and shows the instances that use the image. You can perform operations on these instances, such as updating the image.

2.1.6.4. Modify the description of a custom image

You can modify the descriptions of created custom images.

Procedure

1.
2.
3.
4. Find the custom image that you want to modify and click **Modify Description** in the **Actions** column.
5. In the Modify Description dialog box, modify the image description in the Basic Settings field.

   The description must be 2 to 256 characters in length and cannot start with http:// or https://.
6. Click **OK**.

2.1.6.5. Share a custom image

You can share a created custom image to the organizations that you manage. Then, the organizations can use the shared image to create multiple instances that have identical environments.

Context

Only custom images can be shared. Shared images do not count against the image quotas of the organizations to which the images are shared.

The organizations to which images are shared can use the shared images to create instances or replace the system disks of existing instances.

You can delete shared images. After a shared image is deleted, the image is no longer visible to the organizations to which the image was shared and the system disks of the instances created from this image can no longer be re-initialized.

Procedure

1.
2.
3.
4. Find the image that you want to share and click **Share Image** in the **Actions** column.
5. In the Share Image dialog box, select a department from the **Department** drop-down list.

   > **Note** If no department list is available due to lack of permissions, you can enter the name of a level-1 organization in the Department field to share the image.
6. Click **OK**.

2.1.6.6. Encrypt a custom image

This topic describes how to encrypt a custom image to generate a new identical encrypted custom image.

Prerequisites

The custom image that you want to encrypt is in the Available (Available) state.

Context

To meet the requirements for data security compliance, you can use encrypted custom images to create instances. The system disks of the created instances are automatically encrypted.

Procedure

1.
2.
3.
4. Click the **Custom Images** tab.
5. Find the custom image that you want to encrypt and click **Encrypt Image** in the **Actions** column.
6. In the **Encrypt Image** dialog box, configure the parameters listed in the following table.

Parameter	Description
Image ID	The system automatically obtains the ID of the image to be encrypted. You do not need to configure this parameter.
Custom Image Name	Enter a name for the new encrypted custom image. The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Description	Enter a description for the new encrypted custom image. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

Result

After you encrypt the custom image, a new identical encrypted custom image is generated and displayed on the Custom Images tab.

2.1.6.7. Import custom images

2.1.6.7.1. Limits on importing images

This topic describes the limits on importing images. You must understand the limits to ensure that the imported images are available and make the import operation more efficient.

When you import images, take note of the limits described in the following sections:

- Linux images
- Windows images

Linux images

When you import Linux images, take note of the following limits:

- Multiple network interfaces are not supported.
- IPv6 addresses are not supported.
- Each password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Firewalls must be disabled. By default, port 22 is enabled.

- Each Linux system disk must range from 40 GiB to 500 GiB in size.
- DHCP must be enabled in the images.
- SELinux must be disabled.
- The Kernel-based Virtual Machine (KVM) driver must be installed.
- We recommend that you install cloud-init to configure hostnames, NTP sources, and YUM sources.

Limits

Item	Standard operating system image	Non-standard operating system image
Definition	The supported standard 32-bit and 64-bit operating systems include: • CentOS • Ubuntu • SUSE • openSUSE • RedHat • Debian • CoreOS • Aliyun Linux **Note** Support for standard operating systems may be subject to version changes. You can log on to the ECS console to view the latest supported operating systems.	Non-standard operating systems include: • Operating systems that are not supported by Alibaba Cloud • Standard operating systems that do not meet the requirements on critical system configuration files, basic system environments, or applications To use non-standard operating system images, select Others Linux when you import images. If the images that you import are non-standard operating system images, Alibaba Cloud does not process the instances created from these images. After you create an instance from a non-standard operating system image, you must connect to the instance by using the VNC feature in the ECS console, and then configure the IP address, route, and password of the instance.
Critical system configuration file	• Do not modify `/etc/issue*`. Otherwise, the version of the operating system cannot be identified, which leads to a failure to create the system. • Do not modify `/boot/grub/menu.lst`. Otherwise, the system fails to start. • Do not modify `/etc/fstab`. Otherwise, partitions cannot be loaded, which causes the system to fail to start. • Do not change `/etc/shadow` to read-only. Otherwise, the password file cannot be modified, which leads to a failure to create the system. • Do not modify `/etc/selinux/config` to enable SELinux. Otherwise, the system fails to start.	

Item	Standard operating system image	Non-standard operating system image
Basic system environment	• Do not adjust the system disk partitions. Only disks with a single root partition are supported. • Make sure that the system disk has sufficient free space. • Do not modify critical system files such as `/sbin`, `/bin`, and `/lib*`. • Before you import an image, confirm the integrity of the file system. • Only ext3 and ext4 file systems are supported.	Requirements for standard operating system images are not met.
Application	Do not install `qemu-ga` on a custom image. Otherwise, some of the services that Alibaba Cloud uses may be unavailable.	
Image file format	Only images in the RAW, VHD, or QCOW2 format can be imported. To import images in other formats, use a tool to convert the images to a supported format. We recommend that you import images in the VHD format, which has a smaller transmission footprint.	
Image file size	We recommend that you configure the system disk size based on the virtual disk size rather than the image size. The configured system disk size must be at least 40 GiB.	

Windows images

When you import Windows images, take note of the following limits:

- Each password must be 8 to 30 characters in length. It must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
- Imported Windows images do not provide the Windows Activation Service.
- Firewalls must be disabled. Otherwise, remote logon is not supported. Port 3389 must be enabled.
- Each Windows system disk must range from 40 GiB to 500 GiB in size.

Limits

Item	Description

Item	Description

Operating system version	Alibaba Cloud allows you to import the following 32-bit and 64-bit versions of Windows operating system images:
	• Microsoft Windows Server 2016
	• Microsoft Windows Server 2012, including:
	  ◦ Microsoft Windows Server 2012 R2 (Standard Edition)
	  ◦ Microsoft Windows Server 2012 (Standard Edition and Datacenter Edition)
	• Microsoft Windows Server 2008, including:
	  ◦ Microsoft Windows Server 2008 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	  ◦ Microsoft Windows Server 2008 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	• Microsoft Windows Server 2003, including:
	  ◦ Microsoft Windows Server 2003 R2 (Standard Edition, Datacenter Edition, and Enterprise Edition)
	  ◦ Microsoft Windows Server 2003 (Standard Edition, Datacenter Edition, and Enterprise Edition) or later, including Service Pack 1 (SP1)
	• Microsoft Windows 7, including:
	  ◦ Microsoft Windows 7 (Professional Edition)
	  ◦ Microsoft Windows 7 (Enterprise Edition)
	Note Support for standard operating systems may be subject to version changes. You can log on to the ECS console to view the latest supported operating systems.

Basic system environment	• Multi-partition system disks are supported. • Make sure that the system disk has sufficient free space. • Do not modify critical system files. • Before you import an image, confirm the integrity of the file system. • Disks can be partitioned in the MBR format and formatted to NTFS file systems.
Application	Do not install qemu-ga on an imported image. Otherwise, some of the services that Alibaba Cloud uses may be unavailable.
Supported image file format	• RAW • VHD • QCOW2 We recommend that you configure the system disk size based on the virtual disk size rather than the image size. The configured system disk size must range from 40 GiB to 500 GiB. **Note** We recommend that you import images in the VHD format, which has a smaller transmission footprint.

2.1.6.7.2. Convert the image file format

You can only import image files in the RAW, VHD, and qcow2 formats to ECS. If you want to import images in other formats, you must convert the image into a supported format. This topic describes how to convert the image format in Windows and Linux.

Context

You can use the qemu-img tool to convert an image from VMDK, VDI, VHDX, qcow1, or QED to RAW, VHD, or qcow2, or implement conversion between RAW, VHD, and qcow2.

> **Note** We recommend that you use the qcow2 format if your application environment supports this format.

Windows

1. Download qemu.

   Visit QEMU Binaries for Windows (64 bit) to download the qemu tool. Select a qemu version based on your operating system.

2. Install qemu.

   The installation path in this example is *C:\Program Files\qemu*.

3. Configure the environment variables for qemu.

   i. Choose **Start > Computer**, right-click Computer, and choose **Properties** from the shortcut menu.

   ii. In the left-side navigation pane, click **Advanced System Settings**.

   iii. In the **System Properties** dialog box that appears, click the **Advanced** tab and then click **Environment Variables**.

   iv. In the **Environment Variables** dialog box that appears, find the **Path** variable from the **System variables** section.

   - If the **Path** variable exists, click **Edit**.
   - If the **Path** variable does not exist, click **New**.

   v. Add a system variable value.

   - In the Edit System Variable dialog box that appears, add *C:\Program Files\qemu* to the **Variable value** field, separate different variable values with semicolons (;), and then click **OK**.
   - In the New System Variable dialog box that appears, enter *Path* in the **Variable name** field, enter *C:\Program Files\qemu* in the **Variable value** field, and then click **OK**.

4. Open Command Prompt in Windows and run the `qemu-img --help` command. If a successful response is displayed, the tool is installed.

5. In the Command Prompt window, run the `cd [Directory of the source image file]` command to switch to a new file directory,

   for example, `cd D:\ConvertImage`.

6. In the Command Prompt window, run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format.

   The parameters are described as follows:

   - The `-f` parameter is followed by the source image format.
   - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

   After the conversion is complete, the destination file appears in the directory of the source image file.

Linux

1. Install the qemu-img tool.
   - For Ubuntu, run the `apt install qemu-img` command.
   - For CentOS, run the `yum install qemu-img` command.
2. Run the `qemu-img convert -f raw -O qcow2 centos.raw centos.qcow2` command to convert the image file format.

   The parameters are described as follows:
   - The `-f` parameter is followed by the source image format.
   - The `-O` parameter (case-sensitive) is followed by the destination image format, source file name, and destination file name.

2.1.6.7.3. Import an image

After you upload a local image to an Object Storage Service (OSS) bucket, you can import the image as a custom image to Elastic Compute Service (ECS).

Prerequisites

- An image is made. It meets the limits and requirements for image import and is in the RAW, VHD, or QCOW2 format. For more information, see Limits on importing custom images and Convert the image file format.
- You are authorized to import images. For more information, see the "RAM" chapter in *Apsara Uni-manager Management Console User Guide*.
- A local image is uploaded to a bucket by using the OSS console or by calling an OSS API operation. For more information, see the "Upload objects" topic in *OSS User Guide* or the "PutObject" topic in *OSS Developer Guide*.

> **Note** Make sure that the bucket resides in the region to which you want to import the image as a custom image.

Procedure

1.
2.
3.
4. Click **Import Image**.
5. Configure the parameters described in the following table.

Parameter	Required	Description
Region	Yes	The region to which to import the image as a custom image.
Organization	Yes	The organization in which to use the custom image.
Resource Set	Yes	The resource set to which to assign the custom image.
OSS Bucket Name	Yes	The name of the OSS bucket where the image to be imported is stored.
OSS Object Name	Yes	The URL of the object as which the image to be imported is stored in the OSS bucket. For information about how to obtain the URL of an OSS object, see the "Obtain object URLs" topic in *OSS User Guide*.

Parameter	Required	Description
Image Name	Yes	The name of the custom image. The name must be 2 to 128 characters in length. It must start with a letter and can contain letters, periods (.), underscores (_), and hyphens (-).
Sharing Scope	Yes	The scope in which to share the custom image. ○ **Current Organization and Subordinate Organizations** ○ **Current Resource Set** ○ **Current Organization**
Operating system	Yes	Valid values: **Linux** and **Windows**.
System Disk (GiB)	Yes	The size of the system disk on an instance. Unit: GiB.
System Architecture	Yes	Valid values: **x86_64** and **i386**.
Platform	Yes	Linux: ○ **CentOS** ○ **Ubuntu** ○ **SUSE** ○ **OpenSUSE** ○ **Debian** ○ **CoreOS** ○ **Aliyun** ○ **Others Linux** ○ **Customized Linux** Windows: ○ **Windows Server 2003** ○ **Windows Server 2008** ○ **Windows Server 2012**
Description	No	The description of the custom image.
Add Data Disk Image	No	Imports another image that contains data from data disks. If you select Add Data Disk Image, you must specify parameters including OSS Object Address, Image Format, Device Name, and Disk Capacity.

6. Click **OK**.

Result

You can go to the Images page to view the creation progress of the custom image. For more information, see View images. When the custom image is created, 100% is displayed in the Progress column.

2.1.6.8. Export a custom image

You can export custom images to OSS buckets and then download the images to your local device.

Prerequisites

- OSS is activated and an OSS bucket is created. For more information, see the "Create buckets" topic in *OSS User Guide*.
- You are authorized to export images. For more information, see the "RAM" chapter in *Apsara Uni-manager Management Console User Guide*.

Context

You can export custom images to the RAW, VHD, or QCOW2 format. After a custom image is exported to an OSS bucket, you can download the image to your local device. For more information, see the "Obtain object URLs" topic in *OSS User Guide*.

Procedure

1.
2.
3.
4. Find the custom image that you want to export and click **Export Image** in the **Actions** column.
5. Configure the parameters listed in the following table.

Parameter	Required	Description
OssBucket	Yes	The name of the OSS bucket where to store the exported image.
Image Type	No	The format in which to export the image. Valid values: **RAW**, **VHD**, and **QCOW2**.
OSS Prefix	No	The prefix of the OSS object to which to export the image. must be 1 to 30 characters in length and can contain digits and letters.

6. Click **OK**.

2.1.6.9. Delete a custom image

You can delete custom images that are no longer needed. Custom images can be deleted but public images cannot.

Procedure

1.
2.
3.
4. Use one of the following methods to delete custom images:
   - To delete a single custom image, find the image and click **Delete Image** in the **Actions** column.
   - To delete one or more custom images at a time, select the images and click **Delete** in the lower-left corner of the image list.
5. Click **OK**.

2.1.7. Snapshots

2.1.7.1. Create a snapshot

You can manually create snapshots for disks to back up disk data.

Prerequisites

- The associated instance of the disk for which you want to create a snapshot is in the **Running** or **Stopped** state.
- The disk is in the **Running** state.

Context

Up to 64 snapshots can be retained for each disk.

Snapshots can be used in the following scenarios:

- Roll back data on disks

  For more information, see Restore a disk.

- Create a custom image

  For more information, see Create a custom image from a snapshot. Data disk snapshots cannot be used to create custom images.

- Create a data disk from a data disk snapshot

  To create a data disk from a snapshot, set Use Snapshot to Yes and then specify a snapshot on the Create Disk page. For more information, see Create a disk. The created disk size is determined by the size of the specified snapshot and cannot be changed. When you re-initialize a data disk created from a snapshot, the disk is restored to the state of the snapshot.

When you create a snapshot, take note of the following items:

- For each disk, the first snapshot is a full snapshot and subsequent snapshots are incremental snapshots. It takes longer to create the first snapshot. The amount of time it takes to create an incremental snapshot depends on the volume of data that has been changed since the last snapshot. The more data that has changed, the longer it takes.

  > **Note** If you want to use a snapshot immediately after it is created, you can enable the instant access feature.

- We recommend that you create snapshots during off-peak hours.

Procedure

1.
2.
3.
4. On the Disks page, find the disk for which you want to create a snapshot and click **Create Snapshot** in the **Actions** column.
5. Enter a snapshot name and description and then click **OK**.

Parameter	Description
Snapshot Name	The name of the snapshot. **Note** The name cannot start with auto because snapshots whose names start with auto are recognized as automatic snapshots.

Parameter	Description
Instant Access	Specifies whether to enable the instant access feature. After you enable the instance access feature for a snapshot, you can immediately use the snapshot to perform operations such as rolling back the disk.
Description	The description of the snapshot.

You can go to the Snapshots page to check the creation progress of the snapshot. For more information, see View snapshots. When the snapshot is created, 100% is displayed in the Progress column.

2.1.7.2. View snapshots

You can view the list of snapshots.

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Snapshot Name	Enter a snapshot name to search for the snapshot.
Snapshot ID	Enter a snapshot ID to search for the snapshot.
Instance ID	Enter an instance ID to search for snapshots related to the instance.
Disk ID	Enter a disk ID to search for snapshots related to the disk.
Snapshot Type	Select a snapshot type to search for snapshots of that type. Valid values: ◦ **All** ◦ **User Snapshots**: manual snapshots ◦ **Automatic Snapshots**: automatic snapshots
Creation Time	Enter a time to search for snapshots that were created at that time.

2.1.7.3. Delete a snapshot

You can delete snapshots that are no longer needed. Deleted snapshots cannot be recovered. You cannot delete system disk snapshots that have been used to create custom images.

Procedure

1.
2.
3.
4. Use one of the following methods to delete snapshots:

- To delete a single snapshot, find the snapshot and click **Delete** in the **Actions** column.
- To delete one or more snapshots at a time, select the snapshots and click **Delete** in the lower-left corner of the Snapshots page.

5. Click **OK**.

2.1.8. Automatic snapshot policies

2.1.8.1. Create an automatic snapshot policy

Automatic snapshot policies can be applied to system disks and data disks to create periodical snapshots of the disks. You can use automatic snapshot policies to improve data security and tolerance against operation faults.

Context

Automatic snapshot policies can effectively eliminate the following risks associated with manual snapshots:

- When applications such as personal websites or databases deployed on an ECS instance encounter attacks or system vulnerabilities, you may be unable to manually create snapshots. In this case, you can use the latest automatic snapshots to roll back the affected disks to restore your data and reduce loss.
- You can also specify an automatic snapshot policy to create snapshots before regular system maintenance tasks are performed. This eliminates the need to manually create snapshots and ensures that snapshots are always created before maintenance.

You can retain up to 64 snapshots for each disk. If the maximum number of snapshots for a disk is reached while a new snapshot is being created, the system deletes the oldest automatic snapshot.

Procedure

1.
2.
3.
4. Click **Create Policy**.
5. Configure the parameters listed in the following table to create an automatic snapshot policy.

Parameter	Required	Description
Region	Yes	The ID of the region in which to apply the automatic snapshot policy.
Organization	Yes	The organization in which to apply the automatic snapshot policy.
Resource Set	Yes	The resource set in which to apply the automatic snapshot policy.
Policy Name	Yes	The name of the automatic snapshot policy. The name must be 2 to 128 characters in length and cannot start with a special character or digit. It can contain periods (.), underscores (_), hyphens (-), and colons (:).

Parameter	Required	Description
Creation Time	Yes	The time of the day at which to create an automatic snapshot. Valid values: 00:00 to 23:00 (the start of each hour). You can select multiple values. **Note** The default time zone for the snapshot policy is UTC+8. You can change the time zone to suit your business requirements. If the time scheduled for creating an automatic snapshot is due while a previous automatic snapshot is being created, the new snapshot creation task is skipped. This may occur when a disk contains a large volume of data. For example, assume that an automatic snapshot policy is applied to a disk that contains a large volume of data, and the policy specifies to create snapshots at 00:00, 01:00, and 02:00. If the system starts to create a snapshot at 00:00 and takes 70 minutes to complete the snapshot creation task, the system skips the automatic snapshot task scheduled for 01:00 and creates the next automatic snapshot at 02:00.
Frequency	Yes	The day of the week when to create automatic snapshots. The valid values range from Monday to Sunday. You can select multiple values.
Retention Policy	No	The retention period of the automatic snapshots. The default value is Keep for 30 Days. You can select one of the following options: ◦ **Keep for**: You can select this option and then specify the number of days during which to retain the automatic snapshots. Valid values: 1 to 65536. ◦ **Always Keep the Snapshots Until the Number of Snapshots Reaches the Upper Limit**: You can select this option to retain the automatic snapshots until the maximum number of snapshots is reached.

6. Click **OK**.

What's next

After the automatic snapshot policy is created, you must apply it to a disk for snapshots to be automatically created. For more information, see Configure an automatic snapshot policy for multiple disks.

2.1.8.2. View automatic snapshot policies

You can view the list of automatic snapshot policies.

Procedure

1.
2.
3.
4. View the list of automatic snapshot policies.

2.1.8.3. Modify an automatic snapshot policy

You can modify the attributes of automatic snapshot policies. The attributes of each automatic snapshot policy that can be modified include the name, creation time, frequency, and retention policy.

Procedure

1.
2.
3.
4. Find the automatic snapshot policy that you want to modify and click **Modify Policy** in the **Actions** column.
5. Modify the attributes of the policy.

   Changes made to the retention policy do not affect existing snapshots but take effect only on subsequent snapshots.
6. Click **OK**.

2.1.8.4. Configure an automatic snapshot policy

After you apply an automatic snapshot policy to a disk, snapshots will be created automatically for the disk based on the policy settings. You can cancel an applied automatic snapshot policy at any time.

Context

We recommend that you configure the automatic snapshot policy to create automatic snapshots during off-peak hours. You can also manually create a snapshot for the disk that already has an automatic snapshot policy applied. When an automatic snapshot is being created, you must wait until the snapshot is complete before you can create a manual snapshot. The automatic snapshot is named in the following format: auto_yyyyMMdd_1, such as auto_20140418_1.

Procedure

1.
2.
3.
4. Find the disk and click **Configure Automatic Snapshot Policy** in the **Actions** column.
5. Select a procedure based on the operation you want to perform on the policy.
   - To apply an automatic snapshot policy, turn on **Automatic Snapshot Policy**, select a policy, and then click **OK**.
   - To cancel an automatic snapshot policy, turn off **Automatic Snapshot Policy** and click **OK**.

2.1.8.5. Configure an automatic snapshot policy for multiple disks

After you apply automatic snapshot policies to disks, snapshots are created automatically for the disks based on the policies. You can disable applied automatic snapshot policies at any time.

Context

We recommend that you configure automatic snapshot policies to create automatic snapshots during off-peak hours. You can manually create snapshots for disks that already have automatic snapshot policies applied. When an automatic snapshot is being created for a disk, you must wait for the snapshot to be complete before you can create a manual snapshot for the disk. Each automatic snapshot is named in the following format:

auto_yyyyMMdd_1. Example: auto_20140418_1.

Procedure

1.
2.
3.
4. Find the automatic snapshot policy that you want to configure and click **Apply Policy** in the **Actions** column.
5. Apply the policy to disks or disable the policy for disks.
   - To apply the automatic snapshot policy, select the **Disks Without Policy Applied** tab, select one or more disks, and then click **Apply Policy** in the lower part of the tab.
   - To disable the automatic snapshot policy, select the **Disks With Policy Applied** tab, select one or more disks, and then click **Disable Policy** in the lower part of the tab.

2.1.8.6. Delete an automatic snapshot policy

You can delete automatic snapshot policies that are no longer needed. After you delete an automatic snapshot policy, the policy is automatically canceled for the disks that have it applied.

Procedure

1.
2.
3.
4. Find the automatic snapshot policy that you want to delete and click **Delete Policy** in the **Actions** column.
5. Click **OK**.

2.1.9. Security groups

2.1.9.1. Create a security group

Security groups are an important means for network security isolation. They implement network access control for one or more ECS instances.

Prerequisites

A virtual compute cloud (VPC) is created. For more information, see *VPC User Guide*.

Context

Security groups determine whether the instances in the same account that are deployed within the same VPC and region can communicate with each other. By default, if the instances belong to the same security group, they can communicate with each other over the internal network. If the instances belong to different security groups, you can authorize mutual access between the security groups to allow the instances to communicate with each other over the internal network.

Procedure

1.
2.
3.
4. Click **Create Security Group**.
5. Configure the parameters listed in the following table to create a security group.

Type	Parameter	Required	Description
Region	Organization	Yes	Select an organization in which to create the security group. Make sure that the security group and the VPC belong to the same organization.
	Resource Set	Yes	Select a resource set in which to create the security group. Make sure that the security group and the VPC belong to the same resource set.
	Region	Yes	Select a region in which to create the security group. Make sure that the security group and VPC belong to the same region.
	Zone	Yes	Select a zone in which to create the security group.
Basic Settings	VPC	Yes	Select a VPC in which to create the security group.
	Security Group Name	No	Enter a name for the security group. The name must be 2 to 128 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It cannot start with http:// or https://.
	Description	No	Enter a description for the security group. To simplify future management operations, we recommend that you provide an informational description. The description must be 2 to 256 characters in length and start with a letter. It can contain letters, digits, periods (.), underscores (_), hyphens (-), and commas (,). It cannot start with http:// or https://.

6. Click **Submit**.

2.1.9.2. View security groups

You can view the list of security groups.

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Security Group ID	Enter a security group ID to search for the security group.
Security Group Name	Enter a security group name to search for the security group.
VPC ID	Enter a VPC ID to search for security groups that belong to the VPC.

2.1.9.3. Modify a security group

You can modify the names and descriptions of created security groups.

Procedure

1.
2.
3.
4. Find the security group that you want to modify and click **Modify** in the **Actions** column.
5. Modify the name and description of the security group.
6. Click **OK**.

2.1.9.4. Add a security group rule

You can use security group rules to control access to and from the ECS instances in a security group over the Internet and the internal network.

Procedure

1.
2.
3.
4. Find the security group to which you want to add a rule and click **Rules** in the **Actions** column.
5. Click **Create Rule**.
6. Configure the parameters listed in the following table to create a security group rule.

Parameter	Required	Description
ENI Type	Yes	Valid value: **Internal Network ENI**. In VPCs, you cannot find public NICs in ECS instances and can add only internal security group rules. However, the added security group rules apply to both the Internet and the internal network.
Direction	Yes	◦ **Outbound**: access from the ECS instances in the current security group to other ECS instances on the internal network or to resources on the Internet. ◦ **Inbound**: access from other ECS instances on the internal network or from resources on the Internet to the ECS instances in the current security group.
Action	Yes	◦ **Allow**: allows access requests on specified ports. ◦ **Deny**: discards requests received on specified ports without returning messages. If two security group rules are different only in the Action parameter, the **Deny** rule takes effect whereas the **Allow** rule is ignored.

Parameter	Required	Description
Protocol	Yes	◦ **All**: This value can be used in total trust scenarios. ◦ **TCP**: This value can be used to allow or deny traffic on one or several successive ports. ◦ **UDP**: This can be used to allow or deny traffic on one or several successive ports. ◦ **ICMP**: This value can be used when the `ping` command is used to test the status of the network connection between instances. ◦ **ICMPv6**: This value can be used when the `ping6` command is used to test the status of the network connection between instances. ◦ **GRE**: This value can be used for VPN.
Port Range	Yes	The port range depends on the protocol type. ◦ When you set Protocol to **ALL**, the value of **-1/-1** is displayed, which indicates all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **TCP**, you can specify a port range in the <start port number>/<end port number> format. Valid port numbers: 1 to 65535. You can set the start port number and end port number to the same value to specify a single port. For example, use 22/22 to specify port 22. ◦ When you set Protocol to **UDP**, you can specify a port range in the <start port number>/<end port number> format. Valid port numbers: 1 to 65535. You can set the start port number and end port number to the same value to specify a single port. For example, use 3389/3389 to specify port 3389. ◦ When you set Protocol to **ICMP**, the value of **-1/-1** is displayed, which indicates all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **ICMPv6**, the value of **-1/-1** is displayed, which indicates all ports. You cannot specify a port range in this case. ◦ When you set Protocol to **GRE**, the value of **-1/-1** is displayed, which indicates all ports. You cannot specify a port range in this case.
Priority	Yes	The priority of the rule. Valid values: 1 to 100. The default value is 1, which indicates the highest priority.
Authorization Type	Yes	◦ **IPv4 Addresses**: IPv4 addresses or CIDR blocks. ◦ **IPv6 Addresses**: IPv6 addresses or CIDR blocks. ◦ **Security Groups**: security groups. This authorization type takes effect only on the internal network. You can select another security group in the current account as the authorization object for the instances in the current security group. This way, you can control the access to or from the ECS instances in that security group over the internal network.

Parameter	Required	Description
Authorization object	Yes	Authorization objects depend on the authorization type. When you set Authorization Type to **IPv4 Addresses**: ◦ Enter single IPv4 addresses or CIDR blocks. Example: *192.0.2.1* or *192.0.2.0/24*. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you enter *0.0.0.0/0*, all IPv4 addresses are allowed or denied based on the Action parameter. Exercise caution when you specify 0.0.0.0/0. When you set Authorization Type to **IPv6 Addresses**: ◦ Enter single IPv6 addresses or CIDR blocks. Example: *2001:db8:1:1:1:1:1:1* or *2001:db8::/32*. ◦ You can enter up to 10 authorization objects at a time. Separate multiple objects with commas (,). ◦ If you enter *::/0*, all IPv6 addresses are allowed or denied based on the Action parameter. Exercise caution when you specify ::/0. When you set Authorization Type to **Security Groups**, select a security group ID. If the current security group is of the VPC type, the selected security group must be in the same VPC as the current security group.
Description	No	The description of the security group rule. To simplify future management operations, we recommend that you provide an informational description. The description must be 2 to 256 characters in length and cannot start with http:// or https://.

7. Click **OK**.

2.1.9.5. Clone a security group rule

You can clone a security group rule to quickly create a similar rule.

Procedure

1.
2.
3.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Clone** in the **Actions** column.
7. In the **Clone Security Group Rule** dialog box, modify the attributes of the security group rule.

   For more information about the attributes of security group rules, see Add a security group rule.
8. Click **OK**.

2.1.9.6. Modify a security group rule

You can modify improper rules in a security group to ensure the security of ECS instances in the security group.

Procedure

1.

2.
3.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Find the target security group rule and click **Modify** in the **Actions** column.
7. In the **Modify Security Group Rule** dialog box, modify the attributes of the security group rule.

   For more information about the attributes of security group rules, see Add a security group rule.
8. Click **OK**.

2.1.9.7. Export security group rules

You can export security group rules of a security group to a local device for backup.

Procedure

1.
2.
3.
4. Find the target security group and click **Rules** in the **Actions** column.
5. On the Rules page that appears, click the **Inbound** or **Outbound** tab.
6. Click **Export** in the upper-right corner to download and save the rules to a local device.

2.1.9.8. Import security group rules

You can import a local backup file of security group rules into a security group to create or restore security group rules.

Context

You can first download a template file (Excel file), configure security group rules in the template file based on the template requirements, and then import the file.

Procedure

1.
2.
3.
4. On the Security Groups page, find the security group into which you want to import rules and click **Rules** in the **Actions** column.
5. Click **Import** in the upper-right corner.
6. In the **Import Rule** dialog box, click **Upload File**.
7. Select a local backup file of security group rules and click **Open**.

2.1.9.9. Add an instance to a security group

You can add an existing instance to a security group in the same region. After the instance is added, the rules of the security group automatically apply to the instance.

Procedure

1.

2.
3.
4. Find the security group to which you want to add an instance and click **Manage Instances** in the **Actions** column.
5. Click **Add Instance**.
6. Select an instance and click **OK**.

2.1.9.10. Remove instances from a security group

You can remove instances from security groups, but each of the instances must always belong to at least one security group.

Prerequisites

The instances to be removed belong to two or more security groups.

Context

After an instance is removed from a security group, the instance is isolated from the other instances in the security group. We recommend that you perform all tests in advance to ensure that services can continue to run properly after you remove the instance from the security group.

Procedure

1.
2.
3.
4. Find the security group from which you want to remove instances and click **Manage Instances** in the **Actions** column.
5. On the Instances page, select one or more instances and click **Remove** in the lower-left corner.
6. Click **OK**.

2.1.9.11. Delete a security group

You can delete security groups that are no longer needed.

Prerequisites

No instances exist in the security group that you want to delete.

Procedure

1.
2.
3.
4. Use one of the following methods to delete security groups:
   - To delete a single security group, find the security group and click **Delete** in the **Actions** column.
   - To delete one or more security groups at a time, select the security groups and click **Delete** in the lower-left corner of the Security Groups page.
5. Click **OK**.

2.1.10. Elastic Network Interfaces

2.1.10.1. Create an ENI

You can bind elastic network interfaces (ENIs) to instances to create high-availability clusters and implement fine-grained network management. You can also unbind an ENI from an instance and then bind the ENI to another instance to implement a low-cost failover solution.

Prerequisites

- A virtual private cloud (VPC) and a VSwitch are created. For more information, see Create a VPC and Create a VSwitch in *Apsara Stack VPC User Guide* .
- A security group is available in the VPC. If no security group is available in the VPC, create a security group. For more information, see Create a security group.

Context

ENIs are classified into primary and secondary ENIs.

A primary ENI is created by default when an instance is created in a VPC. This primary ENI has the same lifecycle as the instance and cannot be unbound from the instance.

ENIs created separately are secondary ENIs. You can bind secondary ENIs to or unbind them from instances. This topic describes how to create a secondary ENI.

Procedure

1.
2.
3.
4. Click **Create ENI**.
5. Configure parameters listed in the following table to create an ENI.

Section	Parameter	Required	Description
Region	Organization	Yes	The organization in which to create the ENI.
	Resource Set	Yes	The resource set in which to create the ENI.
	Region	Yes	The region in which to create the ENI.
	Zone	Yes	The zone in which to create the ENI.

Section	Parameter	Required	Description
Basic Settings	VPC	Yes	The VPC in which to create the ENI. The secondary ENI can be bound only to an instance in the same VPC. **Note** After the ENI is created, you cannot change its VPC.
	VSwitch	Yes	The VSwitch to be associated with the ENI. The secondary ENI can be bound only to an instance in the same VPC. Select a VSwitch that is in the same zone as the instance to which the ENI will be bound. The VSwitch of the ENI can be different from that of the instance. **Note** After an ENI is created, you cannot change its VSwitch.
	Security Group	Yes	The security group in which to create the ENI within the specified VPC. The rules of the security group automatically apply to the ENI.
	ENI Name	Yes	The name of the ENI. The name must be 2 to 128 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).

Section	Parameter	Required	Description
	Description	No	The description of the ENI. We recommend that you provide an informational description to simplify future management operations. The description must be 2 to 256 characters in length. It must start with a letter and cannot start with http:// or https://. It can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,).
	Primary Private IP	No	The primary private IPv4 address of the ENI. The IPv4 address must be within the CIDR block of the specified VSwitch. If you do not specify a primary private IP address, the system automatically assigns a private IP address to the ENI.

6. Click **Submit**.

Result

The created ENI is displayed on the ENIs page and is in the **Available** state.

2.1.10.2. View ENIs

You can view the list of ENIs.

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
ENI Name	Enter an ENI name to search for the ENI.
ENI ID	Enter an ENI ID to search for the ENI.
VSwitch ID	Enter a vSwitch ID to search for ENIs that are associated with the vSwitch.

Filter option	Description
Security Group ID	Enter a security group ID to search for ENIs that belong to the security group.
Instance ID	Enter an instance ID to search for ENIs that are bound to the instance.

2.1.10.3. Modify a secondary ENI

You can modify the attributes of a secondary elastic network interface (ENI), including the name, security group, and description.

Prerequisites

The secondary ENI is in the **Available** state.

Procedure

1.
2.
3.
4. Find the secondary ENI and click **Modify** in the **Actions** column.
5. In the Modify ENI dialog box that appears, modify the name, security group, and description of the ENI.
6. Click **OK**.

2.1.10.4. Bind a secondary ENI to an instance

You can bind a secondary elastic network interface (ENI) to an instance. After the ENI is bound, the instance can process the traffic on the ENI.

Prerequisites

- The secondary ENI that you want to bind is in the **Available** state.
- The instance to which you want to bind the secondary ENI is in the **Running** or **Stopped** state.
- The instance and the secondary ENI belong to the same virtual private cloud (VPC).
- The vSwitch with which the secondary ENI is associated is located within the same zone as the vSwitch to which the instance is connected. An ENI can be bound only to an instance within the same zone. The vSwitches of the ENI and of the instance can be different but must be located within the same zone.

Context

The following limits apply when you bind an ENI to an instance:

- Only secondary ENIs can be manually bound. Primary ENIs share the same lifecycle as instances and cannot be manually bound.
- An ENI can be bound only to a single instance at the same time. Each instance can have one or more bound ENIs. The maximum number of ENIs that can be bound to an instance is determined based on the instance type.

Bind a secondary ENI on the instance details page

To bind multiple secondary ENIs to an instance, you can go to the details page of the instance.

1.
2.
3.

4. Find the instance to which you want to bind a secondary ENI and click the instance ID.
5. Click the **ENIs** tab.
6. Click **Bind NIC**.
7. In the Bind NIC dialog box, select an ENI from the **ENI** drop-down list.
8. Click **OK**.

Bind a secondary ENI on the ENIs page

To bind secondary ENIs to multiple instances, you can go to the ENIs page.

1.
2.
3.
4. Find the secondary ENI that you want to bind and click **Bind** in the **Actions** column.
5. In the Bind dialog box, select an instance and click **OK**.
   In the **Status/Creation Time** column, the state of the secondary ENI changes to **Bound**.

2.1.10.5. Unbind a secondary ENI from an instance

You can unbind a secondary elastic network interface (ENI) from an instance. After the secondary ENI is unbound from the instance, the instance no longer processes the traffic on the ENI.

Prerequisites

- The secondary ENI is in the **Bound** state.
- The instance is in the **Running** or **Stopped** state.

Context

Only secondary ENIs can be unbound. Primary ENIs share the same lifecycle as instances and cannot be unbound.

Procedure

1.
2.
3.
4. Find the secondary ENI and click **Unbind** in the **Actions** column.
5. Click **OK**.

Result

In the **Status/Creation Time** column, the status of the secondary ENI changes to **Available**.

2.1.10.6. Delete a secondary ENI

You can delete a secondary elastic network interface (ENI) that is no longer needed.

Prerequisites

The secondary ENI is in the **Available** state.

Context

You can delete only secondary ENIs. Primary ENIs share the same lifecycle as instances and cannot be deleted.

Procedure

1.
2.
3.
4. Find the secondary ENI and click **Delete** in the **Actions** column.
5. Click **OK**.

2.1.11. Deployment sets

2.1.11.1. Create a deployment set

You can use deployment sets to distribute or aggregate instances involved in your business. You can select hosts, racks, or network switches to improve service availability or network performance.

Procedure

1.
2.
3.
4. Click **Create Deployment Set**.
5. Configure the parameters described in the following table.

Section	Parameter	Required	Description
Region	Organization	Yes	The organization in which to create the deployment set.
	Resource Set	Yes	The resource set in which to create the deployment set.
	Region	Yes	The region in which to create the deployment set.
	Zone	Yes	The zone in which to create the deployment set.
	Deployment Domain	Yes	This parameter determines the valid values of Deployment Granularity.
	Deployment Granularity	Yes	The basic unit that can be scheduled when you deploy instances. Valid values: ○ **Host**: Instances are distributed or aggregated at the host level. ○ **Rack**:Instances are distributed or aggregated at the rack level. ○ **Network Switch**: Instances are distributed or aggregated at the network switch level.

Section	Parameter	Required	Description
Basic Settings	Deployment Policy	No	The dispersion policies are used to improve service availability to avoid impacts on your business when a host, rack, or switch fails. The aggregation policies are used to improve network performance to minimize the access latency between instances. Valid values: ○ **Loose Dispersion** ○ **Strict Dispersion** ○ **Loose Aggregation** ○ **Strict Aggregation**
	Deployment Set Name	Yes	The name of the deployment set. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It must start with a letter and cannot start with http:// or https://.
	Description	No	The description of the deployment set. To simplify future management operations, we recommend that you provide an informational description. The description must be 2 to 256 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It must start with a letter and cannot start with http:// or https://.

6. Click **Submit**.

2.1.11.2. View deployment sets

You can view the list of deployment sets.

Procedure

1.
2.
3.
4. Select a filter option from the drop-down list, enter the relevant information in the search bar, and then click **Search**.

   You can select multiple filter options to narrow down search results.

Filter option	Description
Deployment Set Name	Enter a deployment set name to search for the deployment set.
Deployment Set ID	Enter a deployment set ID to search for the deployment set.

2.1.11.3. Modify a deployment set

You can modify the name and description of a deployment set.

Procedure

1.
2.
3.
4. Find the deployment set and click **Modify** in the **Actions** column.
5. In the Change Deployment Set dialog box, change the name of the deployment set.
6. Click **OK**.

2.1.11.4. Delete a deployment set

You can delete a deployment set that is no longer needed.

Prerequisites

No instances exist in the deployment set.

Procedure

1.
2.
3.
4. Find the deployment set and click **Delete** in the **Actions** column.
5. Click **OK**.

2.1.12. Dedicated hosts

2.1.12.1. Create a dedicated host

A dedicated host is a cloud host whose physical resources are reserved for the exclusive use of a single tenant. Elastic Compute Service (ECS) instances created on a dedicated host are physically isolated from those created on other hosts. This topic describes how to create a dedicated host.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Dedicated Hosts**.
3.
4. On the **Hosts** tab, click **Create Host**.
5. On the **Create Host** page, configure the parameters described in the following table.

Section	Parameter	Description
Basic Settings	Organization	The organization in which to create the dedicated host.
	Resource Set	The resource set in which to create the dedicated host.
Region and Zone	Region	The region in which to create the dedicated host.
	Zone	The zone in which to create the dedicated host.

Section	Parameter	Description
Instance	Dedicated Host Type	The type of the dedicated host. The dedicated host type determines the instance family and the maximum number of ECS instances that you can deploy on the dedicated host.
	DDH Name	The name of the dedicated host. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It must start with a letter and cannot start with http:// or https://.
	Quantity	The number of dedicated hosts that you want to create.
DDH Settings	Allow Automatic Deployment	Specify whether to add the dedicated host to the resource pool for automatic deployment. Valid values: ○ Allow ○ Not Allow
	Automatic Instance Migration upon DDH Failure	Specify whether to fail over the instances deployed on the dedicated host when it fails. Valid values: ○ Enable ○ Disable

6. Click **Submit**.

Result

After the dedicated host is created, you can view it in the Dedicated Host list and create instances on it. For more information about the parameters used to create an ECS instance, see Create an instance.

2.1.12.2. Create a host group

You can group dedicated hosts into host groups for easy management. This topic describes how to create a host group.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Dedicated Hosts**.
3.
4. Click the **Host Groups** tab.
5. Click **Create Host Group**.
6. On the **Create Host Group** page, configure the parameters described in the following table.

Section	Parameter	Required	Description
Basic Settings	Organization	Yes	The organization in which to create the host group.
	Resource Set	Yes	The resource set in which to create the host group.

Section	Parameter	Required	Description
Region and Zone	Region	Yes	The region in which to create the host group.
	Zone	Yes	The zone in which to create the host group.
Instance	Host Group Name	No	The name of the host group. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), hyphens (-), colons (:), and commas (,). It must start with a letter and cannot start with http:// or https://.

7. Click **Submit**.

Result

After the host group is created, you can view it in the host group list.

2.1.12.3. Add dedicated hosts to a host group

After you create a host group, you can add dedicated hosts to the host group for easy management. This topic describes how to add dedicated hosts to a host group.

Procedure

1. Log on to the ECS console.
2. In the left-side navigation pane, click **Dedicated Hosts**.
3.
4. Click the **Host Groups** tab.
5. Find the host group to which you want to add dedicated hosts and click **Add Host** in the **Actions** column.
6. In the **Add Host** panel, select a dedicated host and click **Add Host**.

   To add a new dedicated host, you can click **Create Host** in the **Add Host** panel. For information about the parameters used to create a host, see Create a dedicated host. After the host is created, add it to the host group.

Result

After the dedicated host is added to the host group, you can click the host group name to view the dedicated host in the **Hosts** list.

2.1.13. Install FTP software

2.1.13.1. Overview

File Transfer Protocol (FTP) transfers files between a client and a server by establishing two TCP connections. One is the command link for transferring commands between a client and a server. The other is the data link used to upload or download data. Before uploading files to an instance, you must build an FTP site for the instance.

2.1.13.2. Install and configure vsftp in CentOS

This topic describes how to install and configure vsftp in CentOS to transfer files.

Procedure

1. Install vsftp.

```
yum install vsftpd -y
```

2. Add an FTP account and a directory.
   i. Check the location of the *nologin* file,

      which is usually under the */usr/sbin* or */sbin* directory.
   ii. Create an FTP account.

      Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account pwftp. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

   iii. Modify the account password.

```
passwd pwftp
```

   iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

3. Configure vsftp.
   i. Open the vsftp configuration file.

```
vi /etc/vsftpd/vsftpd.conf
```

   ii. Change the value of anonymous_enable from `YES` to `NO`.
   iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES
        write_enable=YES
        chroot_local_user=YES
```

   iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.
4. Modify the shell configuration.
   i. Open the shell configuration file.

```
vi /etc/shells
```

   ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.
5. Start vsftp and perform a logon test.
   i. Start vsftp.

```
service vsftpd start
```

   ii. Use the account pwftp to perform an FTP logon test.

      This example uses the directory */alidata/www/wwwroot*.

2.1.13.3. Install vsftp in Ubuntu or Debian

This topic describes how to install and configure vsftp in an instance running Ubuntu or Debian to transfer files.

Procedure

1. Update the software source.

```
apt-get update
```

2. Install vsftp.

```
apt-get install vsftpd -y
```

3. Add an FTP account and a directory.
   i. Check the location of the *nologin* file,

      which is typically under the */usr/sbin* or */sbin* directory.
   ii. Create an FTP account.

      Run the following commands to create the */alidata/www/wwwroot* directory and specify this directory as the home directory of the account pwftp. You can also customize the account name and directory.

```
mkdir -p /alidata/www/wwwroot
useradd -d /alidata/www/wwwroot -s /sbin/nologin pwftp
```

   iii. Modify the account password.

```
passwd pwftp
```

   iv. Modify the permissions on the specified directory.

```
chown -R pwftp.pwftp /alidata/www/wwwroot
```

4. Configure vsftp.
   i. Open the vsftp configuration file.

```
vi /etc/vsftpd.conf
```

   ii. Change the value of anonymous_enable from `YES` to `NO`.
   iii. Delete the comment delimiter (`#`) from the following configuration lines:

```
local_enable=YES
        write_enable=YES
        chroot_local_user=YES
        chroot_list_enable=YES
        chroot_list_file=/etc/vsftpd.chroot_list
```

   iv. Press the Esc key to exit the edit mode, and enter `:wq` to save the modifications and exit.
   v. Open the */etc/vsftpd.chroot_list* file and add the FTP account name to the file. Save the modifications and exit.

      You can follow steps a to d to open and save the file.
5. Modify shell configurations.
   i. Open the shell configuration file.

```
vi /etc/shells
```

   ii. If the file does not contain */usr/sbin/nologin* or */sbin/nologin*, add it to the file.
6. Start vsftp and perform a logon test.
   i. Start vsftp.

```
service vsftpd restart
```

   ii. Use the account pwftp to perform an FTP logon test.

      This example uses the directory */alidata/www/wwwroot*.

2.1.13.4. Build an FTP site in Windows Server 2008

This topic describes how to build an FTP site on an instance running Windows Server 2008.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. Connect to an instance.
2. Choose **Start > Adminstrative Tools > Internet Information Services (IIS) Manager**.
3. Right-click the server name and select **Add FTP Site** from the shortcut menu.
4. Enter an FTP site name and a physical path, and then click **Next**.
5. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
6. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read** and **Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

2.1.13.5. Build an FTP site in Windows Server 2012

This topic describes how to build an FTP site on an instance running Windows Server 2012.

Prerequisites

You have added the Web Server (IIS) role and installed FTP on an instance.

Procedure

1. Connect to an instance.
2. Click the **Server Manager** icon.
3. In the left-side navigation pane, click **IIS**.
4. In the **Server** area, right-click the server name and select **Internet Information Services (IIS) Manager** from the shortcut menu.
5. Right-click the server name and select **Add FTP Site** from the shortcut menu.
6. Enter an FTP site name and a physical path, and then click **Next**.
7. Set **IP Address** to **All Unassigned** and **SSL** to **No SSL**, and then click **Next**.
8. Set **Authentication** to **Basic**, **Authorization** to **All Users**, and **Permissions** to **Read** and **Write**, and click **Finish**.

Result

Then you can use the administrator account and password to upload and download files through FTP. Make sure that the following conditions are met:

- The port for the FTP site is not in use by other applications, and Windows firewall is not blocking the port.
- The security group of the instance contains a security group rule that allows inbound access to the FTP port.

3.Container Service for Kubernetes

3.1. User Guide

3.1.1. Announcements

3.1.1.1. Container Service support for Kubernetes 1.18

Container Service strictly conforms to the terms of the Certified Kubernetes Conformance Program. This topic describes the changes that Container Service has made to support Kubernetes 1.18.

Version upgrades

Container Servcie has upgraded and optimized all of its components to support Kubernetes 1.18.8.

Key component	Version	Description
Kubernetes	1.18.8	Some frequently used API versions are deprecated in Kubernetes 1.18. Before you upgrade a Kubernetes cluster, we recommend that you upgrade the deprecated API versions that are listed in this topic.
Docker	19.03.5 (containerd 1.2.10)	No.
etcd	3.4.3	No.
CoreDNS	1.6.7	No.

Version details

- **Resource changes and deprecation**

  The following APIs are deprecated in Kubernetes 1.18:

  - The APIs apps/v1beta1 and apps/v1beta2 of all the resources are replaced by **apps/v1**.
  - The API extensions/v1beta1 of DaemonSets, Deployments, and ReplicaSets is replaced by **apps/v1**.
  - The API extensions/v1beta1 of Networkpolicies resources is replaced by **networking.k8s.io/v1**.
  - The API extensions/v1beta1 of pod security policies is replaced by **policy/v1beta1**.

  The label that specifies the regions of a node is changed to topology.kubernetes.io/region. The label that specifies the zone of a node is changed to topology.kubernetes.io/zone. We recommend that you update the related configurations for your workloads.

- **Feature upgrades**
  - Server-side Apply Beta 2 is introduced. You can view the relationships between the configuration items of a resource in the metadata.managedFields field of the resource.
  - The Node Local DNS Cache feature is released to improve the DNS availability and performance of your cluster.
  - The Volume Snapshot feature is in public preview and supports operations such as data volume backup, recovery, and scheduled backup.

Container Service upgrades for Kubernetes 1.18.8

In Kubernetes 1.18.8, Container Service enables the following feature in the kubelet configuration file: Users who use raw data volumes can upgrade clusters without the need to drain the nodes.

3.1.1.2. Vulnerability fixed: CVE-2021-1056 in NVIDIA GPU drivers

NVIDIA has reported the CVE-2021-1056 vulnerability, which is related to device isolation and NVIDIA GPU drivers. Elastic GPU Service nodes that are deployed in a Container Service cluster may also be exposed to this vulnerability. This topic describes the background information, affected versions, and fixes of this vulnerability.

Context

The CVE-2021-1056 vulnerability is related to device isolation and NVIDIA GPU drivers. This vulnerability allows an attacker to gain access to all GPU devices on a node by creating character device files in non-privileged containers that run on this node.

For more information about this vulnerability, see CVE-2021-1056.

Affected versions

The affected versions of NVIDIA GPU drivers are listed in the following figure based on the information published on the NVIDIA official website. For more information, see NVIDIA official website.

CVE IDs Addressed	Software Product	Operating System	Driver Branch	Affected Versions	Updated Driver Version
CVE-2021-1052 CVE-2021-1053	GeForce	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	NVIDIA RTX/Quadro, NVS	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	Tesla	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
CVE-2021-1056	GeForce	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
	NVIDIA RTX/Quadro, NVS	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
			R390	All version prior to 390.141	390.141
	Tesla	Linux	R460	All versions prior to 460.32.03	460.32.03
			R450	All versions prior to 450.102.04	450.102.04
			R418	All versions prior to 418.181.07	418.181.07

- If you selected a custom NVIDIA driver or updated an NVIDIA driver, check whether the NVIDIA driver that you installed is affected by this vulnerability based on the preceding figure.
- If you use the NVIDIA driver that is automatically installed by Container Service, you must check whether the Kubernetes version of your cluster is affected by this vulnerability. The following Kubernetes versions are affected by this vulnerability:
  - ACK 1.16.9-aliyun.1. By default, the NVIDIA driver of version 418.87.01 is installed in clusters of this Kubernetes version.
  - ACK 1.18.8-aliyun.1. By default, the NVIDIA driver of version 418.87.01 is installed in clusters of this Kubernetes version.

> **Note** The NVIDIA GPU drivers that are installed by default in clusters of other Kubernetes versions are not affected. The Container Service team of Alibaba Cloud will keep you informed of further CVE content updates and help you fix the vulnerability.

Check the version of the NVIDIA driver on a GPU-accelerated node

Log on to the GPU-accelerated node and run the following command to query the version of the NVIDIA driver.

> **Note** For more information about how to log on to a GPU-accelerated node, see the *Use VNC to connect to and log on to an instance* chapter of the *Elastic Compute Service (ECS) User Guide*.

```
nvidia-smi
```

Expected output:

```
Fri Apr 16 10:58:19 2021
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 418.87.01    Driver Version: 418.87.01    CUDA Version: 10.1     |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |
| Fan  Temp  Perf  Pwr:Usage/Cap|         Memory-Usage | GPU-Util  Compute M. |
|===============================+======================+======================|
|   0  Tesla V100-SXM2...  On   | 00000000:00:07.0 Off |                    0 |
| N/A   34C    P0    37W / 300W |      0MiB / 16130MiB |      0%      Default |
+-------------------------------+----------------------+----------------------+
+-----------------------------------------------------------------------------+
| Processes:                                                       GPU Memory |
|  GPU       PID   Type   Process name                             Usage      |
|=============================================================================|
|  No running processes found                                                 |
+-----------------------------------------------------------------------------+
```

The output indicates that the version of the NVIDIA driver is 418.87.01.

Fixes

Notice When you upgrade the NVIDIA driver for a node, the node must be restarted. This interrupts services that are deployed on the node.

Upgrade the NVIDIA driver based on the preceding figure.

Note For more information about how to upgrade the NVIDIA driver, see Upgrade the NVIDIA driver on a GPU node.

- If your NVIDIA driver belongs to the R390 branch, upgrade it to version 390.141.
- If your NVIDIA driver belongs to the R418 branch, upgrade it to version 418.181.07.
- If your NVIDIA driver belongs to the R450 branch, upgrade it to version 450.102.04.
- If your NVIDIA driver belongs to the R460 branch, upgrade it to version 460.32.03.

3.1.2. What is Container Service?

Container Service provides high-performance, scalable, and enterprise-class management service for Kubernetes containerized applications throughout the application lifecycle.

Container Service simplifies the deployment and scaling operations on Kubernetes clusters. Integrated with services such as virtualization, storage, network, and security, Container Service aims to provide the optimal cloud environment for Kubernetes containerized applications. Alibaba Cloud is a Kubernetes Certified Service Provider (KCSP). As one of the first services to participate in the Certified Kubernetes Conformance Program, Container Service provides you with professional support and services.

3.1.3. ACK@Edge overview

ACK@Edge is released for commercial use. ACK@Edge is a cloud-managed solution that is provided by Container Service to coordinate cloud and edge computing. This topic describes the background and features of edge Kubernetes clusters.

Overview

With the rapid growth of smart devices connected to the Internet and the advent of 5G and IoT, computing and storage services provided by traditional cloud computing platforms can no longer satisfy the needs of edge devices for time-efficient computing, larger storage capacity, and enhanced computing capacity. Edge Kubernetes clusters are intended for bringing cloud computing to edges (clients). Edge Kubernetes clusters can be created, managed, and maintained in the Container Service console. This is the trend of cloud computing.

An edge Kubernetes cluster is a standard, secure, and highly-available Kubernetes cluster deployed in the cloud. This type of cluster is integrated with features of Alibaba Cloud, such as virtualization, storage, networking, and security. This simplifies the management and maintenance of clusters and allows you to focus on your business development. ACK@Edge provides the following features:

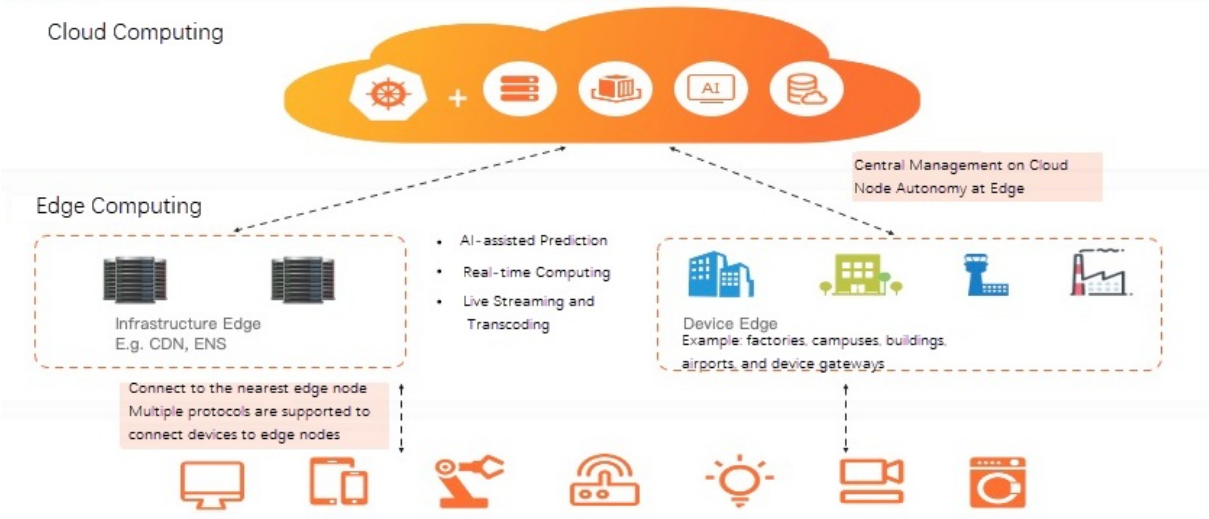
- Allows you to build a cloud-native infrastructure for edge computing with a few clicks.
- Allows you to quickly connect edge computing resources to the cloud. These resources include IoT gateway devices, terminals, Content Delivery Network (CDN) resources, and data centers.
- Applies to diverse scenarios, such as edge intelligence, intelligent buildings, intelligent factories, audio and video live streaming, online education, and CDN.

Edge Kubernetes clusters support features such as node autonomy, cell-based management, and native APIs for the management and maintenance of resources at the edge side. To use these features, you do not need to rewrite the logic of your services. This provides a native and centralized method for application lifecycle management and resource scheduling in edge computing scenarios.

Features

Edge Kubernetes clusters provide the following features to support lifecycle management for containerized applications and resources in edge computing scenarios:

- Allows you to create highly available edge Kubernetes clusters with a few clicks and provides lifecycle management on edge Kubernetes clusters, such as scaling cloud nodes, adding edge nodes to clusters, upgrading, logging, and monitoring. You can perform the preceding operations in the Container Service console.
- Supports access to various heterogeneous resources, such as data centers and IoT devices. Hybrid scheduling of heterogeneous resources is also supported.
- Supports node autonomy and network autonomy to ensure the reliability of edge nodes and services in edge computing scenarios where the network connection is weak.
- Supports reverse tunneling for management and maintenance of edge nodes.



3.1.4. Planning and preparation

Before you start using Container Service, you need to create cloud resources such as VPC networks, VSwitches, disks, and OSS buckets based on your application requirements.

Before you create a Kubernetes cluster, make the following preparations:

- **Create a VPC network** (optional)

  To create a cluster in an existing VPC network, you must create the VPC network and VSwitches in advance.

- **Create a volume** (optional)

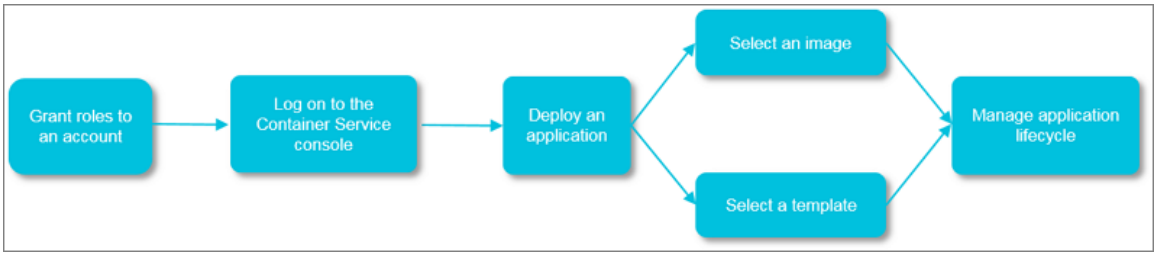
  To create a stateful application with network storage, you must create disks or OSS buckets in advance.

3.1.5. Quick start

3.1.5.1. Procedure

You can perform the following steps to use the Container Service service.

The following diagram shows the procedure to use the Container Service service.



Step 1: Authorize the default role

Authorize the default role of Container Service to perform operations on the resources that belong to the specified organization.

Step 2: Log on to the Container Service console

Log on to the Container Service console. For more information, see Log on to the Container Service console.

Step 3: Create an Container Service cluster

Set the network environment and the number of nodes, and configure node details.

Step 4: Deploy an application by using an image or orchestration template

You can use an existing image or orchestration template, or create a new image or orchestration template.

To create an application that consists of services based on different images, use an orchestration template.

Step 5: Manage the application lifecycle

3.1.5.2. Log on to the Container Service console

You can perform the following steps to log on to the Container Service console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.
5. In the top navigation bar, choose **Products > Elastic Computing > Container Service for Kubernetes**.
6. On the Container Service page, select **Access with Authorized Role** or **Access as Administrator**.
   - **Access with Authorized Role**: The system accesses the Container Service console by using an authorized account.
   - **Access as Administrator**: The system accesses the Container Service console as the organization administrator.

3.1.5.3. Create a Kubernetes cluster

This topic describes how to create a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Kubernetes Cluster** page, set basic configurations for the cluster.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Apsara Stack tenant account.

Parameter	Description
Region	Select the region where you want to deploy the Kubernetes cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create SNAT rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	You can select Docker or Sandboxed-Container.
MASTER Configuration	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.

Parameter	Description
WORKER Configuration	If you select **Create Instance** for **Worker Instance**, set the following parameters: ○ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ○ Selected Types: The selected instance types. ○ Quantity: Set the number of worker nodes. ○ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ○ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Alibaba Cloud Linux operating systems are supported.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR (optional)	For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an **existing** VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.

Parameter	Description
Internet Access	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster by using kubeconfig only from within the VPC.
SSH Logon	To enable SSH logon, you must first select Expose API Server with EIP. ◦ If you select Use SSH to Access the Cluster from the Internet, you can access the cluster through SSH. ◦ If you clear Use SSH to Access the Cluster from the Internet, you cannot access the cluster through SSH or kubectl. If you want to access an Elastic Compute Service (ECS) instance in the cluster through SSH, you must manually bind an EIP to the ECS instance and configure security group rules to open SSH port 22.
Security Group	You can select **Create Basic Security Group** or **Create Advanced Security Group**.
Ingress	Specify whether to **Install Ingress Controllers**. By default, **Install Ingress Controllers** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, the Ingress dashboard is created to collect and analyze the log of access to Ingresses. By default, **Install node-problem-detector and Create Event Center** is selected.
Monitoring Agents	Specify whether to enable **Prometheus Monitoring**. Prometheus Monitoring provides basic monitoring and alerting for the cluster.
Volume Plug-in	By default, **CSI** is selected.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
Node Protection	This check box is selected by default to prevent nodes from being deleted in the console or by calling API operations.
Labels	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that can be assigned to a node.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster certification authority (CA) certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ◦ Run scripts during instance startup. ◦ Import user data as common data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

After the cluster is created, you can view the created cluster on the **Clusters** page in the Container Service console.

3.1.5.4. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Context

This topic describes how to use an orchestration template to create an NGINX application that consists of a Deployment and a Service. The Deployment provisions pods for the application and the Service manages access to the pods at the backend.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.

5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. Configure the template and click **Create**.
   - **Sample Template**: Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
   - **Add Deployment**: This feature allows you to quickly define a YAML template.
   - **Use Existing Template**: You can import an existing template to the configuration page.

   The following NGINX template is based on an orchestration template provided by Container Service. You can use this template to quickly create a Deployment to run an NGINX application

   > **Note** Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This allows you to define multiple resource objects in a single template.

```
apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
    name: nginx-deployment
    labels:
      app: nginx
spec:
    replicas: 2
    selector:
      matchLabels:
        app: nginx
    template:
      metadata:
        labels:
          app: nginx
      spec:
        containers:
        - name: nginx
          image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
          ports:
          - containerPort: 80
---
apiVersion: v1     # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
   name: my-service1        #TODO: to specify your service name
   labels:
     app: nginx
spec:
   selector:
     app: nginx             #TODO: change label selector to match your backend pod
   ports:
   - protocol: TCP
     name: http
     port: 30080            #TODO: choose an unique port on each node to avoid port conflict
     targetPort: 80
   type: LoadBalancer        ## In this example, the type is changed from NodePort to LoadBalancer
.
```

7. Click **Create**. A notification that indicates the deployment status appears.

After the application is created, choose **Network > Services** in the left-side navigation pane. On the Services page, you can find that a Service named my-service1 is created for the application. The external endpoint of the Service is also displayed on the page. Click the endpoint in the **External Endpoint** column.

8. You can visit the NGINX welcome page in the browser.

3.1.6. Kubernetes clusters

3.1.6.1. Authorizations

3.1.6.1.1. Assign RBAC roles to a RAM user

This topic describes how to assign role-based access control (RBAC) roles to Resource Access Management (RAM) users. By default, RBAC is enabled for Kubernetes 1.6 and later. RBAC is important for you to manage clusters. You can use RBAC to specify the types of operations that are allowed for specific users based on their roles in an organization.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Authorizations**.
3. On the **RAM Users** tab, select the RAM user to which you want to grant permissions and click **Modify Permissions**.

   > **Note** If you log on to the Container Service console as a RAM user, make sure that the RAM user is assigned the predefined RBAC administrator role or the cluster-admin role.

4. On the **Configure Role-Based Access Control (RBAC)** wizard page, click **Add Permissions** to add cluster-scoped or namespace-scoped permissions and select a predefined or custom RBAC role in the Permission column. You can also click the minus sign (-) to delete permissions. After you add the permissions, click **Next Step**.

   > **Note** For each RAM user, you can assign only one predefined RBAC role but one or more custom RBAC roles to manage the same cluster or namespace.

   The following table describes the permissions that the predefined and custom RBAC roles have on clusters and namespaces.

   Roles and permissions

Role	RBAC permissions on cluster resources
Administrator	Read and write permissions on resources in all namespaces.
O&M Engineer	Read and write permissions on resources in all namespaces and read-only permissions on nodes, persistent volumes (PVs), namespaces, and service quotas within a cluster.

Role	RBAC permissions on cluster resources
Developer	Read and write permissions on resources in a specified namespace or all namespaces.
Restricted User	Read-only permissions on resources in a specified namespace or all namespaces.
Custom	The cluster role that you select for a custom role determines what permissions the custom role has. Before you select a cluster role, make sure that you are aware of the permissions that the cluster role has in case the RAM user is granted excessive permissions.

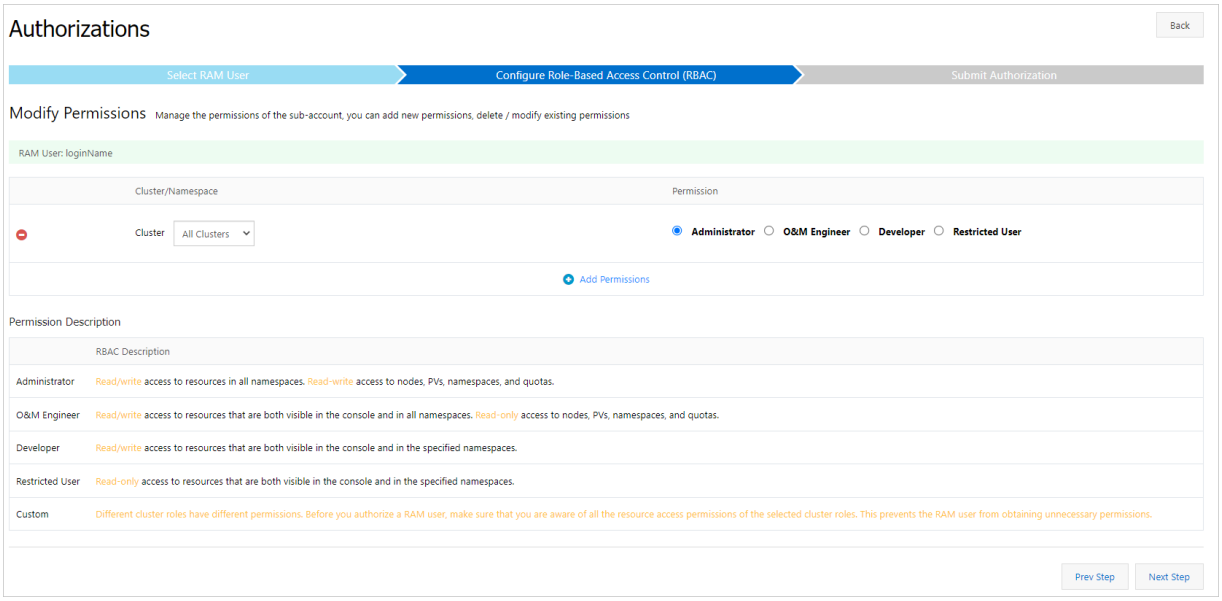
After the authorization is complete, you can use the account of the specified RAM user to log on to the Container Service console. For more information, see Log on to the Container Service console.

Predefined and custom RBAC roles

Container Service provides the following predefined RBAC roles: administrator, O&M engineer, developer, and restricted user. You can use these roles to regulate Container Service access control in most scenarios. In addition, you can use custom roles to customize permissions on clusters.

Container Service provides a set of custom RBAC roles.

> **Note** The cluster-admin role is similar to a super administrator. By default, the cluster-admin role has the permissions to manage all resources within a cluster.



You can log on to a master node of a cluster and run the following command to view the custom RBAC roles that are assigned to the current account:

```
# kubectl get clusterrole
```

```
# kubectl get clusterrole
NAME                                                                   AGE
admin                                                                  13d
alibaba-log-controller                                                 13d
alicloud-disk-controller-runner                                        13d
cluster-admin                                                          13d
cs:admin                                                               13d
edit                                                                   13d
flannel                                                                13d
kube-state-metrics                                                     22h
node-exporter                                                          22h
prometheus-k8s                                                         22h
prometheus-operator                                                    22h
system:aggregate-to-admin                                              13d
....
system:volume-scheduler                                                13d
view                                                                   13d
```

Run the following command to view the details of a role, for example, the cluster-admin role:

```
# kubectl get clusterrole cluster-admin -o yaml
```

Notice After a RAM user is assigned the cluster-admin role, the RAM user has the same permissions as the Alibaba Cloud account to which the RAM user belongs. The RAM user has full control over all resources within the cluster. Proceed with caution.

```
# kubectl get clusterrole cluster-admin  -o yaml

3.1.6.2. Clusters

3.1.6.2.1. Create a Kubernetes cluster

This topic describes how to create a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Kubernetes Cluster** page, set basic configurations for the cluster.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Apsara Stack tenant account.
Region	Select the region where you want to deploy the Kubernetes cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create SNAT rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	You can select Docker or Sandboxed-Container.

Parameter	Description
MASTER Configuration	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.
WORKER Configuration	If you select **Create Instance** for **Worker Instance**, set the following parameters: ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ Selected Types: The selected instance types. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ◦ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Alibaba Cloud Linux operating systems are supported.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.

Parameter	Description
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR (optional)	For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an **existing** VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.
Internet Access	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster by using kubeconfig only from within the VPC.
SSH Logon	To enable SSH logon, you must first select Expose API Server with EIP. ◦ If you select Use SSH to Access the Cluster from the Internet, you can access the cluster through SSH. ◦ If you clear Use SSH to Access the Cluster from the Internet, you cannot access the cluster through SSH or kubectl. If you want to access an Elastic Compute Service (ECS) instance in the cluster through SSH, you must manually bind an EIP to the ECS instance and configure security group rules to open SSH port 22.
Security Group	You can select **Create Basic Security Group** or **Create Advanced Security Group**.
Ingress	Specify whether to **Install Ingress Controllers**. By default, **Install Ingress Controllers** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, the Ingress dashboard is created to collect and analyze the log of access to Ingresses. By default, **Install node-problem-detector and Create Event Center** is selected.

Parameter	Description
Monitoring Agents	Specify whether to enable **Prometheus Monitoring**. Prometheus Monitoring provides basic monitoring and alerting for the cluster.
Volume Plug-in	By default, **CSI** is selected.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
Node Protection	This check box is selected by default to prevent nodes from being deleted in the console or by calling API operations.
Labels	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that can be assigned to a node.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster certification authority (CA) certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run scripts during instance startup. ○ Import user data as common data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

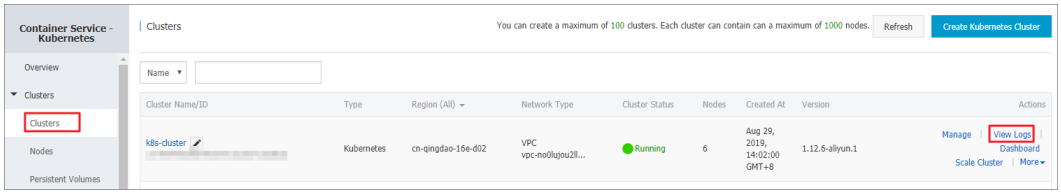
After the cluster is created, you can view the created cluster on the **Clusters** page in the Container Service console.

3.1.6.2.2. View log files of a cluster

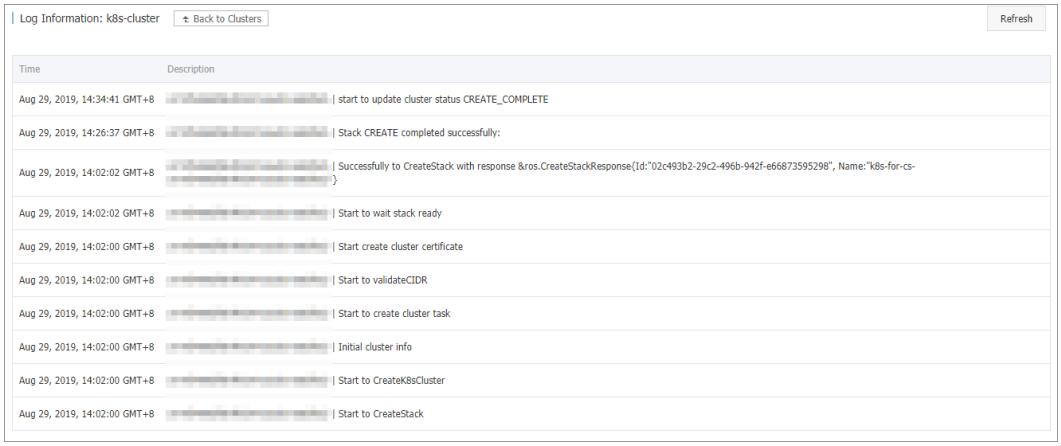
You can view the operation log of a cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. Find the cluster that you want to manage and click **View Logs** in the Actions column.



You can view operations performed on the cluster.



3.1.6.2.3. Connect to a cluster through kubectl

You can use the Kubernetes command line tool, kubectl, to connect to a Kubernetes cluster from a local computer.

Procedure

1. Download the latest kubectl client from the Kubernetes change log page.
2. Install and set up the kubectl client.

   For more information, see Install and set up kubectl.
3. Configure the cluster credentials.

   You can use the `scp` command to securely copy the master node configuration file from the `/etc/kubernetes/kube.conf` directory of the master VM and paste it to the `$HOME/.kube/config` directory of the local computer, where the `kubectl` credentials are expected to be stored.

   ```
   mkdir $HOME/.kube
   scp root@<master-public-ip>:/etc/kubernetes/kube.conf $HOME/.kube/config
   ```

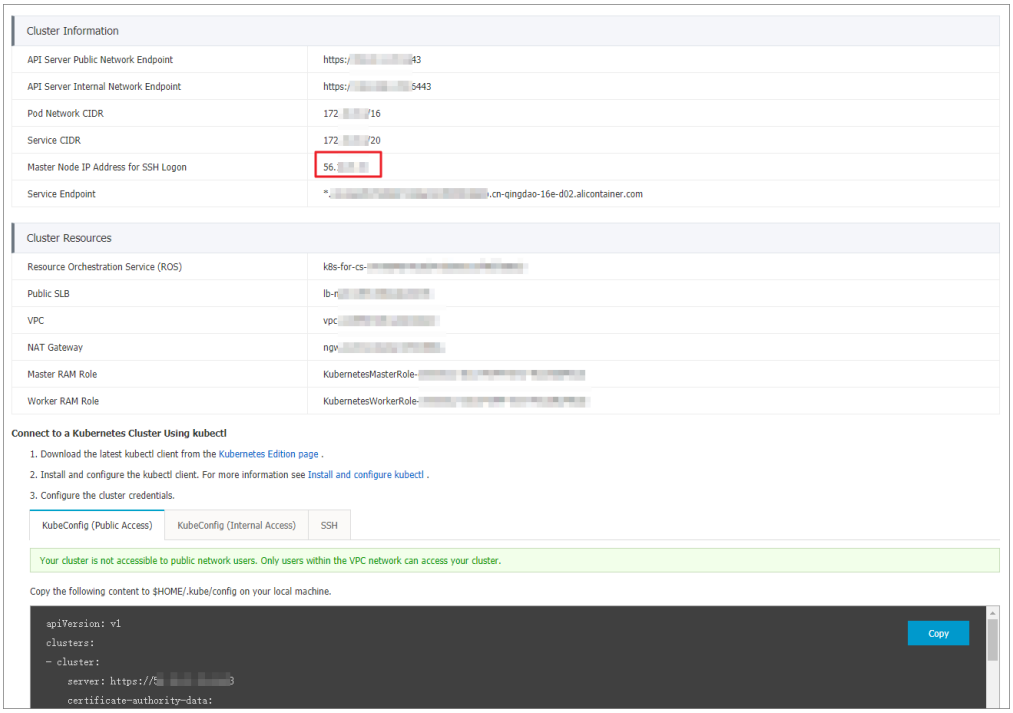
   You can find `master-public-ip` on the cluster details page.

   i. Log on to the Container Service console.

   ii. In the left-side navigation pane, click **Clusters**. The Clusters page appears.

iii. Find the target cluster and click **Manage** in the Actions column.

In the **Cluster Information** section, you can find the master node IP address.



3.1.6.2.4. Connect to a master node by using SSH

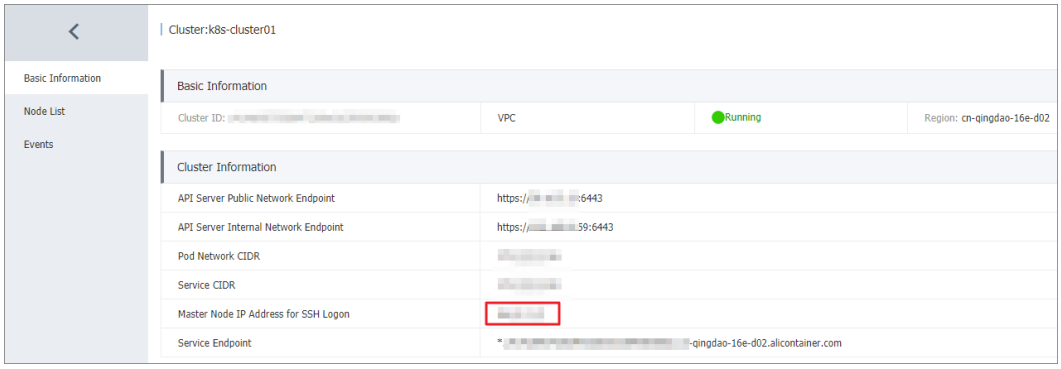
You can access a master node in a cluster by using a Secure Shell (SSH) client.

Prerequisites

- A Kubernetes cluster is created and **Use SSH to Access the Cluster from the Internet** is selected for the cluster. For more information, see Create a Kubernetes cluster.
- The SSH client can connect to the network where the cluster is deployed.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Clusters** > **Clusters** to go to the Clusters page. Find the cluster that you want to manage, and click Manage in the Actions column for the cluster.
3. The Basic Information page appears. In the Cluster Information section, you can find the IP address that is displayed in the **Master Node IP Address for SSH Logon** field.



4. Use SSH to connect to the cluster from an SSH client that has access to the cluster network.
   - If you have a leased line that connects to the cluster network over the Internet, you can use tools such as PuTTY to create an SSH connection.
   - If you have an Elastic Compute Service (ECS) instance that is connected to the Virtual Private Cloud (VPC) network of the cluster, run the following command to create an SSH connection:

     ```
     ssh    root@ssh_ip                    #ssh_ip specifies the IP address of the master node for SSH connection.
     ```

3.1.6.2.5. Expand a cluster

This topic describes how to scale out the worker nodes of a Kubernetes cluster in the Container Service console.

Context

You cannot scale out the master nodes of a Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to expand and choose **More > Expand** in the **Actions** column.
4. On the **Node Pools** page, select the node pool that you want to scale out and click **Scale Out** in the **Actions** column.
5. Go to the Expand page and set the required parameters.

   In this example, the number of worker nodes in the cluster is increased from three to five. The following table describes the required parameters.

Parameter	Description
Nodes to Add	Specify the number of nodes to be added to the cluster.
Region	By default, the region where the cluster is deployed is displayed.
Container Runtime	By default, the container runtime of the cluster is displayed.
VPC	By default, the virtual private cloud (VPC) of the cluster is displayed.
VSwitch	Select one or more vSwitches for the cluster. You can select at most three vSwitches that are deployed in different **zones**.
Instance Type	You can select one or more instance types. For more information, see the *Instance types* topic of *ECS User Guide*.
Selected Types	The selected instance types.
System Disk	Standard SSDs, enhanced SSDs (ESSDs), and ultra disks are supported.
Mount Data Disk	Standard SSDs, ESSDs, and ultra disks are supported.
Operating System	The operating system of the cluster.
Password	◦ **Password**: Enter the password that is used to log on to the nodes. ◦ **Confirm Password**: Enter the password again.

Parameter	Description
ECS Label	You can add labels to the ECS instances.
Node Label	Add labels to nodes.
Taints	Add taints to the worker nodes in the cluster.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
RDS Whitelist	Set the Relational Database Service (RDS) whitelist. Add the IP addresses of the nodes in the cluster to the RDS whitelist.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used in the following ways: ○ Run scripts during instance startup. ○ Import user data as normal data to an ECS instance for future reference.

6. Click **Submit**.

What's next

After the cluster is expanded, choose **Nodes > Nodes** in the left-side navigation pane. On the Nodes page, you can find that the number of worker nodes is increased from 3 to 5.

3.1.6.2.6. Renew a certificate

This topic describes how to renew a Kubernetes cluster certificate in the console.

Prerequisites

A Kubernetes cluster is created and the cluster certificate is about to expire.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. Select the cluster for which you want to renew the certificate and click **Update Certificate**. The **Update Certificate** message appears.

   > **Note** The **Update Certificate** button will be displayed two months before your cluster certificate expires.

4. Click **Update** and the **Confirm** page appears.
5. Click **OK**.

Result

- On the **Update Certificate** page, the following message appears: **The certificate has been updated**.
- On the **Clusters** page, the **Update Certificate** button disappears.

3.1.6.2.7. Delete a Kubernetes cluster

This topic describes how to delete a Kubernetes cluster in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to delete and choose **More > Delete** in the **Actions** column.
4. In the **Delete Cluster** dialog box that appears, select the resources that you want to retain, select **I understand the above information and want to delete the specified cluster**, and then click **OK**.

What's next

Resource Orchestration Service (ROS) does not have permissions to delete resources that are manually added to resource created by ROS. For example, if you manually add a vSwitch to a virtual private cloud (VPC) created by ROS, ROS cannot delete the VPC and therefore the cluster cannot be deleted.

Container Service allows you to forcibly delete clusters. If your first attempt to delete a cluster fails, you can forcibly delete the cluster and ROS resource stack. However, you still need to manually release the resources that are manually added.

An error message appears when an attempt to delete a cluster fails.

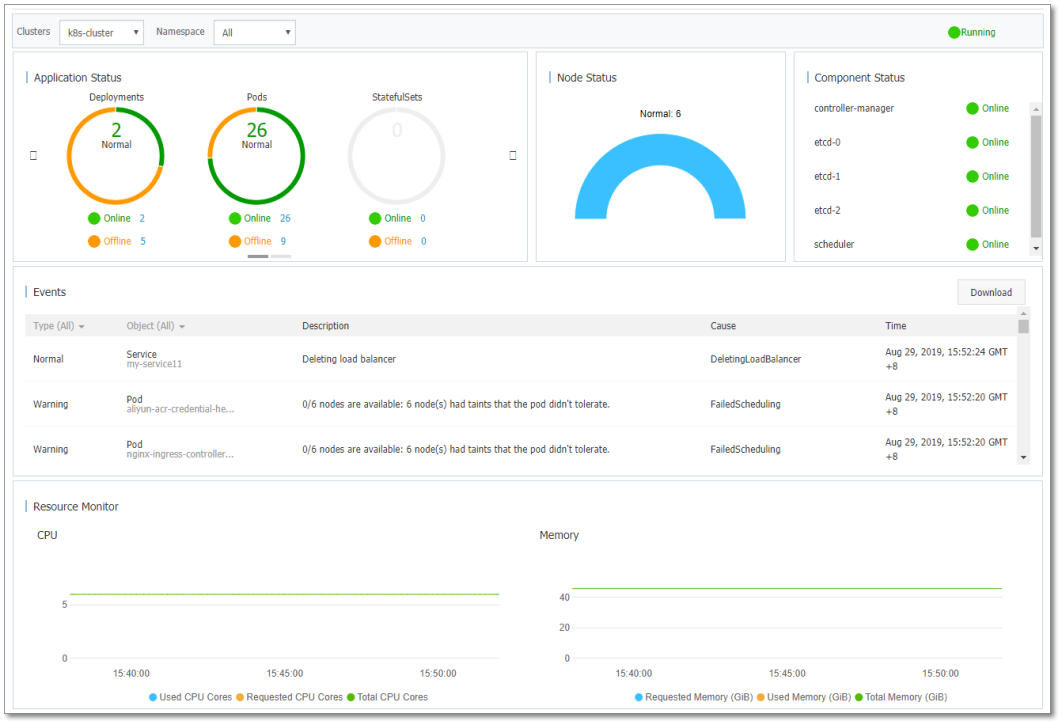
Select the cluster that you failed to delete and choose **More > Delete** in the Actions column. In the dialog box that appears, you can view the resources that are manually added. Select the **Force Delete** check box and click **OK** to delete the cluster and ROS resource stack.

3.1.6.2.8. View cluster overview

The Container Service console provides a cluster overview page. This page displays the information such as application status, component status, and resource monitoring status. This allows you to check the health status of your cluster at your convenience.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Overview**. The Overview page appears.
3. Select the target cluster and namespace. You can view the application status, component status, and resource monitoring charts.
   - **Application Status**: displays the statuses of the deployments, pods, and replica sets that are running in the cluster. Green sections indicate a normal state and yellow sections indicate an exception state.
   - **Node Status**: displays the statuses of the nodes in the cluster.
   - **Component Status**: Components are deployed in the kube-system namespace. Core components are used, such as the scheduler, controller-manager, and etcd.
   - **Events**: displays events such as warnings and errors. If no events are displayed, the cluster is running in the normal state.
   - **Monitoring**: displays CPU and memory monitoring charts. CPU usage is measured in cores or millicores and accurate to three decimal places. A millicore is one thousandth of a core. Memory usage is measured in GiB and accurate to three decimal places. For more information, see Meaning of CPU and Meaning of memory.



3.1.6.3. Nodes

3.1.6.3.1. Add existing nodes to a Kubernetes cluster

Container Service allows you to add an existing Elastic Compute Service (ECS) instance to a Kubernetes cluster. You can add only worker nodes to clusters.

Prerequisites

- A Kubernetes cluster is created. For more information, see Log on to the Container Service console.
- An ECS instance is created. Make sure that the region, zone, organization, project, security group, virtual private cloud (VPC), and operating system settings of the ECS instance are the same as those of the cluster.

Context

- By default, a cluster can contain at most 50 nodes. To increase the quota, submit a ticket.
- The ECS instance that you add must be in the same region and VPC as the cluster.
- The ECS instance must belong to the same Apsara Stack tenant account as the cluster.
- The ECS instance must be running the CentOS operating system.

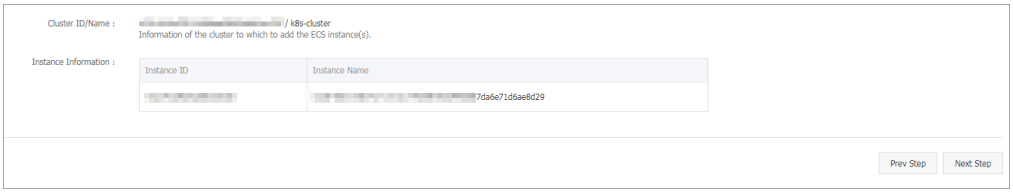
Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. In the upper-right corner of the page, click **Add Existing Node**.
6. On the page that appears, you can manually add existing ECS instances to the cluster.

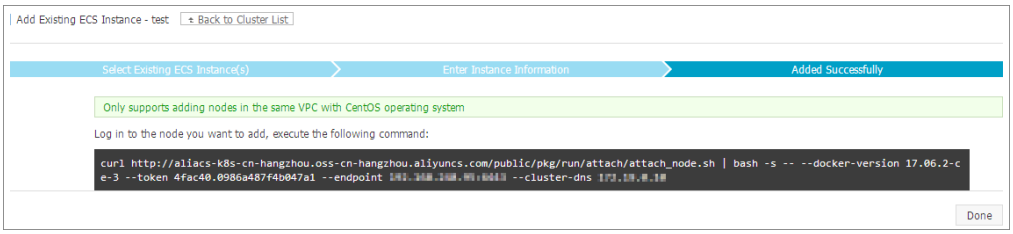
   To manually add an ECS instance, you must obtain the installation command and log on to the ECS instance to run the command. You can add only one ECS instance at a time.

i. Select **Manual**, find and select the ECS instance that you want to add, and then click **Next Step**. You can add only one ECS instance at a time.

ii. Confirm the instance information and click **Next Step**.



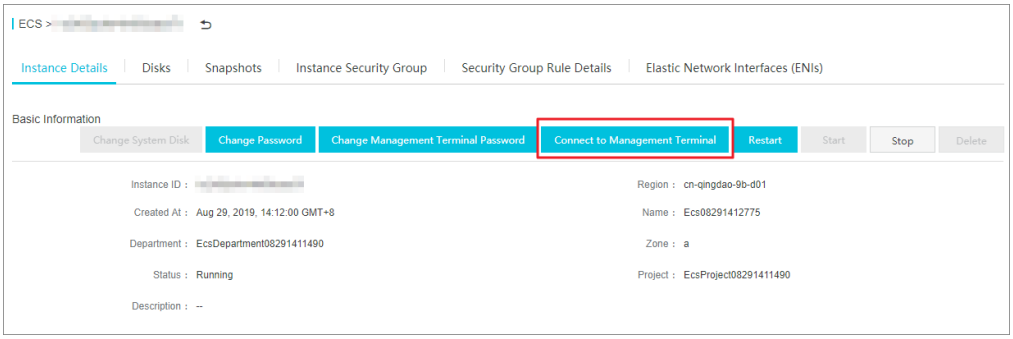
iii. On the Complete wizard page, copy the command.

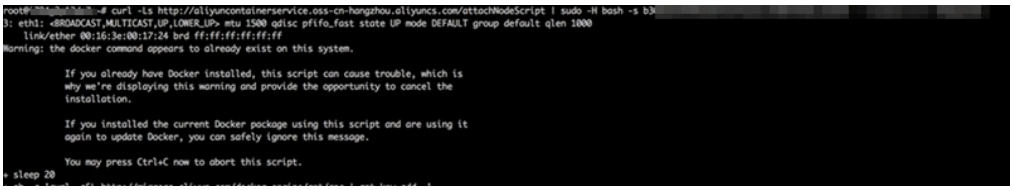


iv. Click **Done**.

v. Go to the Apsara Uni-manager Management Console. In the top navigation bar, choose **Products > Elastic Compute Service**. On the **Instances** page, select the organization and region of the cluster, and then find the ECS instance that you want to add to the cluster.

vi. Click the instance name to go to the Instance Details tab. Click **Connect to VNC**. In the dialog box that appears, enter the VNC password and then click **OK**. After you log on to the instance, paste the copied command and click **OK** to run the script.





vii. After the script is executed, the ECS instance is added to the cluster. You can go to the Clusters page and click the cluster ID to view nodes in the cluster. Check whether the ECS instance has been added to the cluster.

3.1.6.3.2. View nodes

You can view nodes of a Kubernetes cluster by using the Container Service console, kubectl, or Kubernetes Dashboard.

View nodes by using kubectl

> **Note** To view the nodes in a cluster by using kubectl, you must Connect to a Kubernetes cluster through kubectl.

Connect to a cluster by using kubectl and run the following command to view the nodes in the cluster:

```
kubectl get nodes
```

Sample output:

```
$ kubectl get nodes
    NAME                       STATUS    AGE       VERSION
    iz2ze2n6ep53tch701yh9zz    Ready     19m       v1.6.1-2+ed9e3d33a07093
    iz2zeafr762wibijx39e5az    Ready     7m        v1.6.1-2+ed9e3d33a07093
    iz2zeafr762wibijx39e5bz    Ready     7m        v1.6.1-2+ed9e3d33a07093
    iz2zef4dnn9nos8elyr32kz    Ready     14m       v1.6.1-2+ed9e3d33a07093
    iz2zeitvvo8enoreufstkmz    Ready     11m       v1.6.1-2+ed9e3d33a07093
```

View nodes by using the Container Service console

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes** to view the nodes in the cluster.

3.1.6.3.3. Manage node labels

You can manage node labels in the Container Service console. You can add a label to multiple nodes at a time, filter nodes by label, and delete labels.

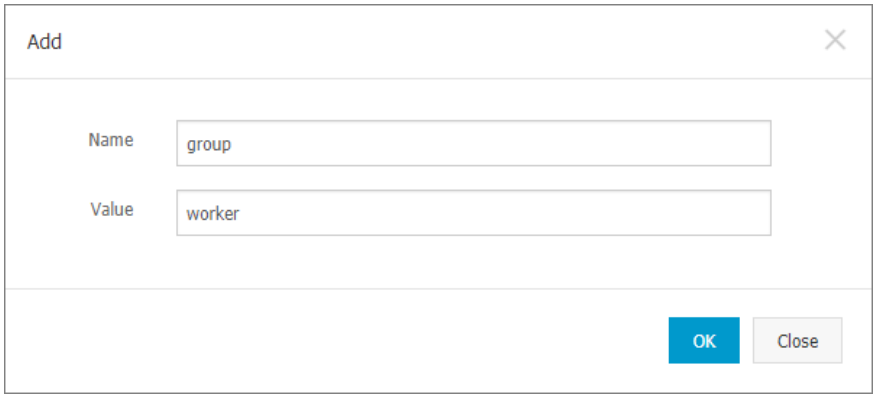
You can use labels to schedule nodes. For more information, see Set node scheduling.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Add a label to multiple nodes at a time

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select multiple nodes and click **Add Label**.
7. In the dialog box that appears, enter the name and value of the label and click **OK**.



On the Labels tab, you can find that the selected nodes have the same label.

Delete a label

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select a node, find the label that you want to delete, and then click the icon. In the message that appears, click **Confirm**.

   After the label is deleted, it is removed from the Labels column.

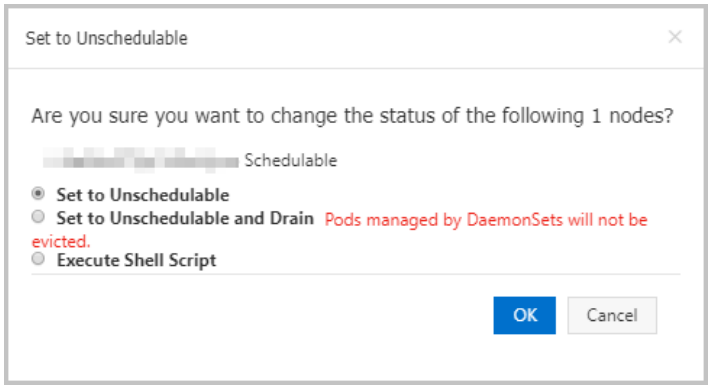
3.1.6.3.4. Set node schedulability

You can mark a node as schedulable or unschedulable in the Container Service console. This allows you to optimize the distribution of the loads on each node. This topic describes how to set node schedulability.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the Nodes page, select the node that you want to manage and click **Drain/Set to Unschedulable** in the Actions column.
6. In the dialog box that appears, you can change the status of the node.
   - If you select **Set to Unschedulable**, pods will not be scheduled to this node when you deploy new applications.
   - If you select **Set to Unschedulable and Drain**, pods will not be scheduled to this node when you deploy new applications. Pods on this node will be evicted, except for the pods that are managed by DaemonSets.

     In this example, **Set to Unschedulable** is selected.



7. Click **OK**.

   The status of the node is changed to Unschedulable.

What's next

Pods will not be scheduled to the node when you deploy new applications.

3.1.6.3.5. Remove a node

To restart or release an Elastic Compute Service (ECS) node in a cluster, you must first remove the node from the cluster. This topic describes how to remove a node.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- You can connect to the Kubernetes cluster by using kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.

Context

- When you remove a node, pods that run on the node are migrated to other nodes. This may cause service interruption. We recommend that you remove nodes during off-peak hours.
- Unknown errors may occur when you remove nodes. Before you remove nodes, we recommend that you back up data on these nodes.
- Nodes remain in the unschedulable state when they are being removed.
- You can remove only worker nodes. You cannot remove master nodes.

Procedure

1. Run the following command to migrate the pods on the node that you want to remove to other nodes.

   > **Note** Make sure that the other nodes have sufficient resources for these pods.

   ```
   kubectl drain node-name
   ```

   > **Note** *node-name* must be in the format of *your-region-name.node-id*.
   >
   > - *your-region-name* specifies the region where the cluster that you want to manage is deployed.
   > - *node-id* specifies the ID of the ECS instance where the node to be removed is deployed. Example: *cn-hanghzou.i-xxx*.

2. Log on to the Container Service console.
3. In the left-side navigation pane, click **Clusters**.

4. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
5. In the left-side navigation pane of the details page, choose **Nodes > Node**.
6. Find the node that you want to remove and choose **More > Remove** in the **Actions** column.

   > **Note** To remove multiple nodes at a time, select the nodes that you want to remove on the **Nodes** page and click **Batch Remove**.

7. (Optional)Set parameters in the Remove Node dialog box.
   - Select **Drain the Node** to migrate the pods on the node to other nodes. If you select this option, make sure that the other nodes have sufficient resources for these pods.
   - Select **Release ECS Instance** to release the ECS instance where the node is deployed.

   > **Note**
   > - Select this option to release only pay-as-you-go ECS instances.
   > - Subscription ECS instances are automatically released after the subscription expires.
   > - If you do not select **Release ECS Instance**, you are still billed for the ECS instance where the node is deployed.

8. In the **Remove Node** message, click **OK**.

3.1.6.3.6. View node resource usage

You can view the resource usage of the nodes in a cluster in the Container Service console.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the Nodes page, find the node that you want to manage and choose **More > Details** in the **Actions** column.

   You can view the request rate and usage rate of CPU and memory resources on each node.
   - CPU request rate = sum (The amount of CPU resources requested by all pods on the node) / Total CPU resources of the node
   - CPU usage rate = sum (The amount of CPU resources used by all pods on the node) / Total CPU resources of the node
   - Memory request rate = (The amount of memory resources requested by all pods on the node) / Total memory resources of the node
   - Memory usage rate = sum (The amount of memory resources used by all pods on the node) / Total memory resources of the node

> **Note**
> - You can adjust the workload of a node based on the resource usage. For more information, see Set node scheduling.
> - When the request or usage rate of a node reaches 100%, pods are not scheduled to the node.

3.1.6.3.7. Node pools

3.1.6.3.7.1. Create a node pool

You can use a node pool to manage a set of nodes for a Container Service cluster. For example, you can manage the labels and taints that are added to the nodes in a node pool. This topic describes how to create a node pool in the Container Service console.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- The Kubernetes version of the cluster must be later than 1.9.

> **Notice**
> - By default, a cluster can contain at most 100 nodes.
> - Before you add an existing Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC), make sure that an elastic IP address (EIP) is associated with the ECS instance, or a NAT gateway is created for the VPC. In addition, the node must have access to the Internet. Otherwise, you may fail to add the ECS instance.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool**.
6. In the **Create Node Pool** dialog box, set the parameters.

   For more information, see Create a Kubernetes cluster. The following list describes some of the parameters:

   - Name: the name of the node pool.
   - Public IP: If you select Assign a Public IPv4 Address to Each Node, public IPv4 addresses are assigned to the nodes in the node pool. You can connect to the nodes by using the assigned IP addresses.
   - Quantity: Specify the initial number of nodes in the node pool. If you do not want to add nodes to the node pool, set this parameter to 0.
   - ECS Label: Add labels to the ECS instances.
   - Node Label: Add labels to the nodes in the node pool.
   - CPU Policy: Set the CPU policy.
     - None: indicates that the default CPU affinity is used. This is the default policy.
     - Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
   - Custom Node Name: Specify whether to use custom node names.

A custom node name consists of a prefix, an IP substring, and a suffix.

- Both the prefix and suffix can contain one or more parts that are separated by periods (.).These parts can contain lowercase letters, digits, and hyphens (-), and must start and end with a lowercase letter or digit.
- The IP substring length specifies the number of digits to be truncated from the end of the returned node IP address. Valid values: 5 to 12.

For example, if the node IP address is 192.1xx.x.xx, the prefix is aliyun.com, the IP substring length is 5, and the suffix is test, the node name will be aliyun.com00055test.

7. Click **Confirm Order**.
   On the **Node Pools** page, check the **state** of the node pool. If the node pool is in the **Initializing** state, it indicates that the node pool is being created. After the node pool is created, the **state** of the node pool changes to **Active**.

What's next

After the node pool is created, find the node pool on the **Node Pools** page and click **Details** in the **Actions** column to view the details of the node pool.

3.1.6.3.7.2. Scale out a node pool

You can use a node pool to manage multiple nodes in a Kubernetes cluster as a group. For example, you can centrally manage the labels and taints of the nodes in a node pool. This topic describes how to scale out a node pool in the Container Service console.

Prerequisites

A node pool is created. For more information, see Create a node pool.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, select the node pool that you want to manage and click **Scale Out** in the **Actions** column.
6. In the dialog box that appears, set the number of nodes that you want to add to the node pool.
7. (Optional)In the dialog box that appears, click **Modify Node Pool Settings** to modify the configurations of the node pool.

   For more information, see Create a Kubernetes cluster. The following list describes some of the parameters:

   - Public IP: If you select Assign a Public IPv4 Address to Each Node, public IPv4 addresses are assigned to the nodes in the node pool. You can connect to the nodes by using the assigned IP addresses.
   - ECS Label: Add labels to the ECS instances.
   - Node Label: Add labels to the nodes in the node pool.
   - Taints: Add taints to all worker nodes in the Kubernetes cluster.

   > **Note**
   > - If you select **Synchronize Node Labels and Taints**, the added labels and taints are synchronized to both existing and newly added nodes.
   > - If you select **Set New Nodes to Unschedulable**, the nodes are unschedulable when they are added to the cluster.

8. Click **Submit**.
   On the **Node Pools** page, the **state** of the node pool is **Scaling**. This indicates that the scale-out event is in progress. After the scale-out event is completed, the **state** of the node pool changes to **Active**.

What's next

Click **Details** in the Actions column for the node pool. On the **Nodes** tab, you can check the nodes that are added to the node pool.

3.1.6.3.7.3. Schedule an application pod to a specific node pool

Label is an important concept of Kubernetes. Services, Deployments, and pods are associated with each other by labels. You can configure pod scheduling policies based on node labels. This allows you to schedule pods to nodes that have specific labels. This topic describes how to schedule an application pod to a specific node pool.

Procedure

1. Add a label to the nodes in a node pool.

   Container Service allows you to manage a group of cluster nodes by using a node pool. For example, you can centrally manage the labels and taints of the nodes in a node pool. For more information about how to create a node pool, see Create a node pool.

   i. Log on to the Container Service console.
   ii. In the left-side navigation pane, click **Clusters**.
   iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iv. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
   v. In the upper-right corner of the **Node Pools** page, click **Create Node Pool**.
   vi. In the Create Node Pool dialog box, click **Show Advanced Options** and click  on the right of **Node Label** to add labels to nodes.

   In this example, the pod: nginx label is added.

   You can also click **Scale Out** on the right side of a node pool to update or add labels for the nodes. If automatic scaling is enabled for a node pool, click **Modify** on the right side of the node pool to update or add labels for the nodes.

2. Configure a scheduling policy for an application pod.

   After the preceding step is completed, the pod: nginx label is added to the nodes in the node pool. You can set the nodeSelector or nodeAffinity field in pod configurations to ensure that an application pod is scheduled to nodes with matching labels in a node pool. Perform the following steps:

   - Set nodeSelector.

     nodeSelector is a field in the spec section of pod configurations. Add the pod: nginx label to nodeSelector. Sample template:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-deployment-basic
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      nodeSelector:
        pod: nginx      # After you add the label in this field, the application pod can run on
ly on nodes with this label in the node pool.
      containers:
      - name: nginx
        image: nginx:1.7.9
        ports:
        - containerPort: 80
```

- Set nodeAffinity.

  You can also use nodeAffinity to schedule an application pod based on your requirements. nodeAffinity supports the following scheduling policies:

  ```
  - requiredDuringSchedulingIgnoredDuringExecution
  ```

  If this policy is used, a pod can be scheduled only to a node that meets the match rules. If no node meets the match rules, the system retries until a node that meets the rules is found. IgnoreDuringExecution indicates that if the label of the node where the pod is deployed changes and no longer meets the match rules, the pod continues to run on the node.

  ```
  - requiredDuringSchedulingRequiredDuringExecution
  ```

  If this policy is used, the pod can be scheduled only to a node that meets the match rules. If no node meets the rules, the system retries until a node that meets the rules is found. RequiredDuringExecution indicates that if the label of the node where the pod is deployed changes and no longer meets the match rules, the system redeploys the pod to another node that meets the rules.

  ```
  - preferredDuringSchedulingIgnoredDuringExecution
  ```

  If this policy is used, the pod is preferably scheduled to a node that meets the match rules. If no node meets the rules, the system ignores the rules.

  ```
  - preferredDuringSchedulingRequiredDuringExecution
  ```

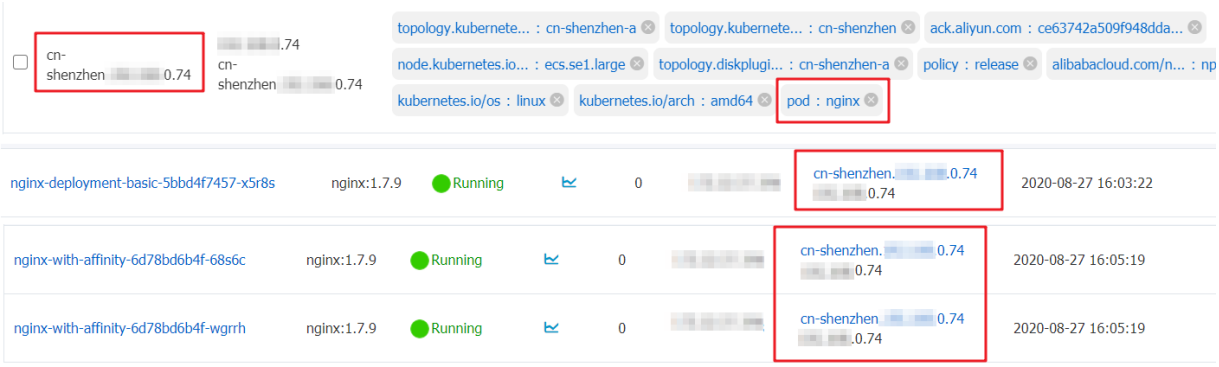
  If this policy is used, the pod is preferably scheduled to a node that meets the match rules. If no node meets the rules, the system ignores the rules. RequiredDuringExecution indicates that if the label of a node where the pod is deployed changes and still meets the match rules, the system reschedules the pod to a node that meets the match rules.

  In the following example, the requiredDuringSchedulingIgnoredDuringExecution policy is used to ensure that the application pod always runs on a node in a specific node pool.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-with-affinity
  labels:
    app: nginx-with-affinity
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx-with-affinity
  template:
    metadata:
      labels:
        app: nginx-with-affinity
    spec:
      affinity:
        nodeAffinity:
          requiredDuringSchedulingIgnoredDuringExecution:
            nodeSelectorTerms:
            - matchExpressions:
              - key: pod
                operator: In      # This policy ensures that the application pod can run only o
n a node that has the pod: nginx label.
                values:
                - nginx
      containers:
      - name: nginx-with-affinity
        image: nginx:1.7.9
        ports:
        - containerPort: 80
```

Result

In the preceding example, all application pods are scheduled to the xxx.xxx.0.74 node. This node has the pod: nignx label.



3.1.6.4. Storage

3.1.6.4.1. Overview

In the Container Service console, you can create volumes of other Apsara Stack services, enabling you to create stateful applications and use Apsara Stack disks and OSS to implement persistent storage.

Both static and dynamic volumes are supported. The following table shows how static and dynamic volumes are supported.

Apsara Stack storage	Static volume	Dynamic volume
Apsara Stack disk	You can use a static disk volume through either of the following methods: • Use a volume directly • Use a volume through a PV and PVC	Supported

Apsara Stack NAS	You can use a static NAS volume through either of the following methods:
	• Use a volume through the FlexVolume plug-in
	  ○ Use a volume directly
	  ○ Use a volume through a PV or PVC
	• Use a volume through the Kubernetes NFS driver
		Supported

Apsara Stack OSS	You can use a static OSS volume through either of the following methods: • Use a volume directly • Use a volume through a PV or PVC	Not supported

3.1.6.4.2. Mount disk volumes

You can mount disks as volumes.

Container Service allows you to mount disks as persistent volumes (PVs) in Kubernetes clusters.

Disks can be mounted to Kubernetes clusters as the following volume types:

- Statically provisioned disk volumes

  You can use statically provisioned disk volumes in the following ways:

  - Mount disks as volumes
  - Mount disk volumes by creating a PV and a persistent volume claim (PVC)

- Dynamically provisioned disk volumes

Usage notes

- You can mount a disk only to one pod.
- Before you mount a disk to a pod, you must create the disk and obtain its disk ID.

  The disk must meet the following capacity requirements:

  - If the disk is a basic disk, it must be at least 5 GiB in size.
  - If the disk is an ultra disk, it must be at least 20 GiB in size.
  - If the disk is a standard SSD, it must be at least 20 GiB in size.

- volumeId: the ID of the disk that you want to mount. The value must be the same as those of volumeName and PV Name.
- A disk can be mounted only to a node that is deployed in the same zone as the disk.
- Only pay-as-you-go disks can be mounted. If you change the billing method of an Elastic Compute Service (ECS)

instance in the cluster from pay-as-you-go to subscription, you cannot change the billing method of its disks to subscription. Otherwise, the disks cannot be mounted to the cluster.

Statically provisioned disk volumes

You can mount disks as volumes or by creating PVs and PVCs.

Prerequisites

A disk is created in the ECS console.

- **Mount a disk as a volume**

  Use the following *disk-deploy.yaml* file to create a pod:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-disk-deploy
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx-flexvolume-disk
        image: nginx
        volumeMounts:
          - name: "d-bp1j17ifxfasvts3tf40"
            mountPath: "/data"
      volumes:
        - name: "d-bp1j17ifxfasvts3tf40"
          flexVolume:
            driver: "alicloud/disk"
            fsType: "ext4"
            options:
              volumeId: "d-bp1j17ifxfasvts3tf40"
```

- **Mount disk volumes by creating a PV and a PVC**

  i. **Create a PV of the disk type**

  You can create a PV of the disk type in the Container Service console or by using a YAML file.

- **Create a PV by using a YAML file**

  Use the following `disk-pv.yaml` file to create a PV:

  > **Note** The PV name must be the same as the disk ID.

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: d-bp1j17ifxfasvts3tf40
  labels:
    failure-domain.beta.kubernetes.io/zone: cn-hangzhou-b
    failure-domain.beta.kubernetes.io/region: cn-hangzhou
spec:
  capacity:
    storage: 20Gi
  storageClassName: disk
  accessModes:
    - ReadWriteOnce
  flexVolume:
    driver: "alicloud/disk"
    fsType: "ext4"
    options:
      volumeId: "d-bp1j17ifxfasvts3tf40"
```

- **Create a PV in the console**

  a. Log on to the Container Service console.

  b. In the left-side navigation pane, click **Clusters**.

  c. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

  d. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.

  e. On the **Persistent Volumes** page, click **Create** in the upper-right corner.

  f. In the Create PV dialog box, set the parameters. PV parameters

Parameter	Description
PV Type	In this example, **Cloud Disk** is selected.
Volume Plug-in	Displays the supported storage drivers.
Access Mode	By default, ReadWriteOnce is selected.
Disk ID	Select a disk that is in the same region and zone as your cluster.
File System Type	Select the file system of the disk. Supported file systems are ext4, ext3, xfs, and vfat. Default value: ext4.
Label	Add labels to the PV.

  g. Click **Create**.

ii. **Create a PVC**

Use the following `disk-pvc.yaml` file to create a PVC:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-disk
spec:
  accessModes:
    - ReadWriteOnce
  storageClassName: disk
  resources:
    requests:
      storage: 20Gi
```

iii. **Create a pod**

Use the following *disk-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-alicloud-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: pvc-disk
          mountPath: "/data"
  volumes:
  - name: pvc-disk
    persistentVolumeClaim:
      claimName: pvc-disk
```

Dynamically provisioned disk volumes

To mount a disk as a dynamically provisioned volume, you must create a StorageClass of the disk type and specify the StorageClass in the storageClassName field of the PVC.

1. **Create a StorageClass**

```
kind: StorageClass
apiVersion: storage.k8s.io/v1beta1
metadata:
  name: alicloud-disk-common-hangzhou-b
provisioner: alicloud/disk
parameters:
  type: cloud_ssd
  regionid: cn-hangzhou
  zoneid: cn-hangzhou-b
```

Required parameters:

- provisioner: Set this parameter to alicloud/disk. This indicates that the Provisioner plug-in is used to create the StorageClass.
- type: Specify the disk type. Valid values: cloud, cloud_efficiency, cloud_ssd, and available. If you set this parameter to available, the system attempts to create a disk in the following order: ultra disk, standard SSD, and basic disk. The system stops trying until a disk is created.
- regionid: Specify the region of the disk.
- zoneid: Specify the zone of the disk.

2. **Create a PVC**

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: disk-common
spec:
  accessModes:
    - ReadWriteOnce
  storageClassName: alicloud-disk-common-hangzhou-b
  resources:
    requests:
      storage: 20Gi
---
kind: Pod
apiVersion: v1
metadata:
  name: disk-pod-common
spec:
  containers:
  - name: disk-pod
    image: nginx
    volumeMounts:
      - name: disk-pvc
        mountPath: "/mnt"
  restartPolicy: "Never"
  volumes:
    - name: disk-pvc
      persistentVolumeClaim:
        claimName: disk-common
```

Default options

By default, Kubernetes clusters support the following types of StorageClass:

- alicloud-disk-common: basic disk.
- alicloud-disk-efficiency: ultra disk.
- alicloud-disk-ssd: standard SSD.
- alicloud-disk-available: This option ensures high availability. The system attempts to create an ultra disk first. If no ultra disk is available in the specified zone, the system attempts to create a standard SSD. If no standard SSD is available, the system attempts to create a basic disk.

3. **Create a multi-instance StatefulSet by using a disk**

   We recommend that you use the volumeClaimTemplates parameter. This parameter allows the system to dynamically create PVCs and PVs. PVCs are associated with corresponding PVs.

```
apiVersion: v1
kind: Service
metadata:
  name: nginx
  labels:
    app: nginx
spec:
  ports:
  - port: 80
    name: web
  clusterIP: None
  selector:
    app: nginx
---
apiVersion: apps/v1beta2
kind: StatefulSet
metadata:
  name: web
spec:
  selector:
    matchLabels:
      app: nginx
  serviceName: "nginx"
  replicas: 2
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx
        ports:
        - containerPort: 80
          name: web
        volumeMounts:
        - name: disk-common
          mountPath: /data
  volumeClaimTemplates:
  - metadata:
      name: disk-common
    spec:
      accessModes: [ "ReadWriteOnce" ]
      storageClassName: "alicloud-disk-common"
      resources:
        requests:
          storage: 10Gi
```

3.1.6.4.3. Mount NAS volumes

Container Service allows you to mount Apsara File Storage NAS (NAS) file systems as persistent volumes (PVs) in Container Service clusters.

NAS file systems can be mounted to Kubernetes clusters as the following volume types:

- Statically provisioned NAS volumes

  You can statically provision NAS volumes in the following ways:

- Use the FlexVolume plug-in
  - Directly mount NAS file systems as volumes
  - Mount NAS file systems by creating a PV and a persistent volume claim (PVC)
- Use the Network File System (NFS) driver

- Dynamically provisioned NAS volumes

Prerequisites

A NAS file system is created in the NAS console and a mount target is added. The mount target is used to mount the NAS file system to the Kubernetes cluster. The NAS file system and your cluster are deployed in the same virtual private cloud (VPC).

Statically provisioned NAS volumes

You can use the FlexVolume plug-in provided by Alibaba Cloud or the NFS driver provided by Kubernetes to mount NAS file systems.

Use the FlexVolume plug-in

You can use the FlexVolume plug-in to directly mount a NAS file system as a volume. You can also mount a NAS file system by creating a PV and a PVC.

> **Note**
> - NAS is a shared storage service. You can mount a NAS file system to multiple pods.
> - server: the mount target of the NAS volume.
> - path: the directory to which the NAS volume is mount. You can specify a subdirectory. If the specified subdirectory does not exist, the system automatically creates the subdirectory.
> - vers: the version of the NFS protocol. Version 4.0 is supported.
> - mode: the access permissions on the directory of the NAS file system. If the root directory of the NAS file system is specified, you cannot modify the access permissions. If the NAS file system stores a large amount of data, the mounting operation may be time-consuming or even fail. Therefore, we recommend that you do not set the mode parameter.

Mount a NAS file system as a volume

Use the following `nas-deploy.yaml` file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-nas-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
        - name: "nas1"
          mountPath: "/data"
  volumes:
    - name: "nas1"
      flexVolume:
        driver: "alicloud/nas"
        options:
          server: "0cd8b4a576-grs79.cn-hangzhou.nas.aliyuncs.com"
          path: "/k8s"
          vers: "4.0"
```

Mount a NAS file system by creating a PV and a PVC

Step 1: Create a PV

You can create a PV in the Container Service console or by using a YAML file.

- Create a PV by using a YAML file.

  Use the following `nas-pv.yaml` file to create a PV:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: pv-nas
spec:
  capacity:
    storage: 5Gi
  storageClassName: nas
  accessModes:
    - ReadWriteMany
  flexVolume:
    driver: "alicloud/nas"
    options:
      server: "0cd8b4a576-uih75.cn-hangzhou.nas.aliyuncs.com"
      path: "/k8s"
      vers: "4.0"
```

- Create a PV in the console
  i. Log on to the Container Service console.
  ii. In the left-side navigation pane, click **Clusters**.
  iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
  iv. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.
  v. On the **Persistent Volumes** page, click **Create** in the upper-right corner.
  vi. In the Create PV dialog box, set the parameters.

Parameter	Description
PV Type	Select **NAS**.
Volume Name	Enter a name for the PV. The name must be unique in the cluster.
Volume Plug-in	By default, CSI is selected.
Capacity	Specify the capacity of the PV. The capacity of the PV cannot exceed the capacity of the disk.
Access Mode	By default, ReadWriteMany is selected.
Mount Target Domain Name	The domain name of the mount target that is used to mount the NAS file system to the cluster.

Parameter	Description
Subdirectory	Enter a subdirectory in the NAS file system. The subdirectory must start with a forward slash (/). If you set this parameter, the PV is mounted to the specified subdirectory. ■ If the specified subdirectory does not exist, the system automatically creates the subdirectory in the NAS file system. ■ If you do not set this parameter, the PV is mounted to the root directory of the NAS file system.
Version	The version of the NFS protocol. Version 3 and 4.0 are supported. By default, version 3 is used. We recommend that you use version 3.
Label	Add labels to the PV.

vii. Click **Create**.

Step 2: Create a PVC

Use the following *nas-pvc.yaml* file to create a PVC:

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-nas
spec:
  accessModes:
    - ReadWriteMany
  storageClassName: nas
  resources:
    requests:
      storage: 5Gi
```

Step 3: Create a pod

Use the following *nas-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-nas-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
          - name: pvc-nas
            mountPath: "/data"
  volumes:
  - name: pvc-nas
    persistentVolumeClaim:
        claimName: pvc-nas
```

Use the NFS driver

Step 1: Create a NAS file system

Log on to the NAS console. For more information about how to log on to the NAS console, see the *Create a NAS file system* chapter of the *NAS User Guide*.

> **Note** The NAS file system that you want to create and the Kubernetes cluster must be deployed in the same region.

In this example, the following mount target is used: `055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com`.

Step 2: Create a PV

You can create a PV in the console or by using a YAML file.

- **Create a PV by using a YAML template**

  Use the following *nas-pv.yaml* file to create a PV.

  Run the following command to create a PV that uses the NAS file system:

```
root@master # cat << EOF |kubectl apply -f -
apiVersion: v1
kind: PersistentVolume
metadata:
   name: nas
spec:
   capacity:
     storage: 8Gi
   accessModes:
     - ReadWriteMany
   persistentVolumeReclaimPolicy: Retain
   nfs:
     path: /
     server: 055f84ad83-ixxxx.cn-hangzhou.nas.aliyuncs.com
EOF
```

- **Create a PV by using the console**

  For more information, see Mount a NAS file system by creating a PV and a PVC.

Step 3: Create a PVC

Create a PVC and associate the PVC with the PV that is created in Step 2.

```
root@master # cat << EOF | kubectl apply -f -
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
     name: nasclaim
spec:
     accessModes:
       - ReadWriteMany
     resources:
       requests:
         storage: 8Gi
EOF
```

Step 4: Create a pod

Create an application to use the PV.

```
root@master # cat << EOF |kubectl apply -f -
apiVersion: v1
kind: Pod
metadata:
     name: mypod
spec:
     containers:
       - name: myfrontend
         image: registry.aliyuncs.com/spacexnice/netdia:latest
         volumeMounts:
         - mountPath: "/var/www/html"
           name: mypd
     volumes:
       - name: mypd
         persistentVolumeClaim:
           claimName: nasclaim
EOF
```

The NAS file system is mounted to the application that runs in the pod.

Dynamically provisioned NAS volumes

If you want to dynamically provision NAS volumes, you must install a driver plug-in and configure a NAS mount target.

Install the plug-in

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: alicloud-nas
provisioner: alicloud/nas
---
apiVersion: v1
kind: ServiceAccount
metadata:
  name: alicloud-nas-controller
  namespace: kube-system
---
kind: ClusterRoleBinding
apiVersion: rbac.authorization.k8s.io/v1beta1
metadata:
  name: run-alicloud-nas-controller
subjects:
  - kind: ServiceAccount
    name: alicloud-nas-controller
    namespace: kube-system
roleRef:
  kind: ClusterRole
  name: alicloud-disk-controller-runner
  apiGroup: rbac.authorization.k8s.io
---
kind: Deployment
apiVersion: extensions/v1beta1
metadata:
  name: alicloud-nas-controller
  namespace: kube-system
spec:
  replicas: 1
  strategy:
```

```
    type: Recreate
  template:
    metadata:
      labels:
        app: alicloud-nas-controller
    spec:
      tolerations:
      - effect: NoSchedule
        operator: Exists
        key: node-role.kubernetes.io/master
      - effect: NoSchedule
        operator: Exists
        key: node.cloudprovider.kubernetes.io/uninitialized
      nodeSelector:
         node-role.kubernetes.io/master: ""
      serviceAccount: alicloud-nas-controller
      containers:
        - name: alicloud-nas-controller
          image: registry.cn-hangzhou.aliyuncs.com/acs/alicloud-nas-controller:v1.8.4
          volumeMounts:
          - mountPath: /persistentvolumes
            name: nfs-client-root
          env:
            - name: PROVISIONER_NAME
              value: alicloud/nas
            - name: NFS_SERVER
              value: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
            - name: NFS_PATH
              value: /
      volumes:
        - name: nfs-client-root
          nfs:
            server: 0cd8b4a576-mmi32.cn-hangzhou.nas.aliyuncs.com
            path: /
```

Dynamically provision a NAS volume

```
apiVersion: apps/v1beta1
kind: StatefulSet
metadata:
  name: web
spec:
  serviceName: "nginx"
  replicas: 2
  volumeClaimTemplates:
  - metadata:
      name: html
    spec:
      accessModes:
        - ReadWriteOnce
      storageClassName: alicloud-nas
      resources:
        requests:
          storage: 2Gi
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:alpine
        volumeMounts:
        - mountPath: "/usr/share/nginx/html/"
          name: html
```

3.1.6.4.4. Mount OSS volumes

You can mount Object Storage Service (OSS) buckets as volumes in Kubernetes clusters.

You can mount OSS buckets in the following ways:

- Mount an OSS bucket as a volume.
- Mount an OSS bucket by creating a PV and a PVC.

Prerequisites

To mount an OSS bucket as a statically provisioned volume, you must create an OSS bucket in the OSS console.

Background

- OSS buckets can be mounted only as statically provisioned volumes.
- An OSS bucket can be shared by multiple pods.
- bucket: Only buckets can be mounted to a Kubernetes cluster. The subdirectories or files in a bucket cannot be mounted to a Kubernetes cluster.
- url: specifies the endpoint of the OSS bucket. The endpoint is the domain name that is used to mount the OSS bucket to the Kubernetes cluster.
- akId: specifies your AccessKey ID.
- akSecret: specifies your AccessKey secret.
- otherOpts: the custom parameters that are used to mount the OSS bucket. The parameters must be in the following format: `-o *** -o ***` .

> **Note** To mount an OSS bucket as a volume, you must create a Secret with your AccessKey pair when you deploy the flexvolume Service.

Mount an OSS bucket as a statically provisioned volume

- **Mount an OSS bucket as a volume**

  Use the following *oss-deploy.yaml* file to create a pod:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: nginx-oss-deploy
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx-flexvolume-oss
        image: nginx
        volumeMounts:
          - name: "oss1"
            mountPath: "/data"
      volumes:
        - name: "oss1"
          flexVolume:
            driver: "alicloud/oss"
            options:
              bucket: "docker"
              url: "oss-cn-hangzhou.aliyuncs.com"
              akId: ***
              akSecret: ***
              otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

- **Create a static PV and a PVC**

  i. **Create a PV**

  You can create a persistent volume (PV) in the Container Service console or by using a YAML file.

- **Create a PV by using a YAML file**

  Use the following *oss-pv.yaml* file to create a PV:

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: pv-oss
spec:
  capacity:
    storage: 5Gi
  accessModes:
    - ReadWriteMany
  storageClassName: oss
  flexVolume:
    driver: "alicloud/oss"
    options:
      bucket: "docker"
      url: "oss-cn-hangzhou.aliyuncs.com"
      akId: ***
      akSecret: ***
      otherOpts: "-o max_stat_cache_size=0 -o allow_other"
```

- **Create a PV in the Container Service console**

  a. Log on to the Container Service console.

  b. In the left-side navigation pane, click **Clusters**.

  c. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

  d. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volumes**.

  e. On the **Persistent Volumes** page, click **Create** in the upper-right corner.

f. In the Create PV dialog box, set the parameters.

Parameter	Description
PV Type	In this example, OSS is selected.
Name	Enter a name for the PV. The name must be unique in the cluster. In this example, pv-oss is used.
Volume Plug-in	By default, CSI is selected.
Capacity	Specify the capacity of the PV.
Access Mode	By default, ReadWriteMany is selected.
AccessKey ID and **AccessKey Secret**	The AccessKey pair that is required to access OSS buckets. To obtain your AccessKey pair, go to the Apsara Uni-manager Management Console, choose **Enterprise > Organizations**, click  on the right side of the organization. Then, click **AccessKey** and copy the AccessKey pair.
Optional Parameters	Enter custom parameters in the format of `-o ** * -o ***`.
Bucket ID	Enter the name of the OSS bucket that you want to mount. Click **Select Bucket**. In the dialog box that appears, select the OSS bucket that you want to mount and click **Select**.
Endpoint	**Internal Endpoint** is recommended.
Label	Add labels to the PV.

g. Click **Create**.

ii. **Create a PVC**

Use the following *oss-pvc.yaml* file to create a persistent volume claim (PVC):

```
kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: pvc-oss
spec:
  storageClassName: oss
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 5Gi
```

iii. **Create a pod**

Use the following *oss-pod.yaml* file to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
  name: "flexvolume-oss-example"
spec:
  containers:
    - name: "nginx"
      image: "nginx"
      volumeMounts:
          - name: pvc-oss
            mountPath: "/data"
  volumes:
  - name: pvc-oss
    persistentVolumeClaim:
        claimName: pvc-oss
```

Can I mount an OSS bucket as a dynamically provisioned volume?

No. Dynamically provisioned OSS volumes are not supported.

3.1.6.4.5. Create a PVC

This topic describes how to create a persistent volume claim (PVC).

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A persistent volume (PV) is created. In this example, a PV created from a disk is used. For more information, see Use Apsara Stack disks.

  By default, PVCs are associated with PVs that have the alicloud-pvname label. This label is added to all PVs that are created in the Container Service console. If a PV does not have this label, manually add the label to the PV before you can associate the PV with a PVC.

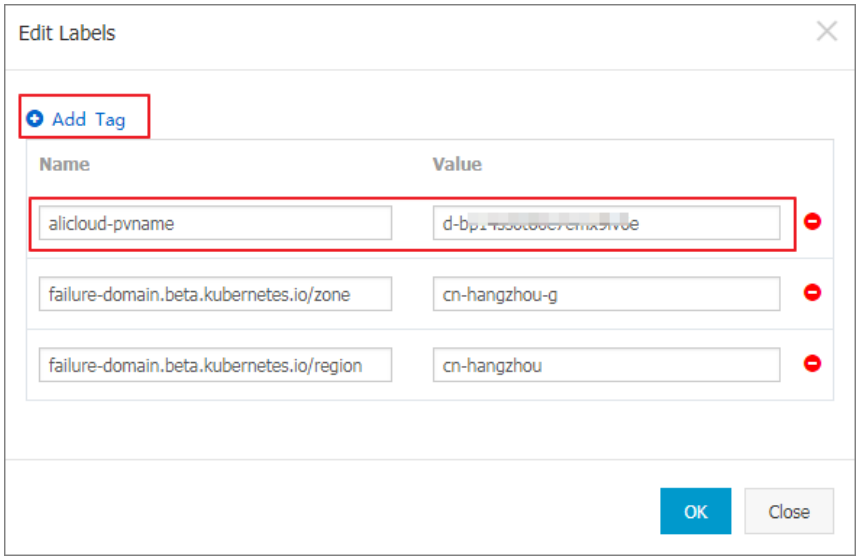
Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Volumes > Persistent Volume Claims**.
5. In the upper-right corner of the **Persistent Volume Claims** page, click **Create**.
6. In the **Create PVC** dialog box, set the parameters and click **Create**.
   - **PVC Type**: The PVC and PV must be of the same type. You can select Cloud Disk, NAS, and OSS.
   - **Name**: Enter the name of the PVC.
   - **Allocation Mode**: **Use StorageClass**, **Existing Volumes**, and **Create Volume** are supported. In this example, **Use StorageClass** or **Existing Volumes** is selected.
   - **Existing Storage Class**: Click **Select**. In the Select Storage Class dialog box, find the Storage Class that you want to use and click **Select** in the Actions column. This parameter is required only when you set Allocation Mode to **Use StorageClass**.
   - **Existing Volumes**: Click **Select PV**. In the Select PV dialog box, find the PV that you want to use and click **Select** in the Actions column. This parameter is required only when you set Allocation Mode to **Existing Volumes**.
   - **Capacity**: Specifies the capacity used by the PVC. The value cannot be larger than the total capacity of the associated PV.

- **Access Mode**: The default value is ReadWriteOnce. This parameter is required only when you set Allocation Mode to **Use StorageClass**.

> **Note** If your cluster has a PV that is not used, but you cannot find it in the **Select PV** dialog box, the reason may be that the PV does not have the alicloud-pvname label.

If you cannot find available PVs, click **Persistent Volumes** in the left-side navigation pane. On the Persistent Volumes page, find the PV that you want to use, click **Manage Labels** in the Actions column, and then add a label to the PV. On the Manage Labels dialog box, set the key of the label to alicloud-pvname and the value to the name of the PV. If the PV is created from a disk, the disk ID is used as the name of the PV.



7. Go to the Persistent Volume Claims page. You can find the newly created PVC in the list.

3.1.6.4.6. Use PVCs

You can use persistent volume claims (PVCs) to mount volumes for applications.

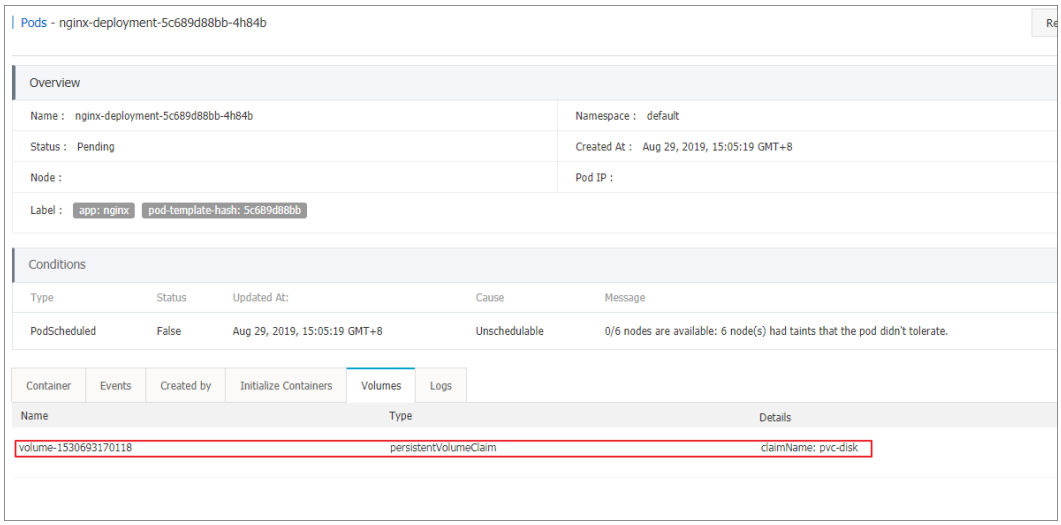
Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A PVC is created. In this example, a PVC named pvc-disk is created to mount a disk volume. For more information, see Create PVCs.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, click **Create from Image** in the upper-right corner.
6. On the **Basic Information** wizard page, specify the application name, number of replicas, type, and labels, select whether to synchronize the time zone from nodes to containers, and then click **Next**.
7. On the **Container** wizard page, select an image and configure volumes of the cloud storage type. You can select Cloud Disk, Apsara File Storage NAS (NAS), and Object Service Storage (OSS). In this example, select the PVC named pvc-disk and click **Next**. For more information, see Container configurations.
8. On the **Advanced** wizard page, create a Service for the test-nginx application and click **Create**.

9. On the **Complete** wizard page, click View Details to view detailed information about the application. You are redirected to the details page of the test-nginx application.
10. On the **Pods** tab, you can find the pods to which the application belongs. Select a pod and click **View Details** to view detailed information about the pod.
11. On the details page of the pod, click the **Volumes** tab. You can find that the pod is associated with the pvc-disk PVC.



3.1.6.5. Network management

3.1.6.5.1. Set access control for pods

This topic describes how to use network policies to control access between pods.

Prerequisites

You have created a Kubernetes cluster and selected the **Terwaynetwork plug-in**. For more information, see Create a Kubernetes cluster.

Context

You can declare network policies to control access between pods and thus prevent applications from interfering each other.

Procedure

For more information about standard Kubernetes network policies, see Network policies.

1. Create a pod that runs as a server and attach `label run=nginx` to the pod. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

```
apiVersion: v1
kind: Pod
metadata:
  name: server
  labels:
    run: nginx
spec:
  containers:
    - name: nginx
      image: registry.acs.intranet.env22.com/nginx:1.8
```

2. Create a network policy. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

```
kind: NetworkPolicy
apiVersion: networking.k8s.io/v1
metadata:
  name: access-nginx
spec:
  podSelector:
    matchLabels:
      run: nginx # Apply the network policy to pods with the run=nginx label
  ingress:
  - from:
    - podSelector:
        matchLabels:
          access: "true" # Only pods with the access=true label are accessible
```

3. Use the *client.yaml* and *client-label* files to create two pods that run as clients.

   One pod has the required label and the other does not.

   i. Create the *client.yaml* and *client-label* files with the following contents respectively.

```
# This pod has no label
apiVersion: v1
kind: Pod
metadata:
  name: client
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/busybox
      command: ["sh", "-c", "sleep 200000"]
```

```
# This pod has the label
apiVersion: v1
kind: Pod
metadata:
  name: client-label
  labels:
    access: "true"
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/busybox
      command: ["sh", "-c", "sleep 200000"]
```

ii. Run the following commands to create these pods:

```
kubectl apply -f client.yaml
kubectl apply -f client-label.yaml
```

You can see that only the pod with the required label can access the server.

3.1.6.5.2. Set bandwidth limits for pods

This topic describes how to limit the bandwidth of inbound and outbound traffic that flows through a pod.

Prerequisites

You have created a Kubernetes cluster and selected the **Terwaynetwork plug-in**. For more information, see Create a Kubernetes cluster.

Context

Throttling pods helps prevent performance degradation of the host or other workloads when certain pods occupy excessive resources.

Method

You can use the `k8s.aliyun.com/ingress-bandwidth` and `k8s.aliyun.com/egress-bandwidth` annotations for pod throttling.

- `k8s.aliyun.com/ingress-bandwidth`: limits the pod inbound bandwidth.
- `k8s.aliyun.com/egress-bandwidth`: limits the pod outbound bandwidth.
- The bandwidth limit is measured in m and k, which represent Mbit/s and Kbit/s respectively.

Procedure

1. Create a pod that runs as a server in the console. For more information, see Create an application from an orchestration template.

   The sample YAML file is as follows:

   ```
   apiVersion: v1
   kind: Pod
   metadata:
     name: server
     annotations:
       k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
       k8s.aliyun.com/egress-bandwidth: 10m
   spec:
     containers:
       - name: nginx
         image: registry.acs.intranet.env22.com/nginx:1.8
   ```

2. Run the kubectl exec command to connect to the pod. To verify that pod throttling is effective, run the following commands to create a file on the pod. Assume that the IP address of the pod created in step 1 is 172.16.XX.XX.

   ```
   cd /usr/share/nginx/html
   dd if=/dev/zero of=bigfile bs=1M count=1000
   ```

3. Use the *client-deploy.yaml* file to create a pod that runs as a client.

i. Create the *client-deploy.yaml* file with the following content:

```
apiVersion: v1
kind: Pod
metadata:
  name: client
  annotations:
     k8s.aliyun.com/ingress-bandwidth: 10m # Set the inbound bandwidth limit to 10 Mbit/s
     k8s.aliyun.com/egress-bandwidth: 10m
spec:
  containers:
    - name: busybox
      image: registry.acs.intranet.env22.com/acs/netdia
      command: ["sh", "-c", "sleep 200000"]
```

ii. Run the following command to create the pod:

```
kubectl apply -f client-deploy.yaml
```

4. Run the following command to check whether bandwidth is limited:

```
kubectl exec -it client sh
```

3.1.6.5.3. Work with Terway

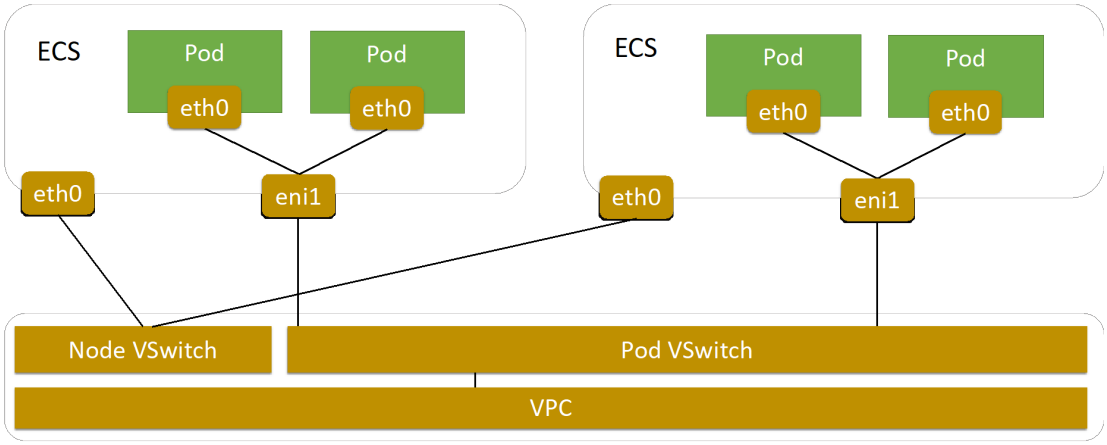
Terway is an open source Container Network Interface (CNI) plug-in developed by Alibaba Cloud. Terway works with Virtual Private Cloud (VPC) and allows you to use standard Kubernetes network policies to regulate how containers communicate with each other. You can use Terway to enable internal communication within a Kubernetes cluster. This topic describes how to use Terway.

Context

Terway is a network plug-in developed by Alibaba Cloud for Container Service. Terway allows you to set up networks for pods by associating Alibaba Cloud elastic network interfaces (ENIs) with the pods. Terway also allows you to use standard Kubernetes network policies to regulate how containers communicate with each other. In addition, Terway is compatible with Calico network polices.

In a cluster that has Terway installed, each pod has a separate network stack and is assigned a separate IP address. Pods on the same Elastic Compute Service (ECS) instance communicate with each other by forwarding packets inside the ECS instance. Pods on different ECS instances communicate with each other through ENIs in the VPC where the ECS instances are deployed. This improves communication efficiency because no tunneling technologies such as Virtual Extensible Local Area Network (VXLAN) are required to encapsulate packets.

How Terway works



Comparison between Flannel and Terway

When you create a Kubernetes cluster, you can choose one of the following network plug-ins:

- Terway: a network plug-in developed by Alibaba Cloud for Container Service. Terway allows you to assign ENIs to containers and use standard Kubernetes network policies to regulate how containers communicate with each other. Terway also supports bandwidth throttling on individual containers. Terway uses flexible IP Address Management (IPAM) policies to allocate IP addresses to containers. This avoids IP address waste. If you do not want to use network policies, you can select Flannel as the network plug-in. Otherwise, we recommend that you select Terway.
- Flannel: an open source CNI plug-in, which is simple and stable. You can use Flannel with VPC of Alibaba Cloud. This allows your clusters and containers to run in high-performance and stable networks. However, Flannel provides only basic features. It does not support standard Kubernetes network policies. For more information, see Flannel.

Item	Terway	Flannel
Performance	The IP address of each pod in a Kubernetes cluster is assigned from the CIDR block of the VPC where the cluster is deployed. Therefore, you do not need to use the Network Address Translation (NAT) service to translate IP addresses. This avoids IP address waste. In addition, each pod in the cluster can use an exclusive ENI.	Flannel works with VPC of Alibaba Cloud. The CIDR block of pods that you specify must be different from that of the VPC where the cluster is deployed. Therefore, the NAT service is required and some IP addresses may be wasted.
Security	Terway supports network policies.	Flannel does not support network policies.
IP address management	Terway allows you to assign IP addresses on demand. You do not have to assign CIDR blocks by node. This avoids IP address waste.	You can only assign CIDR blocks by node. In large-scale clusters, a great number of IP addresses may be wasted.
SLB	Server Load Balancer (SLB) directly forwards network traffic to pods. You can upgrade the pods without service interruption.	SLB forwards network traffic to the NodePort Service. Then, the NodePort Service routes the network traffic to pods.

Considerations

- To use the Terway plug-in, we recommend that you use ECS instances of higher specifications and newer types, such as ECS instances that belong to the g5 or g6 instance family with at least eight CPU cores. For more information, see the *Instance families* chapter of *ECS User Guide*.
- The maximum number of pods that each node supports is based on the number of ENIs assigned to the node.
  - Maximum number of pods supported by each shared ENI = (Number of ENIs supported by each ECS instance - 1) × Number of private IP addresses supported by each ENI
  - Maximum number of pods supported by each exclusive ENI = Number of ENIs supported by each ECS instance - 1

Step 1: Plan CIDR blocks

When you create a Kubernetes cluster, you must specify a VPC, vSwitches, the CIDR block of pods, and the CIDR block of Services. If you want to install the Terway plug-in, you must first create a VPC and two vSwitches in the VPC. The two vSwitches must be created in the same zone.

You can assign the following CIDR blocks for a cluster that uses Terway.

- VPC CIDR block: 192.168.0.0/16
- vSwitch CIDR block: 192.168.0.0/19

- CIDR block of pod vSwitch: 192.168.32.0/19
- Service CIDR block:172.21.0.0/20

> **Note**
> - IP addresses within the CIDR block of the vSwitch are assigned to nodes.
> - IP addresses within the CIDR block of the pod vSwitch are assigned to pods.

The following example describes how to create a VPC and two vSwitches. The CIDR blocks in the preceding section are assigned in this example.

1. Log on to the VPC console.

   > **Note** For more information, see the *Log on to the VPC console* chapter of *VPC*.

2. Create a VPC.
   i. In the top navigation bar, select the region where you want to create the VPC.
   ii. On the **VPCs** page, click **Create VPC**.

iii. On the **Create VPC** page, set the following parameters and click **Submit**.

Parameter	Description
Organization	Select the organization to which the VPC belongs.
Resource Set	Select the resource set to which the VPC belongs.
Region	Select the region where you want to deploy the VPC.
Sharing Scope	Select the sharing scope of the VPC. ■ **Current Resource Set**: Only the administrator of the current resource set can use the VPC to create resources. ■ **Current Organization and Subordinate Organization**: Only the administrators of the current organization and its subordinate organization can create resources for the shared VPC. ■ **Current Organization**: Only the administrator of the current organization can use create resources for the shared VPC.
VPC Name	Enter a name for the VPC. In this example, vpc_192_168_0_0_16 is used. The name must be 2 to 128 characters in length, and can contain letters, digits, underscores (_), and hyphens (-). The name must start with a letter and cannot start with `http://` or `https://`.
IPv4 CIDR Block	Select an IPv4 CIDR block for the VPC. In this example, 192.168.0.0/16 is specified. **Note** After a VPC is created, the IPv4 CIDR block of the VPC cannot be modified.
IPv6 CIDR Block	Specify whether to assign an IPv6 CIDR block. ■ **Do Not Assign**: The system does not assign an IPv6 CIDR block to the VPC. ■ **Assign**: An IPv6 CIDR block is automatically assigned to the VPC. If you set this parameter to Assign, the system automatically creates a free IPv6 gateway for this VPC, and assigns an IPv6 CIDR block with the subnet mask /56, such as 2xx1: db8::/56. By default, IPv6 addresses can be used to communicate within only private networks. If you want to allow an instance assigned with an IPv6 address to access the Internet or be accessed by IPv6 clients over the Internet, you must purchase an Internet bandwidth plan for the IPv6 address. For more information, see the **Activate IPv6 Internet bandwidth** section of the **Manage IPv6 Internet bandwidth** topic of the *IPv6 gateway user guide*.
Description	Enter a description for the VPC. The description must be 2 to 256 characters in length, and can contain digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). It must start with a letter and cannot start with `http://` or `https://`.

3. Create vSwitches.
   i. In the left-side navigation pane, click **VSwitches**.
   ii. Select the region of the VPC in which you want to create a vSwitch.
   iii. On the **VSwitches** page, click **Create VSwitch**.
   iv. On the **Create vSwitch** page, set the following parameters and click **Submit**.

> **Note** Make sure that the two vSwitches are in the same zone.

Parameter	Description
Organization	Select the organization to which the vSwitch belongs.
Resource Set	Select the resource set to which the vSwitch belongs.
Region	Select the region where you want to deploy the vSwitch.
Zone	Select the zone to which the vSwitch belongs. In a VPC, each vSwitch can be deployed in only one zone. You cannot deploy a vSwitch across zones. However, you can deploy cloud resources in vSwitches that belong to different zones to achieve cross-zone disaster recovery. **Note** A cloud instance can be deployed in only one vSwitch.
Sharing Scope	Select the sharing scope of the vSwitch. ■ **Current Resource Set**: Only the administrator of the current resource set can create resources in the shared vSwitch. ■ **Current Organization and Subordinate Organization**: Only the administrators of the current organization and its subordinate organizations can create resources in the shared vSwitch. ■ **Current Organization**: Only the administrator of the current organization can create resources in the shared vSwitch.
VPC	Select the VPC for which you want to create the vSwitch.
Dedicated for Out-of-cloud Physical Machines	Specify whether the vSwitch to be created is dedicated for bare-metal instances. For more information about bare-metal instances, see the **VPC bare-metal instance features** topic in *BMS User Guide*.
vSwitch Name	Enter a name for the vSwitch. In this example, node_switch_192_168_0_0_19 is used. The name must be 2 to 128 characters in length and can contain digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). It must start with a letter and cannot start with `http://` or `https://`.
IPv4 CIDR Block	Specify an IPv4 CIDR block for the vSwitch. In this example, 192.168.0.0/19 is used.
IPv6 CIDR Block	Specify an IPv6 CIDR block for the vSwitch. ■ You must check whether IPv6 is enabled for the specified VPC. If IPv6 is disabled, you cannot assign an IPv6 CIDR block to the vSwitch. ■ If IPv6 is enabled, you can enter a decimal number ranging from 0 to 255 to define the last 8 bits of the IPv6 CIDR block of the vSwitch. For example, if the IPv6 CIDR block of the VPC is 2xx1:db8::/64, specify 255 to define the last 8 bits of the IPv6 CIDR block. In this case, the IPv6 CIDR block of the vSwitch is 2xx1:db8:ff::/64. ff is the hexadecimal value of 255.

Parameter	Description
Description	Enter a description for the vSwitch. The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), hyphens (-), periods (.), colons (:), and commas (,). The name must start with a letter and cannot start with `http://` or `https://`.

4. Repeat Step to create a pod vSwitch. Set the name of the pod vSwitch to **pod_switch_192_168_32_0_19** and IPv4 CIDR Block to **192.168.32.0/19**.

Step 2: Set up networks for a cluster that uses Terway

To install Terway in a cluster and set up networks for the cluster, set the following parameters.

> **Note** A Kubernetes cluster is used as an example to show how to set up networks for a cluster that uses Terway as the network plug-in. For more information about how to create a Kubernetes cluster, see Create a Kubernetes cluster.

- **VPC**: Select the VPC created in Step 1: Plan CIDR blocks.
- **VSwitch**: Select the vSwitch created in Step 1: Plan CIDR blocks.
- **Network Plug-in**: Select **Terway**.
- **Pod VSwitch**: Select the pod vSwitch created in Step 1: Plan CIDR blocks.
- **Service CIDR**: Use the default settings.

3.1.6.6. Namespaces

3.1.6.6.1. Create a namespace

You can create a namespace in the Container Service console.

Prerequisites

A Kubernetes cluster is created.

Context

In a Kubernetes cluster, you can use namespaces to create multiple virtual spaces. When a large number of users share a cluster, you can use namespaces to divide different workspaces and allocate cluster resources to different tasks. You can also use resource quotas to allocate resources to each namespace.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. On the **Namespace** page, click **Create** in the upper-right corner.
6. In the **Create Namespace** dialog box, configure the namespace.

   Create a namespace

Parameter	Description

Parameter	Description
Name	Enter a name for the namespace. In this example, test is entered. The name must be 1 to 63 characters in length and can contain digits, letters, and hyphens (-). It must start and end with a letter or digit.
Label	**Label**: Add one or more labels to the namespace. Labels are used to identify namespaces. For example, you can label a namespace as one used in the test environment. To add a label, enter a key and a value and click **Add** in the Actions column.

7. Click **OK**.
   You can find the namespace that you created on the Namespace page.

3.1.6.6.2. Set resource quotas and limits

You can set resource quotas and limits for a namespace in the Container Service console.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.
- You are connected to a master node of the cluster. For more information, see Connect to a Kubernetes cluster through kubectl.

Context

By default, a running pod uses the CPU and memory resources of a node without limit. This means that pods can compete for computing resources of a cluster. As a result, the pods in a namespace may exhaust all of the computing resources.

Namespaces can be used as virtual clusters to serve multiple purposes. We recommend that you set resource quotas for namespaces.

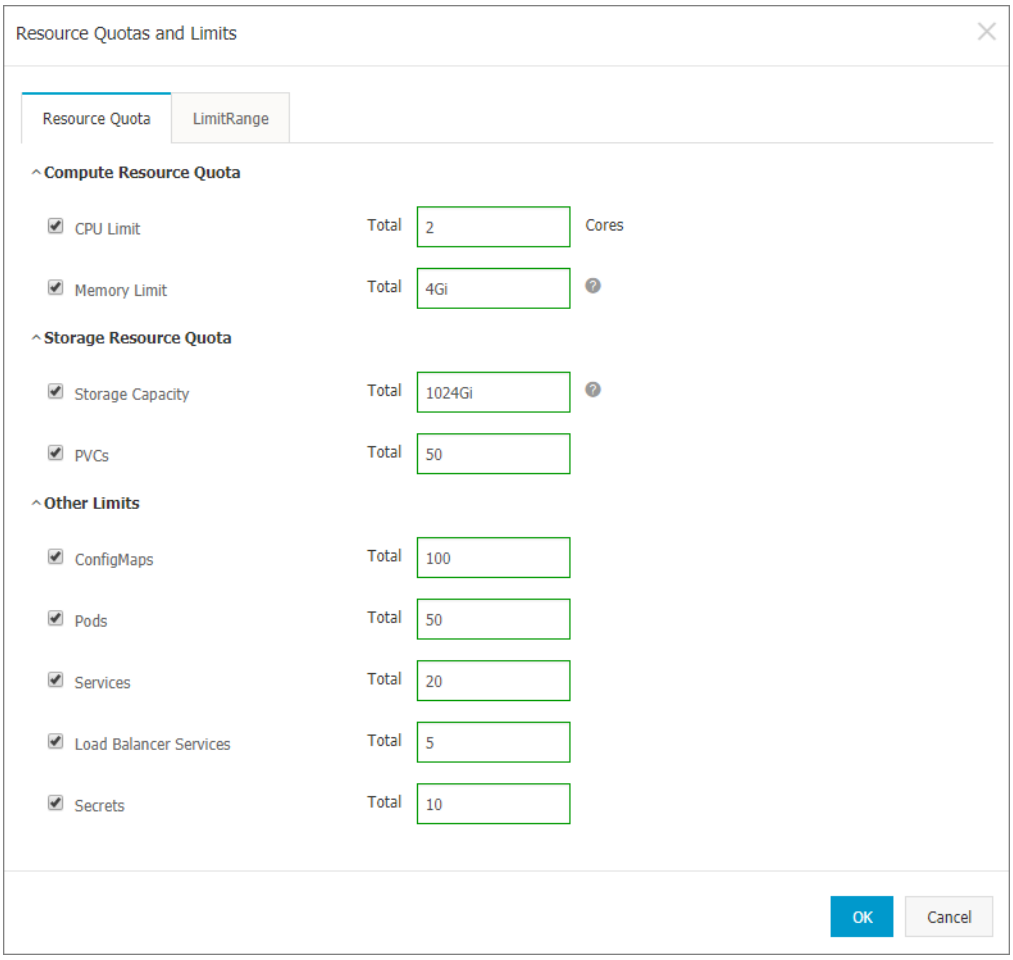
For a namespace, you can set quotas on resources such as CPU, memory, and pod quantity. For more information, see Resource Quotas.

Procedure

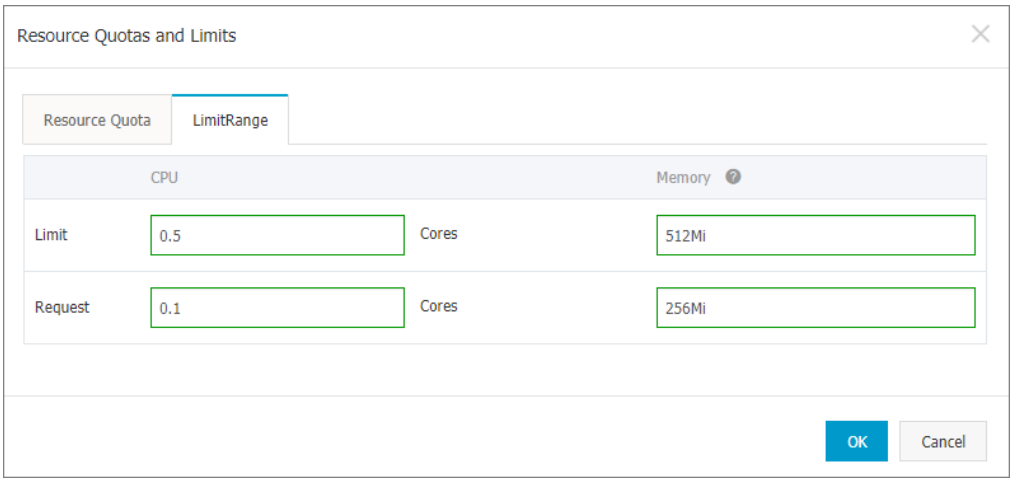
1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to manage and click **Resource Quotas and Limits** in the **Actions** column.
6. In the dialog box that appears, set resource quotas and default resource limits.

> **Note** After you set CPU and memory quotas for a namespace, you must specify CPU and memory limits when you create a pod. You can also set the default resource limits for the namespace. For more information, see Resource Quotas.

i. Set resource quotas for the namespace.



ii. You can set resource limits and resource requests for containers in the namespace. This enables you to control the amount of resources consumed by the containers. For more information, see https://kubernetes.io//memory-default-namespace/.



7. After you set resource quotas and limits, connect to a master node of the cluster and run the following commands to query the resource configurations of the namespace.

```
# kubectl get limitrange,ResourceQuota -n test
NAME AGE
limitrange/limits 8m
NAME AGE
resourcequota/quota 8m
# kubectl describe limitrange/limits resourcequota/quota -n test
Name: limits
Namespace: test
Type Resource Min Max Default Request Default Limit Max Limit/Request Ratio
---- -------- --- --- --------------- ------------- -----------------------
Container cpu - - 100m 500m -
Container memory - - 256Mi 512Mi -
Name: quota
Namespace: test
Resource Used Hard
-------- ---- ----
configmaps 0 100
limits.cpu 0 2
limits.memory 0 4Gi
persistentvolumeclaims 0 50
pods 0 50
requests.storage 0 1Ti
secrets 1 10
services 0 20
services.loadbalancers 0 5
```

3.1.6.6.3. Modify a namespace

You can modify an existing namespace.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.

Context

When you modify a namespace, you can add, delete, or modify the labels that are added to the namespace based on your requirements.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to modify and click **Edit** in the **Actions** column.
6. In the **Edit Namespace** dialog box, find the label that you want to modify and click **Edit** to modify the label. For example, you can change the key-value pair of the label to `env:test-V2`. Then, click **Save**.
7. Click **OK**.

   You can find that the labels of the namespace on the Namespace page are updated.

3.1.6.6.4. Delete a namespace

You can delete namespaces that are no longer in use.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A sample namespace named **test** is created. For more information, see Create a namespace.

Context

> **Note** When you delete a namespace, all resource objects under the namespace are deleted. Proceed with caution.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, click **Namespaces and Quotas**.
5. Find the namespace that you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

   Return to the Namespace page. You can find that the namespace is deleted. Resource objects in the namespace are also deleted.

3.1.6.7. Applications

3.1.6.7.1. Create an application from an image

You can use an image to create an NGINX application that is accessible over the Internet.

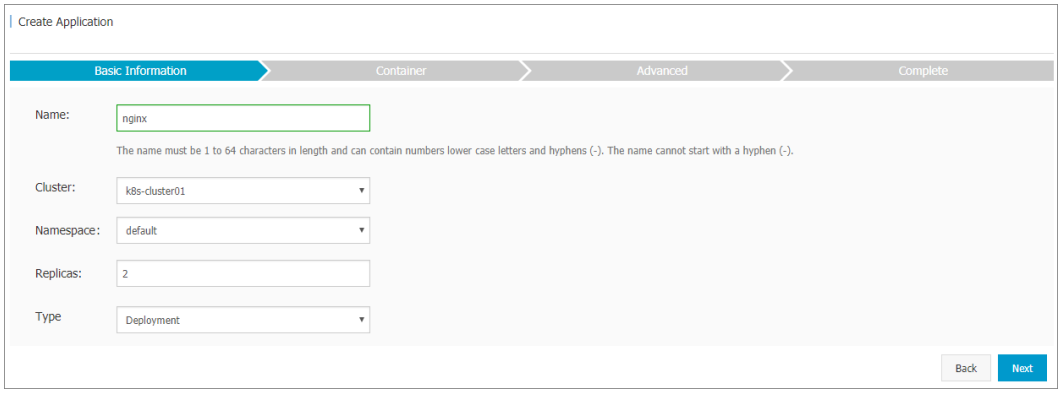
Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- Your Kubernetes cluster is accessible over the Internet.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Image** in the upper-right corner.
6. On the page that appears, set the following parameters: **Name**, **Cluster**, **Namespace**, **Replicas**, and **Type**. Then, select **Synchronize Timezone**. Click **Next**.

   If you do not set the **Namespace** parameter, the default namespace is used.



7. Configure containers.

> **Note** You can configure a pod that contains one or more containers for the application.

i. Configure basic settings.

Basic settings of the container

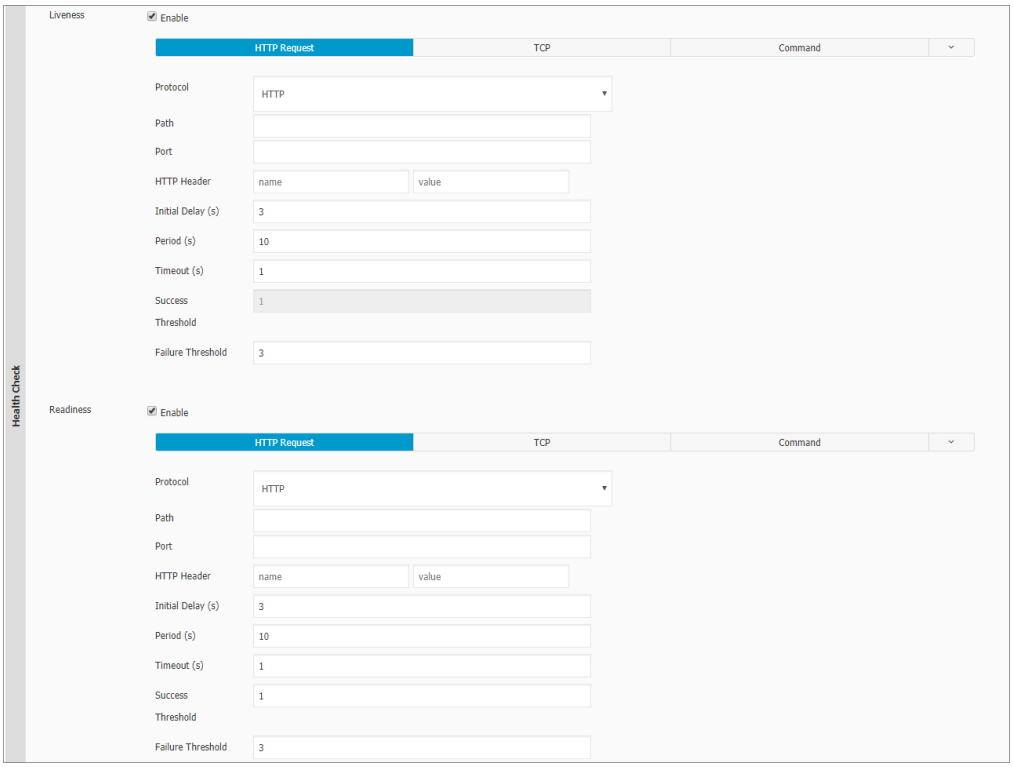
Parameter	Description
Image Name	You can click **Select Image** to select an image in the dialog box that appears and click **OK**. In this example, NGINX is selected. You can also specify an image in a private registry. Use the following format to specify an image in a private registry: `domainname/namespace/imagename` .
Image Version	You can click **Select Image Version** to select a version. If you do not specify the image version, the latest version is used.
Always	Container Service caches images to improve the efficiency of application deployment. When Container Service deploys the application, if the specified image version is the same as the cached image version, the cached image is used. Therefore, when you update the application code, if you do not change the image version for reasons such as to support the upper-layer workloads, the cached image is used to deploy the application. After you select the Always option, Container Service always pulls the latest image from the repository. This ensures that the latest image and code are used to deploy the application.
Set Image Pull Secret	Click Set Image Pull Secret to set the image Secret. The Secret is required if you need to access a private repository.
Resource Limit	The upper limits of CPU and memory resources that can be used by this application. This prevents the application from occupying excessive resources. The unit of CPU resources is Core. The unit of memory is MiB.
Required Resources	The amount of CPU and memory resources that are reserved for this application. These resources are exclusive to the container. This prevents other services or processes from occupying the resources of the application.
Container Start Parameter	**stdin**: Pass stdin to the container. **tty**: Stdin is a TTY. Typically, these two check boxes are both selected. This allows you to associate the terminal (tty) with the standard inputs (stdin) of the container. For example, an interactive program can obtain standard inputs from users and then display the inputs on the terminal.
Init Container	When this check box is selected, the system creates an Init Container that contains useful tools. For more information, see .

ii. (Optional)Set environment variables.

You can set environment variables in key-value pairs for pods. Environment variables are used to apply pod configurations to containers. For more information, see Pod variable.

iii. (Optional)Configure the **Health Check** settings.

Health check settings include liveness and readiness probes. Liveness probes determine when to restart the container. Readiness probes indicate whether the container is ready to accept network traffic. For more information about health checks, see .



Request type	Description

Request type	Description
HTTP	Sends an HTTP GET request to the container. Supported parameters: ■ Protocol: HTTP or HTTPS. ■ Path: the requested path on the server. ■ Port: the container port that you want to open. Enter a port number from 1 to 65535. ■ HTTP Header: the custom headers in the HTTP request. Duplicate headers are allowed. Key-value pairs are supported. ■ Initial Delay (s): The **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 3. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.
TCP	Sends a TCP socket to the container. Kubelet attempts to open the socket on the specified port. If the connection can be established, the container is considered healthy. Otherwise, the container is considered unhealthy. You can set the following parameters: ■ Port: the container port that you want to open. Enter a port number from 1 to 65535. ■ Initial Delay (s): the **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 15. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

Request type	Description
Command	Runs a probe command in the container to check the health status of the container. You can set the following parameters: ■ Command: the probe command that is run to check the health status of the container. ■ Initial Delay (s): the **initialDelaySeconds** field. The time (in seconds) to wait before performing the first probe after the container is started. Default value: 5. ■ Period (s): the **periodSeconds** field. The intervals (in seconds) between two adjacent probes. Default value: 10. Minimum value: 1. ■ Timeout (s): the **timeoutSeconds** field. The time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

iv. Configure the lifecycle of the container.

You can set the following parameters to configure the lifecycle of the container in the Start, Post Start, and Pre Stop fields. For more information, see https://kubernetes.io/docs/tasks/configure-pod-container/attach-handler-lifecycle-event/.

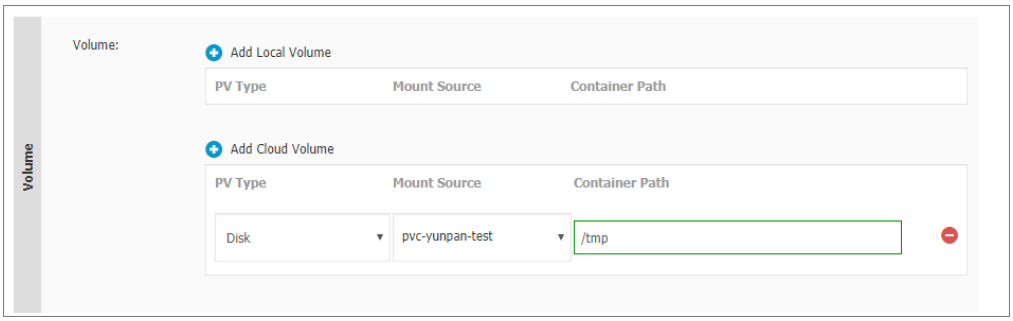
- **Start**: the pre-start command and parameter.
- **Post Start**: the post-start command.
- **Pre Stop**: the pre-stop command.

v. (Optional)Configure volumes.

Local storage and cloud storage are supported.

- **Local Storage**: supports hostPath, ConfigMap, Secret, and emptyDir. The specified volume is mounted to a path in the container. For more information, see Volumes.
- **Cloud Storage**: supports disks, Apsara File Storage NAS (NAS) volumes, and Object Storage Service (OSS) volumes.

In this example, a persistent volume (PV) is created from a disk and mounted to the */tmp* path in the container. Data generated in this path is stored in the disk.



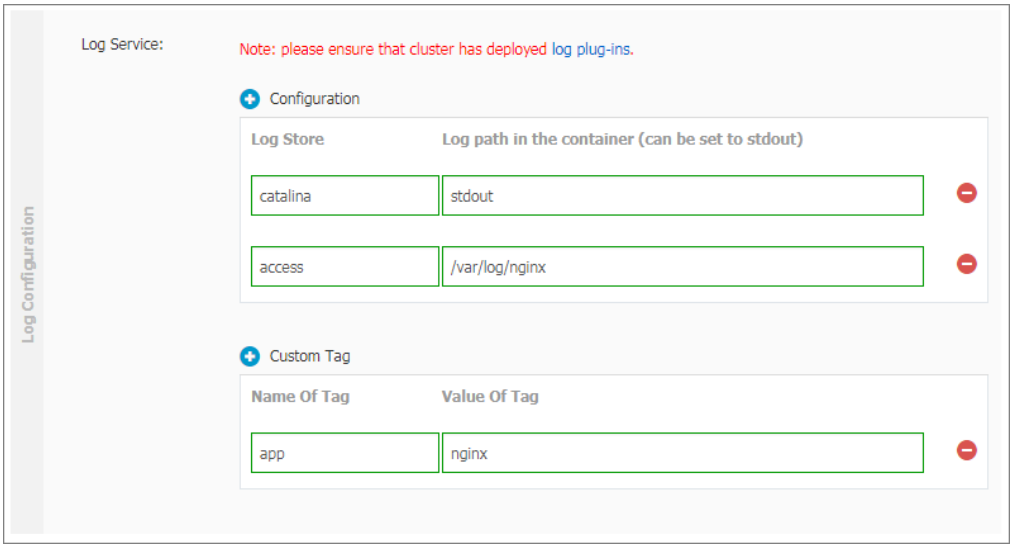
vi. (Optional)Configure **Log Service**. You can specify log collection configurations and custom tags.

> **Note** Make sure that the Log Service agent is installed in the cluster.

You can configure the following log collection settings:

- **Logstore**: Create a Logstore in Log Service to store the collected log data.
- **Log Path in Container**: Specify stdout or a path to collect log data.
  - **stdout**: specifies that the stdout files are collected.
  - **Text Logs**: specifies that the log data in the specified path of the container is collected. In this example, the log data in the */var/log/nginx* path is collected. Wildcard characters can be used in the path.

You can also add custom tags. Tags are added to the log data of the container when the log data is collected. Log data with tags is easier to aggregate and filter.

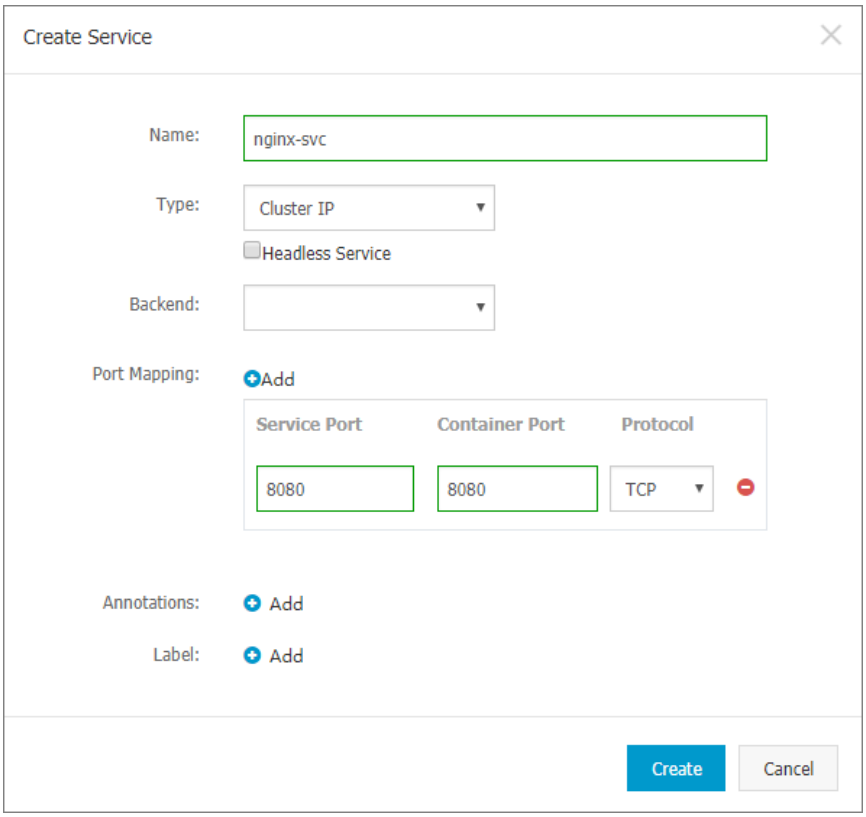


8. After you complete the configurations of the container, click **Next**.
9. Configure advanced settings. Configure the **Access Control** settings.

You can configure the method to expose pods and click **Create**. In this example, a ClusterIP Service and an Ingress are created to enable Internet access to the NGINX application.

> **Note**
>
> You can configure the following access control settings based on your business requirements:
>
> - Internal applications: For applications that run inside the cluster, you can create a ClusterIP Service or a NodePort Service to enable internal communication.
> - External applications: For applications that need to be accessed over the Internet, you can configure access control settings by using one of the following methods:
>   - Create a LoadBalancer Service: When you create a LoadBalancer Service, a Server Load Balancer (SLB) instance is associated with the Service and is created to expose applications to the Internet.
>   - Create a ClusterIP Service or a NordPort Service, and then create an Ingress: When you use this method, an Ingress is created to expose applications to the Internet. For more information, see .

i. To create **Services**, click **Create** in the Access Control section. In the dialog box that appears, set the parameters, and then click **Create**.



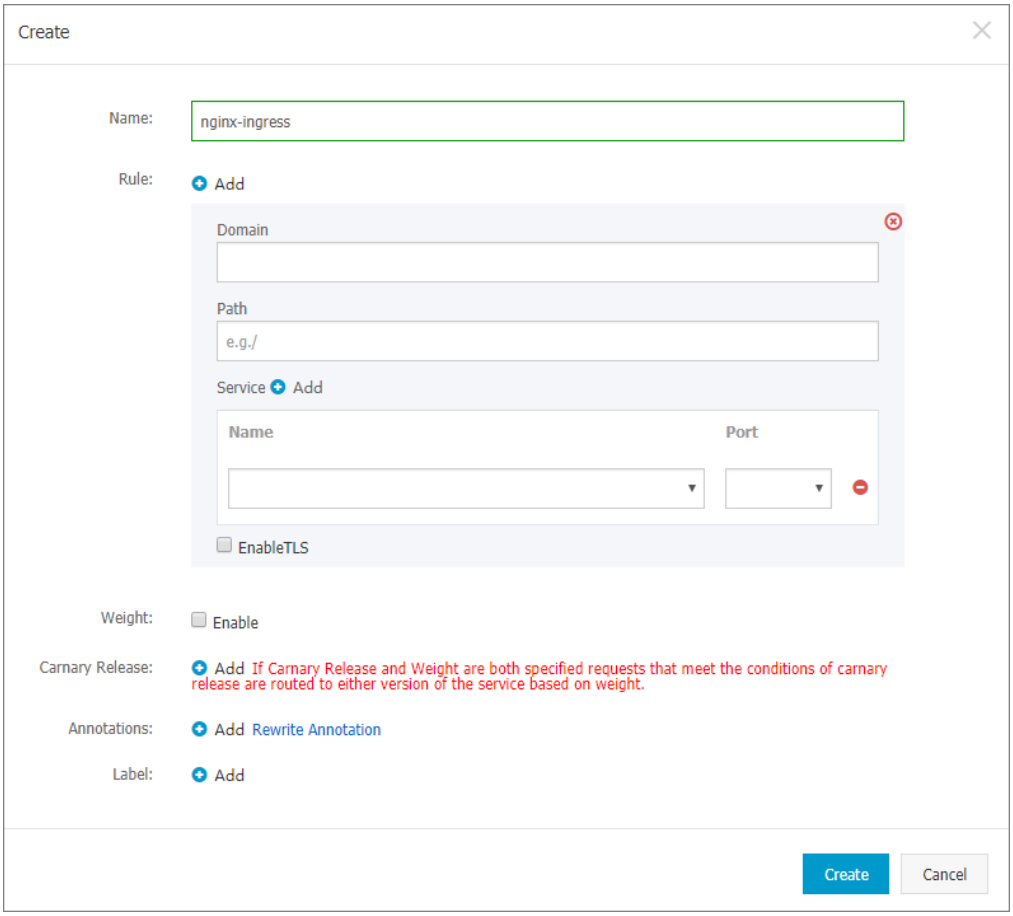
Parameter	Description
Name	Enter a name for the Service. Default value: `applicationname-svc`.

Parameter	Description
Type	Select one from the following three Service types: ■ Cluster IP: creates a ClusterIP Service. This type of Service exposes applications through an internal IP address of the cluster. If you select this type, applications can be accessed only within the cluster. ■ Node Port: creates a NordPort Service. This type of Service exposes applications through the IP address and static port on each node. A NodePort Service can be used to route requests to a ClusterIP Service. The system automatically creates the ClusterIP Service. You can access a NodePort Service from outside the cluster by requesting `<NodeIP>:<NodePort>`. ■ Server Load Balancer: creates a LoadBalancer Service. This type of Service exposes applications through an SLB instance, which supports Internet access or internal access. The SLB instance can route requests to NodePort and ClusterIP Services.
Port Mapping	Specify a Service port and a container port. If the **Type** parameter is set to Node Port, you must specify a node port to avoid port conflicts. TCP and UDP protocols are supported.
Annotations	Add annotations to the Service. SLB parameters are supported. For more information, see Access services by using SLB.
Label	Add one or more labels to the Service. The labels are used to identify the Service.

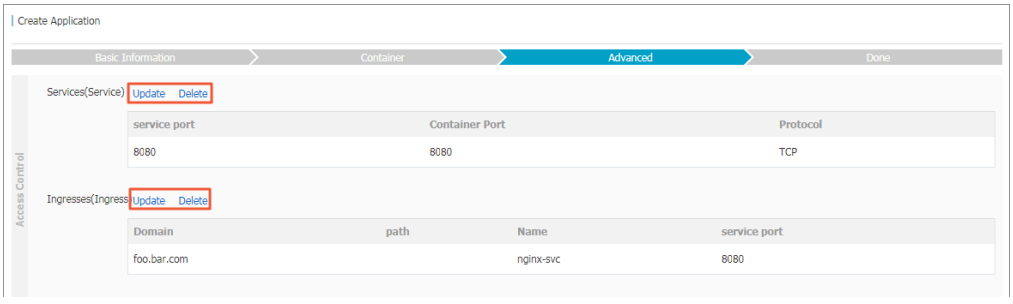
ii. To create **Ingresses**, click **Create** in the Access Control section. Configure Ingress rules in the dialog box that appears, and then click **Create**. For more information about Ingress configuration, see Ingress configurations.

When you create an application from an image, you can create an Ingress for only one Service. In this example, a virtual hostname is specified as the test domain name. You must add a mapping rule to the hosts file for this domain name, as shown in the following code block. In actual scenarios, use a domain name that has obtained an Internet Content Provider (ICP) number.

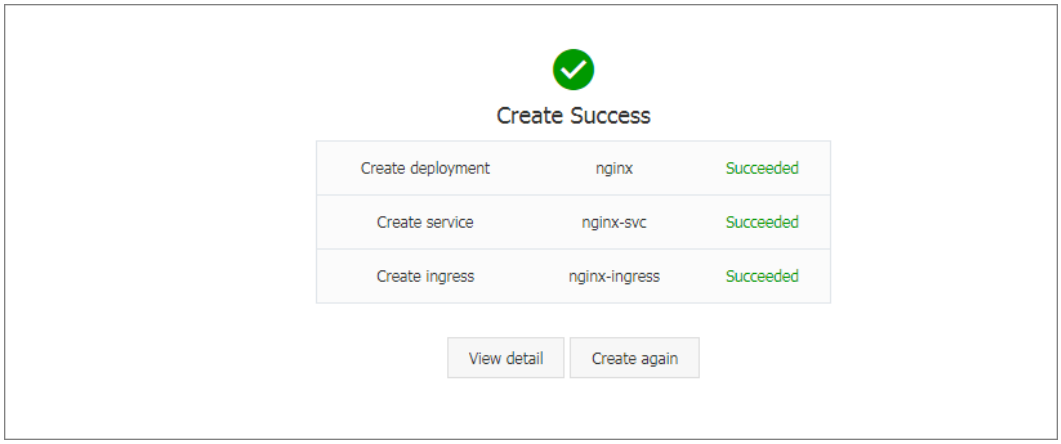
```
101.37.224.146   foo.bar.com    #The IP address of the Ingress.
```



iii. You can find the newly created Service and Ingress in the Access Control section. You can click **Update** or **Delete** to make changes.

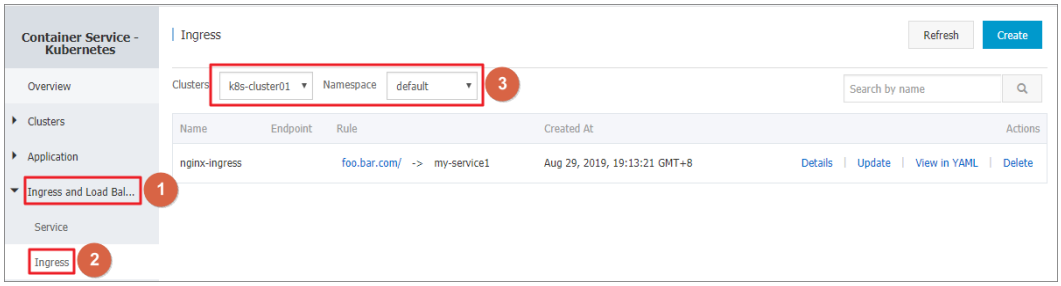


10. Click **Create**.
11. After the application is created, you are redirected to the Complete page, which displays the resource objects under the application. You can click **View Details** to view application details.



The nginx-deployment details page appears.

12. In the left-side navigation pane, choose **Services and Ingresses > Ingresses**. On the Ingresses page, you can find the created Ingress.



13. Enter the test domain in the address bar of your browser and press Enter. The NGINX welcome page appears.

3.1.6.7.2. Create an application from an orchestration template

Container Service provides orchestration templates that you can use to create applications. You can also modify the templates based on YAML syntax to customize applications.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Context

This topic describes how to use an orchestration template to create an NGINX application that consists of a Deployment and a Service. The Deployment provisions pods for the application and the Service manages access to the pods at the backend.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. Configure the template and click **Create**.
   - **Sample Template**: Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can also create a custom template based on YAML syntax to describe the resource that you want to define.
   - **Add Deployment**: This feature allows you to quickly define a YAML template.
   - **Use Existing Template**: You can import an existing template to the configuration page.

   The following NGINX template is based on an orchestration template provided by Container Service. You can use this template to quickly create a Deployment to run an NGINX application

   > **Note** Container Service supports YAML syntax. You can use the `---` symbol to separate multiple resource objects. This allows you to define multiple resource objects in a single template.

```
apiVersion: apps/v1beta2 # for versions before 1.8.0 use apps/v1beta1
kind: Deployment
metadata:
    name: nginx-deployment
    labels:
      app: nginx
spec:
    replicas: 2
    selector:
      matchLabels:
        app: nginx
    template:
      metadata:
        labels:
          app: nginx
      spec:
        containers:
        - name: nginx
          image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
          ports:
          - containerPort: 80
---
apiVersion: v1     # for versions before 1.8.0 use apps/v1beta1
kind: Service
metadata:
   name: my-service1        #TODO: to specify your service name
   labels:
     app: nginx
spec:
   selector:
     app: nginx             #TODO: change label selector to match your backend pod
   ports:
   - protocol: TCP
     name: http
     port: 30080            #TODO: choose an unique port on each node to avoid port conflict
     targetPort: 80
   type: LoadBalancer        ## In this example, the type is changed from NodePort to LoadBalancer
.
```

7. Click **Create**. A notification that indicates the deployment status appears.

   After the application is created, choose **Network > Services** in the left-side navigation pane. On the Services page, you can find that a Service named my-service1 is created for the application. The external endpoint of the Service is also displayed on the page. Click the endpoint in the **External Endpoint** column.

8. You can visit the NGINX welcome page in the browser.

3.1.6.7.3. Use commands to manage applications

You can use commands to create applications or view application containers.

Prerequisites

Before you use commands on your local host, you have connected to a Kubernetes cluster through kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.

Run a command to create an application

You can use the following command to run a simple container (an NGINX Web server in this example):

```
# kubectl run -it nginx --image=registry.aliyuncs.com/spacexnice/netdia:latest
```

This command creates a service portal for this container. After you specify `--type=LoadBalancer`, an SLB route to the NGINX container is created.

```
# kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
```

Run a command to view container information

Run the following command to list all running containers in the default namespace:

```
root@master # kubectl get pods
    NAME                                READY     STATUS    RESTARTS   AGE
    nginx-2721357637-dvwq3              1/1       Running   1          9h
```

3.1.6.7.4. Create a Service

You can create a Service for your application in the Container Service console to provide access to the application.

In Kubernetes, a Service is an abstraction that defines a logical set of pods and a policy by which to access the pods. This pattern is also known as a microservice. A label selector determines whether the set of pods can be accessed by the Service.

Each pod in Kubernetes clusters has its own IP address. However, pods are frequently created and deleted. Therefore, if you directly expose pods to external access, high availability is not ensured. Services decouple the frontend from the backend. The frontend clients do not need to be aware of which backend pods are used. This provides a loosely-coupled microservice architecture.

For more information, see Kubernetes Services.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Step 1: Create a Deployment

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select a namespace and click **Create from Template** in the upper-right corner.
6. Select a sample template or customize a template, and click **Create**.

   In this example, the template of an NGINX Deployment is used.

   ```
   apiVersion: apps/v1 # for versions before 1.8.0 use apps/v1beta1 kind: Deployment metadata: name: nginx-deployment-basic labels: app: nginx spec: replicas: 2 selector: matchLabels: app: nginx template: metadata: labels: app: nginx spec: # nodeSelector: # env: test-team containers: - name: nginx image: nginx:1.7.9 # replace it with your exactly <image_name:tags> ports: - containerPort: 80
   ```

Query the state of the Deployment.

Step 2: Create a Service

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Services**.
5. On the Services page, set **Namespace** and click **Create** in the upper-right corner.
6. In the Create Service dialog box, set the parameters.
   - **Name**: Enter a name for the Service. In this example, nginx-svc is used.
   - **Type**: Select the type of Service. This parameter specifies the Service is accessed. Valid values:
     - Cluster IP: a ClusterIP Service. This type of Service exposes pods through an internal IP address of the cluster. If you select this option, pods can be accessed from only within the cluster. This is the default value.
     - Node Port: a NodePort Service. This type of Service exposes pods by using the IP address and a static port of each node. A NodePort Service can be used to route requests to a ClusterIP Service, which is automatically created by the system. You can access a NodePort Service from outside the cluster by sending requests to `<NodeIP>:<NodePort>`.
     - Server Load Balancer: a LoadBalancer Service. This type of Service exposes pods by using Server Load Balancer (SLB) instances, which support Internet access or internal access. SLB instances can be used to route requests to NodePort and ClusterIP Services.
   - **Backend**: the backend object that you want to associate with the Service. In this example, select nginx-deployment-basic that was created in the preceding step. If you do not associate the Service with a backend object, no Endpoint object is created. You can also manually associate the Service with an Endpoint object. For more information, see Create a Service without selectors.
   - **Port Mapping**: Set the Service port and container port. The container port must be the same as the one that is exposed in the backend pod.
   - **Annotations**: Add one or more annotations to the Service to configure SLB parameters. For example, set the name to `service.beta.kubernetes.io` and the value to `20`. This means that the maximum bandwidth of the Service is 20 Mbit/s. For more information, see Access services by using SLB.
   - **Label**: Add one or more labels to the Service. The labels are used to identify the Service.
7. Click **Create**. After the nginx-svc Service is created, it appears on the Services page.

   On the **Services** page, you can view basic information about the Service. You can also access its external endpoint by using a browser.

3.1.6.7.5. View a Service

You can view details about a Service in the Container Service console.

Context

Each pod in Kubernetes clusters has its own IP address. However, pods are frequently created and deleted. Therefore, it is not practical to directly expose pods to external access. Services decouple the frontend from the backend, which provides a loosely-coupled microservice architecture.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

4. In the left-side navigation pane of the details page, choose **Network > Services**.
5. On the **Services** page, select the namespace, find the Service that you want to view, and then click **Details** in the Actions column.
   On the details page, you can view detailed information about the Service.

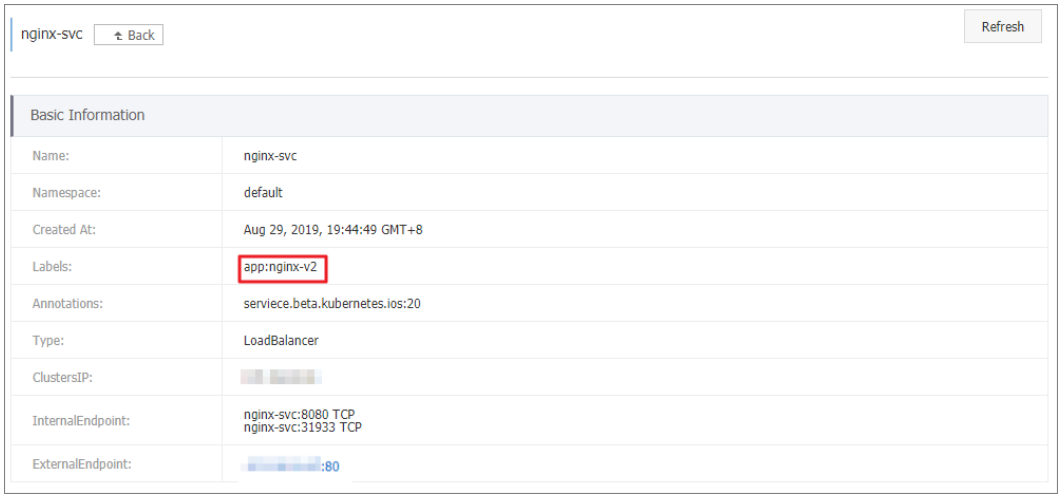
3.1.6.7.6. Update a Service

You can update a Service in the Container Service console. This topic describes how to update a Service.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Services**.
5. On the **Services** page, select the namespace, find the Service that you want to update, and then click **Update** in the Actions column.
6. In the **Update Service** dialog box, modify the configurations and click **Update**.

   In the Service list, find the Service that you updated and click **Details** in the Actions column to view configuration changes. In this example, the labels of the Service are modified.



3.1.6.7.7. Delete a Service

This topic describes how to delete a Service.

Prerequisites

- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- A Service is created. For more information, see Create Servcies.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Services**.
5. On the Services page, select the namespace, find the Service that you want to delete, and then click **Delete** in

the Actions column.

6. In the message that appears, click **Confirm**.

3.1.6.7.8. Use a trigger to redeploy an application

You can create a trigger and use it to redeploy an application. This topic describes how to use a trigger.

Prerequisites

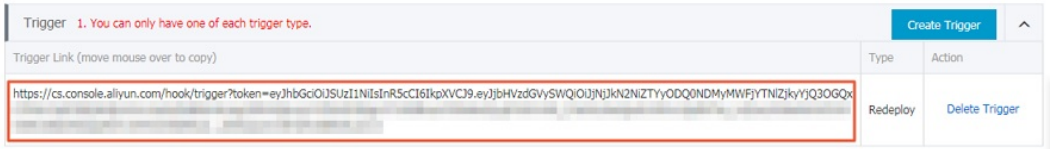
- A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.
- An application is created. Then, a trigger is created for the application and the application is used to test the trigger. In this example, an NGINX application is created.

Procedure

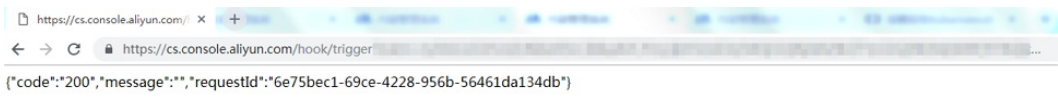
1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Manage** in the **Actions** column of the cluster.
4. In the left-side navigation pane, click Deployments. On the **Deployments** page, find the NGINX application and click **Details** in the Actions column.
5. On the details page of the application, click the **Triggers** tab. Then, click **Create Trigger**.
6. In the dialog box that appears, set Action to **Redeploy** and click **Confirm**.

   Note You can create triggers only to redeploy applications.

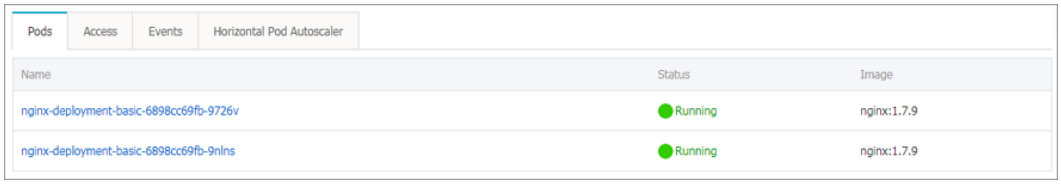
   After the trigger is created, the webhook URL of the trigger appears in the Trigger Link Address column on the **nginx - deployment** page.



7. Copy the webhook URL, enter it into the address bar of your browser, and press Enter. A message that indicates specific information such as the request ID appears.



8. Go to the **nginx - deployment** page. A new pod appears on the **Pods** tab.



After the new pod is deployed, the original pod is automatically deleted.

What's next

You can run triggers by sending GET or POST requests from an external system. For example, you can use the **curl** command-line tool to run triggers.

To run the redeploy trigger, run the following command:

```
curl https://cs.console.aliyun.com/hook/trigger?token=xxxxxxx
```

3.1.6.7.9. View pods

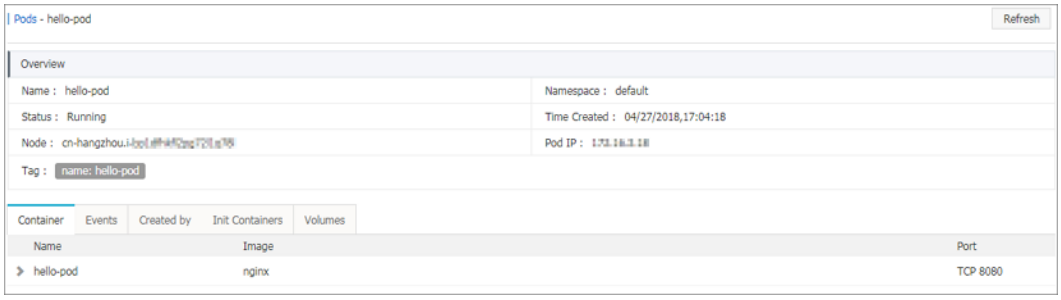
You can view pods in the Container Service console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. In the left-side navigation pane, choose **Applications > Pods**. The Pods page appears.
6. On the **Pods** page, select the namespace, find the pod that you want to view, and then click **View Details** in the Actions column.

> **Note** You can update or delete pods on the Pods page. We recommend that you use Deployments to manage pods if the pods are created by Deployments.

On the details page of the pod, you can view detailed information about the pod.



3.1.6.7.10. Manage pods

Pods are the smallest deployable units in Kubernetes. A pod runs an instance of an independent application in Kubernetes. Each pod contains one or more containers that are tightly coupled. You can modify pods, view pods, and manually scale the number of pods for an application in the Container Service console.

View pods

View pod details

1. Log on to the Container Service console.

2. In the left-side navigation pane of the Container Service console, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. Find the pod that you want to view and click **View Details** in the Actions column.

   You can view details of pods by using one of the following methods:

   - Method 1: In the left-side navigation pane of the details page, choose **Workloads > Deployments**. Find the application that you want to manage and click its name. On the **Pods** tab, click the name of the pod to view details.
   - Method 2: In the left-side navigation pane of the details page, choose **Network > Services**. Click the name of the Service that you want to manage. On the details page, find and click the name of the application that you want to manage. On the **Pods** tab, click the name of the pod to view details.

   > **Note** On the Pods page, you can modify and delete pods. For pods that are created by using a Deployment, we recommend that you use the Deployment to manage the pods.

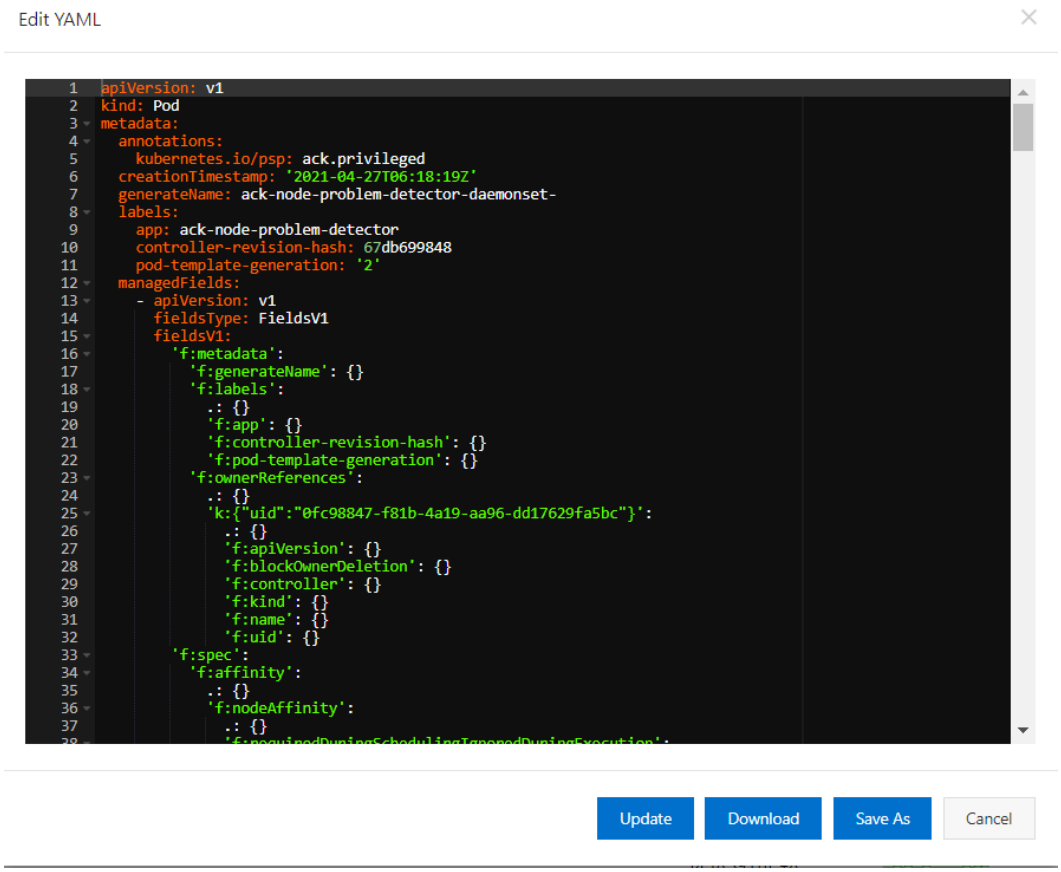
View pod log

You can view the log of a pod by using one of the following methods:

Navigate to the Pods tab, find the pod that you want to manage, and then click **Logs** on the right side of the page to view the log data.

Modify pod configurations

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
5. On the **Pods** page, find the pod that you want to manage and click **Edit** on the right side of the page.
6. In the Edit YAML dialog box, modify the configurations and click **Update**.



Manually scale the number of pods for an application

After an application is created, you can scale the number of pods that are provisioned for the application.

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. Select the namespace where the Deployment is deployed, find the Deployment, and then click **Scale** in the **Actions** column.
6. In the Scale dialog box, set Desired Number of Pods to 4 and click **OK**.

> **Note** By default, Deployments are updated based on the rollingUpdate strategy. This ensures that a minimum number of pods are available during the update. You can change this number in the YAML file.

3.1.6.7.11. Schedule pods to specific nodes

You can add labels to nodes and schedule pods to the nodes with specified labels. This topic describes how to schedule a pod to a node with specified labels.

You can add labels to nodes and then configure `nodeSelector` to schedule pods to nodes with specified labels. For more information about how nodeSelector works, see nodeselector.

To meet business requirements, you may want to deploy a controller service on a master node, or deploy services on nodes that use standard SSDs. You can use the following method to schedule pods to nodes with specified labels.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

Step 1: Add a label to a node

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, click **Manage Labels and Taints** in the upper-right corner.
6. Select one or more nodes and then click **Add Label**. In this example, a worker node is selected.
7. In the dialog box that appears, enter the name and value of the label and click **OK**.

   On the Labels tab, you can find the `group:worker` label next to the selected node.

You can also run the following command to add a label to a node: `kubectl label nodes <node-name> <label-key>=<label-value>` .

Step 2: Schedule a pod to the node

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. On the **Create** page, select a template from the Sample Template drop-down list. In this example, a custom template is selected. Copy the following content to the custom template and click **Create**.

   The following template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
  labels:
    name: hello-pod
  name: hello-pod
spec:
  containers:
    - image: nginx
      imagePullPolicy: IfNotPresent
      name: hello-pod
      ports:
        - containerPort: 8080
          protocol: TCP
      resources: {}
      securityContext:
        capabilities: {}
        privileged: false
      terminationMessagePath: /dev/termination-log
  dnsPolicy: ClusterFirst
  restartPolicy: Always
  nodeSelector:
    group: worker                          ## This value must be the same as the node label that
is added in Step 1.
 status: {}
```

3.1.6.7.12. Simplify application deployment by using Helm

This topic introduces the basic terms and components of Helm and describes how to use Helm to deploy an Apache Spark-based WordPress application in a Kubernetes cluster.

Prerequisites

- A Kubernetes cluster is created in the Container Service console. For more information, see Create a Kubernetes cluster.

  Tiller is automatically deployed to the cluster when the Kubernetes cluster is created. The Helm CLI is automatically installed on each master node. An Alibaba Cloud chart repository is added to Helm.

- A Kubernetes version that supports Helm is used.

  Only Kubernetes 1.8.4 and later support Helm. If the Kubernetes version of your cluster is 1.8.1, you can **upgrade** the cluster on the Clusters page of the Container Service console.

Context

Application management is the most challenging task in Kubernetes. The Helm project provides a unified method to package software and manage software versions. You can use Helm to simplify application distribution and deployment. App Catalog is integrated with Helm in the Container Service console and provides extended features based on Helm. App Catalog also supports Alibaba Cloud chart repositories to help you accelerate application deployments. You can deploy applications in the Container Service console or by using the Helm CLI.

This topic introduces the basic terms and components of Helm and describes how to use Helm to deploy an Apache Spark-based WordPress application in a Kubernetes cluster.

Basic terms

Helm is an open source project initiated by Deis. Helm can be used to simplify the deployment and management of Kubernetes applications.

Helm serves as a package manager for Kubernetes and allows you to find, share, and use applications built by Kubernetes. Before you use Helm, you must familiarize yourself with the following basic terms:

- Chart: a packaging format used by Helm. Each chart contains the images, dependencies, and resource definitions that are required to run an application. A chart may contain service definitions in a Kubernetes cluster. A Helm chart is similar to a Homebrew formula, an Advanced Package Tool (APT) dpkg, or a Yum rpm.
- Release: an instance of a chart that runs in a Kubernetes cluster. A chart can be installed multiple times in a Kubernetes cluster. After a chart is installed, a new release is created. For example, you can install a MySQL chart. If you want to run two databases in your cluster, you can install the MySQL chart twice. Each time a chart is installed, a release is created with a different name.
- Repository: the storage of charts. Charts are published and stored in repositories.

Helm components

Helm uses a client-server architecture and consists of the following components:

- The Helm CLI is the Helm client that runs on your on-premises machine or on the master nodes of a Kubernetes cluster.
- Tiller is the server-side component and runs in a Kubernetes cluster. Tiller manages the lifecycles of Kubernetes applications.
- A repository is used to store charts. The Helm client can access the index file and packaged charts in a chart repository over HTTP.

Deploy an application in the Container Service console

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > App Catalog**.
3. On the App Catalog page, find and click the WordPress chart to go to the details page of the chart.
4. Click the **Parameters** tab and modify the configurations.

   In this example, a dynamically provisioned disk volume is associated with a persistent volume claim (PVC). For more information, see Use Apsara Stack disks.

   > **Note** You must first provision a disk as a persistent volume (PV). The capacity of the PV cannot be less than the capacity specified in the PVC.

5. In the **Deploy** section, select the cluster in which you want to deploy the application and click **Create**. After the application is deployed, you are redirected to the release page of the application.
6. In the left-side navigation pane, click **Clusters**.
7. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
8. In the left-side navigation pane of the details page, choose **Network > Services**. On the Services page, select the namespace, find the Service that is created for the application, and then check its HTTP and HTTPS external endpoints.
9. Click one of the endpoints to go to the WordPress website where you can publish blog posts.

Deploy an application by using the Helm CLI

After the Helm CLI is automatically installed on the master nodes of the Kubernetes cluster and the required chart repository is added to Helm, you can log on to the master nodes by using SSH. Then, you can deploy applications by using the Helm CLI. For more information, see Connect to a master node through SSH. You can also install and configure the Helm CLI and kubectl on your on-premises machine.

In this example, the Helm CLI and kubectl are installed and configured on your on-premises machine, and then an Apache Spark-based WordPress application is deployed.

1. Install and configure the Helm CLI and kubectl.

i. Install and configure kubectl on your on-premises machine.

For more information, see Connect to a Kubernetes cluster through kubectl.

To view the details of a Kubernetes cluster, run the `kubectl cluster-info` command.

ii. Install Helm on your on-premises machine.

For more information, see Install Helm.

2. Deploy the WordPress application.

In the following example, a WordPress blog website is deployed by using Helm.

i. Run the following command:

```
helm install --name wordpress-test stable/wordpress
```

> **Note** Container Service allows you to mount disks as dynamically provisioned volumes. Before you deploy the application, you must create a disk volume.

The following output is returned:

```
NAME: wordpress-testLAST DEPLOYED: Mon Nov 20 19:01:55 2017NAMESPACE: defaultSTATUS: DEPLOYED.
..
```

ii. Run the following command to query the release and Service that are created for the WordPress application:

```
helm listkubectl get svc
```

iii. Run the following command to view the pods that are provisioned for the WordPress application. You may need to wait until the pods change to the Running state.

```
kubectl get pod
```

iv. Run the following command to obtain the endpoint of the WordPress application:

```
echo http://$(kubectl get svc wordpress-test-wordpress -o jsonpath='{.status.loadBalancer.ingress[0].ip}')
```

You can enter the preceding URL in the address bar of your browser to access the WordPress application.

You can also run the following command based on the chart description to obtain the username and password of the administrator account for the WordPress application:

```
echo Username: userecho Password: $(kubectl get secret --namespace default wordpress-test-wordpress -o jsonpath="{.data.wordpress-password}" | base64 --decode)
```

v. To delete the WordPress application, run the following command:

```
helm delete --purge wordpress-test
```

Use a third-party chart repository

You can use the default Alibaba Cloud chart repository. If a third-party chart repository is accessible from your cluster, you can also use the third-party chart repository. Run the following command to add a third-party chart repository to Helm:

```
helm repo add Repository name Repository URLhelm repo update
```

For more information about Helm commands, see Helm documentation.

References

Helm contributes to the development of Kubernetes. A growing number of software suppliers, such as Bitnami, have provided high-quality charts. For more information about available charts, visit `https://kubeapps.com/`.

3.1.6.8. SLB and Ingress

3.1.6.8.1. Overview

Container Service allows you to flexibly manage load balancing and customize load balancing policies for Kubernetes clusters. Kubernetes clusters provide you with a variety of methods to access containerized applications. They also allow you to use SLB or Ingress to access internal services and implement load balancing.

3.1.6.8.2. Use SLB to access Services

You can access a Service by using Server Load Balancer (SLB).

Procedure

1. Create an NGINX application by using a CLI.

```
root@master # kubectl run nginx --image=registry.aliyuncs.com/acs/netdia:latest
      root@master # kubectl get po
      NAME                                READY     STATUS    RESTARTS   AGE
      nginx-2721357637-dvwq3              1/1       Running   1          6s
```

2. Create a Service for the NGINX application and specify `type=LoadBalancer` to expose the Service to the Internet through an SLB instance.

```
root@master # kubectl expose deployment nginx --port=80 --target-port=80 --type=LoadBalancer
      root@master # kubectl get svc
      NAME                  CLUSTER-IP      EXTERNAL-IP      PORT(S)                       AGE
      nginx                 172.19.XX.XX    101.37.XX.XX     80:31891/TCP                  4s
```

3. Enter `http://101.37.XX.XX` in the address bar of your browser and press Enter to access the nginx Service.

SLB parameters

SLB provides a variety of parameters that you can use to configure features and services such as health check, billing method, and SLB instance type. For more information, see SLB annotations.

Annotations

You can add annotations to use the load balancing features provided by SLB.

Use an existing internal-facing SLB instance

Add two annotations. You must replace your-loadbalancer-id with the ID of your SLB instance.

```
apiVersion: v1
kind: Service
metadata:
  annotations:
    service.beta.kubernetes.io/alicloud-loadbalancer-address-type: intranet
    service.beta.kubernetes.io/alicloud-loadbalancer-id: your-loadbalancer-id
  labels:
    run: nginx
  name: nginx
  namespace: default
spec:
  ports:
  - name: web
    port: 80
    protocol: TCP
    targetPort: 80
  selector:
    run: nginx
  sessionAffinity: None
  type: LoadBalancer
```

Save the preceding code as an slb.svc file and run the `kubectl apply -f slb.svc` command.

Create an HTTPS-based LoadBalancer Service

You must first create a certificate in the SLB console. Then, you can use the certificate ID (cert-id) and the following template to create a LoadBalancer Service and an HTTPS-based SLB instance.

```
apiVersion: v1
kind: Service
metadata:
  annotations:
    service.beta.kubernetes.io/alicloud-loadbalancer-cert-id: your-cert-id
    service.beta.kubernetes.io/alicloud-loadbalancer-protocol-port: "https:443"
  labels:
    run: nginx
  name: nginx
  namespace: default
spec:
  ports:
  - name: web
    port: 443
    protocol: TCP
    targetPort: 443
  selector:
    run: nginx
  sessionAffinity: None
  type: LoadBalancer
```

Note Annotations are case-sensitive.

SLB annotations

Annotation	Description	Default
service.beta.kubernetes.io/alicloud-loadbalancer-protocol-port	The listening port. Separate multiple ports with commas (,). Example: https:443,http:80.	N/A

Annotation	Description	Default
service.beta.kubernetes.io/alicloud-loadbalancer-address-type	The type of the SLB instance. Valid values: internet and intranet.	internet
service.beta.kubernetes.io/alicloud-loadbalancer-slb-network-type	The network type of the SLB instance. Valid values: classic and vpc.	classic
service.beta.kubernetes.io/alicloud-loadbalancer-charge-type	The billing method of the SLB instance. Valid values: paybytraffic and paybybandwidth.	paybybandwidth
service.beta.kubernetes.io/alicloud-loadbalancer-id	The ID of an existing SLB instance. You can set the loadbalancer-id parameter to specify an existing SLB instance. In this case, the existing listeners are overwritten by the SLB instance. The SLB instance is not deleted when the Service is deleted.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-backend-label	The labels that are used to select the nodes to be added as the backend servers of the SLB instance.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-region	The region where the SLB instance is deployed.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-bandwidth	The bandwidth of the SLB instance.	50
service.beta.kubernetes.io/alicloud-loadbalancer-cert-id	The certificate ID. You must first upload the certificate.	""
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-flag	Valid values: on and off.	Default value: off. If TCP is used, do not modify this parameter. The health check feature is automatically enabled for TCP listeners and cannot be disabled.
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-type	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-uri	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-connect-port	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-healthy-threshold	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-unhealthy-threshold	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-interval	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A

Annotation	Description	Default
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-connect-timeout	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A
service.beta.kubernetes.io/alicloud-loadbalancer-health-check-timeout	For more information, see the *CreateLoadBalancerTCPListener* chapter of *SLB Developers Guide*.	N/A

3.1.6.8.3. Configure Ingress monitoring

You can enable the virtual host traffic status (VTS) dashboard to view Ingress monitoring data.

Enable the VTS dashboard by using the CLI

1. Add the following configuration item to the Ingress ConfigMap: `enable-vts-status: "true"` .

```
root@master # kubectl edit configmap nginx-configuration -n kube-system
      configmap "nginx-configuration" edited
```

The following template shows the modified Ingress ConfigMap:

```
apiVersion: v1
data:
  enable-vts-status: "true"# Enables the VTS dashboard.
  proxy-body-size: 20m
kind: ConfigMap
metadata:
  annotations:
    kubectl.kubernetes.io/last-applied-configuration: |
      {"apiVersion":"v1","data":{"proxy-body-size":"20m"},"kind":"ConfigMap","metadata":{"annotati
ons":{},"labels":{"app":"ingress-nginx"},"name":"nginx-configuration","namespace":"kube-system"}}
  creationTimestamp: 2018-03-20T07:10:18Z
  labels:
    app: ingress-nginx
  name: nginx-configuration
  namespace: kube-system
  selfLink: /api/v1/namespaces/kube-system/configmaps/nginx-configuration
```

2. Verify that the VTS dashboard is enabled for the NGINX Ingress controller.

```
root@master # kubectl get pods --selector=app=ingress-nginx -n kube-system
NAME                                       READY     STATUS    RESTARTS   AGE
nginx-ingress-controller-79877595c8-78gq8   1/1       Running   0          1h
root@master # kubectl exec -it nginx-ingress-controller-79877595c8-78gq8 -n kube-system -- cat /et
c/nginx/nginx.conf | grep vhost_traffic_status_display
        vhost_traffic_status_display;
        vhost_traffic_status_display_format html;
```

3. Access the VTS dashboard from an on-premises machine.

> **Note** By default, the VTS port is not exposed due to security concerns. In the following example, port forwarding is used to access the VTS dashboard.

```
root@master # kubectl port-forward nginx-ingress-controller-79877595c8-78gq8 -n kube-system 18080
Forwarding from 127.0.0.1:18080 -> 18080
Handling connection for 18080
```

4. Visit `http://localhost:18080/nginx_status` to access the VTS dashboard.

3.1.6.8.4. Ingresses

Kubernetes clusters support Ingress rules. You can define Ingress rules to meet your needs for load balancing.

In Kubernetes clusters, an Ingress is a set of routing rules that authorize external access to Services in clusters. You can use an Ingress to enable Layer 7 load balancing. You can configure an Ingress with URLs, Server Load Balancing (SLB) instances, SSL connections, and name-based virtual hosts to expose Services to external access.

Prerequisites

To test a complex routing scenario, an NGINX application is used in this example. A Deployment and multiple Services are created for the NGINX application. Replace Service names with the actual names.

```
kubectl run nginx --image=registry.cn-hangzhou.aliyuncs.com/acs/netdia:latest
kubectl expose deploy nginx --name=http-svc --port=80 --target-port=80
kubectl expose deploy nginx --name=http-svc1 --port=80 --target-port=80
kubectl expose deploy nginx --name=http-svc2 --port=80 --target-port80
kubectl expose deploy nginx --name=http-svc3 --port=80 --target-port=80
```

Create a simple Ingress

Run the following commands to create a simple Ingress that redirects traffic to the */svc* path to an http-svc Service. `nginx.ingress.kubernetes.io/rewrite-target: /` redirects traffic destined for the */svc* path to the */* path that can be recognized by the backend Service.

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple
  annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /
spec:
  rules:
  - http:
      paths:
      - path: /svc
        backend:
          serviceName: http-svc
          servicePort: 80
EOF
```

```
kubectl get ing
NAME            HOSTS         ADDRESS          PORTS     AGE
simple          *             101.37.19*.***   80        11s
```

You can visit `http://101.37.19*.***/svc` to access the Service of the NGINX application.

Create a simple fanout Ingress that uses multiple domain names

You can create a simple fanout Ingress to route traffic to multiple Services with different domain names. The following example shows the configuration of a simple fanout Ingress:

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple-fanout
spec:
  rules:
  - host: foo.bar.com
    http:
      paths:
      - path: /foo
        backend:
          serviceName: http-svc1
          servicePort: 80
      - path: /bar
        backend:
          serviceName: http-svc2
          servicePort: 80
  - host: foo.example.com
    http:
      paths:
      - path: /film
        backend:
          serviceName: http-svc3
          servicePort: 80
EOF
```

```
kubectl get ing
NAME            HOSTS         ADDRESS          PORTS     AGE
simple-fanout   *             101.37.19*.***   80        11s
```

After the preceding configuration is implemented, you can visit `http://foo.bar.com/foo` to access `http-svc1`, visit `http://foo.bar.com/bar` to access `http-svc2`, and visit `http://foo.example.com/film` to access `http-svc3`.

> **Note**
>
> - In a production environment, you must point the domain name to the returned address `101.37.192.211`.
> - In a test environment, you must add the following mapping rules to the `hosts` file.
>
> ```
> 101.37.19*.*** foo.bar.com
> 101.37.19*.*** foo.example.com
> ```

Create a simple Ingress that uses the default domain name

If you have no domain names, you can create a simple ingress that uses the default domain name provided by Container Service. Then, you can use the default domain name to access Services. The default domain name is in the following format: `*.[cluster-id].[region-id].alicontainer.com`. You can find the default domain name in the basic information of the Kubernetes cluster in the Container Service console.

The following example shows the configuration of a simple Ingress that allows external access to Services through the default domain name:

```
cat <<EOF | kubectl create -f -
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: shared-dns
spec:
  rules:
  - host: foo.[cluster-id].[region-id].alicontainer.com  ## Replace with the default domain name of yo
ur cluster.
    http:
      paths:
      - path: /
        backend:
          serviceName: http-svc1
          servicePort: 80
  - host: bar.[cluster-id].[region-id].alicontainer.com  ## Replace with the default domain name of yo
ur cluster.
    http:
      paths:
      - path: /
        backend:
          serviceName: http-svc2
          servicePort: 80
EOF
```

```
kubectl get ing
NAME            HOSTS         ADDRESS          PORTS     AGE
shared-dns    foo.[cluster-id].[region-id].alicontainer.com,bar.[cluster-id].[region-id].alicontainer.c
om             47.95.16*.***    80        40m
```

You can visit `http://foo.[cluster-id].[region-id].alicontainer.com/` to access Service `http-svc1` and visit `http://bar.[cluster-id].[region-id].alicontainer.com` to access Service `http-svc2`.

Create an Ingress to secure data transmission

Container Service allows you to use multiple types of certificates to reinforce the security of your applications.

1. Prepare a certificate.

   If you do not have a certificate, perform the following steps to generate a test certificate:

   > **Note** The domain name must be the same as the one specified in your Ingress configurations.

   ```
   openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN=foo.bar.com/O=foo.bar.com"
   ```

   After you run the preceding command, a certificate file *tls.crt* and a private key file *tls.key* are generated.

   Use the certificate and private key to create a Kubernetes Secret named *foo.bar*. The Secret is referenced when you create the Ingress.

   ```
   kubectl create secret tls foo.bar --key tls.key --cert tls.crt
   ```

2. Create an Ingress to secure data transmission.

   ```
   cat <<EOF | kubectl create -f -
   apiVersion: extensions/v1beta1
   kind: Ingress
   metadata:
     name: tls-fanout
   spec:
     tls:
     - hosts:
       - foo.bar.com
       secretName: foo.bar
     rules:
     - host: foo.bar.com
       http:
         paths:
         - path: /foo
           backend:
             serviceName: http-svc1
             servicePort: 80
         - path: /bar
           backend:
             serviceName: http-svc2
             servicePort: 80
   EOF
   ```

   ```
   kubectl get ing
   NAME            HOSTS         ADDRESS          PORTS     AGE
   tls-fanout      *             101.37.19*.***   80        11s
   ```

3. You must configure the `hosts` file or set a domain name to access the tls Ingress, as described in the **Create a simple fanout Ingress that uses multiple domain names** section.

   You can visit `http://foo.bar.com/foo` to access `http-svc1` and visit `http://foo.bar.com/bar` to access `http-svc2`.

   You can also access the HTTPS Service by using HTTP. By default, an HTTPS Ingress redirects HTTP traffic to HTTPS. Therefore, access to `http://foo.bar.com/foo` is redirected to `https://foo.bar.com/foo`.

Create an Ingress

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Ingresses**.
5. On the **Ingresses** page, select a namespace and click **Create Resources in YAML**.
6. On the **Create** page, select **Custom** from the **Sample Template** drop-down list, copy the following content into the template, and then click **Create**.

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple
spec:
  rules:
  - http:
      paths:
      - path: /svc
        backend:
          serviceName: http-svc
          servicePort: 80
```

An Ingress that routes Layer 7 traffic to the `http-svc` Service is created.

3.1.6.8.5. Ingress configurations

Container Service provides Ingress controller components. Integrated with Apsara Server Load Balancer, these components provide Kubernetes clusters with flexible and reliable Ingress service.

An Ingress orchestration template is provided below. When you configure an Ingress through the console, you need to configure annotations and may need to create dependencies. For more information, see Create an ingress through the console, Ingress support, and Kubernetes Ingress. You can also create ConfigMaps to configure Ingresses. For more information, see https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/configmap/.

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  annotations:
    nginx.ingress.kubernetes.io/service-match: 'new-nginx: header("foo", /^bar$/)' #Canary release rul
e. In this example, the request header is used.
    Nginx. ingress. kubernetes. IO/service-weight: 'New-nginx: 50, old-nginx: 50' #The route weight.
  creationTimestamp: null
  generation: 1
  name: nginx-ingress
  selfLink: /apis/extensions/v1beta1/namespaces/default/ingresses/nginx-ingress
spec:
  rules: ##The Ingress rule.
  - host: foo.bar.com
    http:
      paths:
      - backend:
          serviceName: new-nginx
          servicePort: 80
        path: /
      - backend:
          serviceName: old-nginx
          servicePort: 80
        path: /
tls:            ## Enable TLS for secure routing.
  - hosts:
    - *.xxxxxx.cn-hangzhou.alicontainer.com
    - foo.bar.com
    secretName: nginx-ingress-secret     ##The Secret name.
status:
  loadBalancer: {}
```

Annotations

For each Ingress, you can configure its annotations, Ingress controller, and rules, such as the route weight, canary release rule, and rewrite rules. For more information about annotations, see https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/.

For example, the following rewrite annotation, `nginx.ingress.kubernetes.io/rewrite-target: /`, indicates that */path* is redirected to the root path */*, which can be recognized by the backend service.

Rules

Ingress rules are used to manage external access to the services in the cluster and can be HTTP or HTTPS rules. You can configure the following items in rules: domain name (virtual hostname), URL path, service name, and port.

For each rule, you need to set the following parameters:

- Domain: The test domain or virtual hostname of your service, such as `foo.bar.com`.
- Path: The URL path of your service. Each path is associated with a backend service. Server Load Balancer only forwards traffic to the backend if the incoming request matches the domain and path.
- Service: Specify the service in the form of `service:port`. You also need to specify a route weight for each service. The Ingress routes traffic to the matching service based on the route weight.
  - Name: The name of the backend service.
  - Port: The port of the service.

- Weight: The route weight of the service in the service group.

  > **Note**
  >
  > a. The weight is a percentage value. For example, you can set two services to the same weight of 50%.
  >
  > b. A service group includes services that have the same domain and path defined in the Ingress configuration. If no weight is set for a service, the default value, 100, is used.

Canary release

Container Service supports multiple traffic splitting approaches to suit scenarios such as canary release and A/B testing.

> **Note** Currently, only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

1. Traffic splitting based on request header
2. Traffic splitting based on cookie
3. Traffic splitting based on query parameter

After canary release is configured, only requests that match certain rules are routed to the corresponding service. If the weight of the corresponding service is lower than 100%, requests that match certain rules are routed to one of the services in the service group based on the weight.

TLS

You can use a Secret that contains a TLS private key and certificate to encrypt the Ingress. This ensures secure routing. The TLS Secret must contain a certificate named tls.crt and a private key named tls.key. For more information about how TLS works, see TLS. For how to create a Secret, see Configure a secure Ingress.

Labels

You can add labels to the Ingress.

3.1.6.8.6. Create an Ingress in the console

The Container Service console is integrated with the Ingress service. You can create an Ingress in the console and manage inbound traffic that is forwarded to different Services to meet your business requirements.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller runs as normal in the cluster. For more information, see Create a Kubernetes cluster.
- You are connected to a master node by using kubectl. For more information, see Connect to a Kubernetes cluster through kubectl.
- Internet access is required when you pull the image from the address specified in this example. You can replace the address with an image address within your cluster. You can also build and push the image to an image repository and then pull the image from the repository when you use the image.

Step 1: Create a Deployment and a Service

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select a namespace and click **Create from Template** in the upper-right corner.

6. On the **Create** page, select a sample template or customize a template and click **Create**.

   In this example, two NGINX applications are created: old-nginx and new-nginx.

   The following template is used to create the old-nginx application:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: old-nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      run: old-nginx
  template:
    metadata:
      labels:
        run: old-nginx
    spec:
      containers:
      - image: registry.cn-hangzhou.aliyuncs.com/xianlu/old-nginx
        imagePullPolicy: Always
        name: old-nginx
        ports:
        - containerPort: 80
          protocol: TCP
      restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
  name: old-nginx
spec:
  ports:
  - port: 80
    protocol: TCP
    targetPort: 80
  selector:
    run: old-nginx
  sessionAffinity: None
  type: NodePort
```

   The following template is used to create the new-nginx application:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: new-nginx
spec:
  replicas: 1
  selector:
    matchLabels:
      run: new-nginx
  template:
    metadata:
      labels:
        run: new-nginx
    spec:
      containers:
      - image: registry.cn-hangzhou.aliyuncs.com/xianlu/new-nginx
        imagePullPolicy: Always
        name: new-nginx
        ports:
        - containerPort: 80
          protocol: TCP
      restartPolicy: Always
---
apiVersion: v1
kind: Service
metadata:
  name: new-nginx
spec:
  ports:
  - port: 80
    protocol: TCP
    targetPort: 80
  selector:
    run: new-nginx
  sessionAffinity: None
  type: NodePort
```

7. In the left-side navigation pane of the details page, choose **Network > Services**.

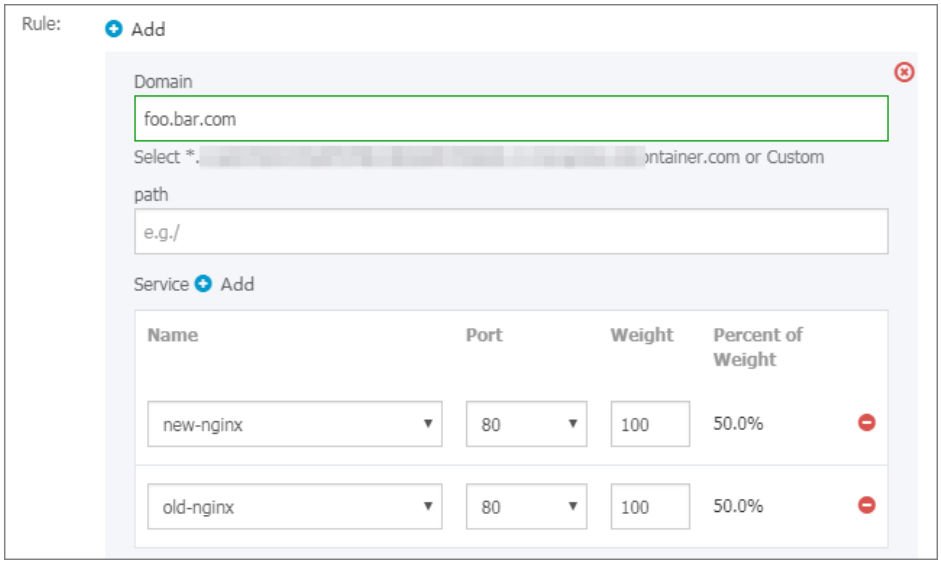
   After the Services are created, you can view the Services on the Services page.

Step 2: Create an Ingress

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. On the details page of the cluster, choose **Network > Ingresses** .
5. On the **Ingresses** page, select a namespace and click **Create** in the upper-right corner.
6. In the dialog box that appears, enter a name for the Ingress. In this example, the Ingress is named nginx-ingress.
7. Configure Ingress rules.

   Ingress rules are used to manage external access to Services in the cluster. Ingress rules can be HTTP or HTTPS rules. You can configure the following items in the rules: domain name (virtual hostname), URL path, Service name, port, and weight. For more information, see Ingress configurations.

   In this example, a complex rule is added to configure Services for the default domain name and virtual hostname of the cluster. Traffic routing is based on domain names.



Create a simple fanout Ingress that uses multiple domain names

In this example, a virtual hostname is used as the test domain name for external access. Route weights are specified for two backend Services and canary release settings are configured for one of the Services. In a production environment, you can use a domain name that has obtained an Internet Content Provider (ICP) number for external access.

- **Domain**: Enter the test domain name. In this example, the test domain name is `foo.bar.com`.

  You must add the following domain name mapping to the hosts file:

  ```
  118.178.XX.XX foo.bar.com       # The IP address of the Ingress.
  ```

- **Services**: Set the names, paths, port numbers, and weights of the backend Services.
  - Path: Enter the URL of the backend Service. In this example, the root path / is used.
  - Name: In this example, both the old-nginx and new-nginx Services are specified.
  - Port: In this example, port 80 is open.
  - Weight: Set a weight for each backend Service. The weight is a percentage value. The default value is 100. In this example, the weight of each backend Service is set to 50. This means that the two backend Services have the same weight.

8. Configure Transport Layer Security (TLS). Select **EnableTLS** to enable TLS and configure a secure Ingress. For more information, see Configure a secure Ingress.
   - You can use an existing Secret.

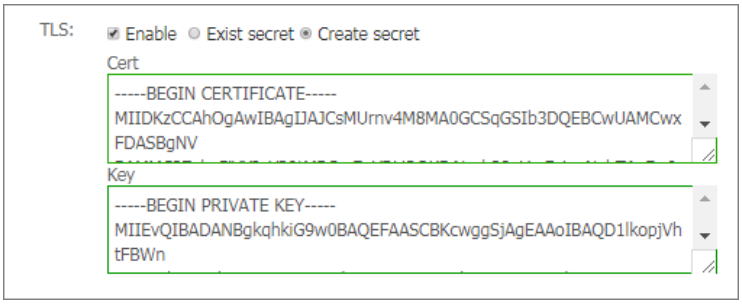
     
     a. Log on to a master node. Create a file named *tls.key* and another file named *tls.crt*.

     ```
     openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN
     =foo.bar.com/O=foo.bar.com"
     ```

     b. Create a Secret.

     ```
     kubectl create secret tls foo.bar --key tls.key --cert tls.crt
     ```

     c. Run the `kubectl get secret` command and verify that the Secret is created. Then, you can select the newly created Secret *foo.bar*.
   - You can also use the TLS private key and certificate to create a Secret.



a. Log on to a master node, and then create a file named *tls.key* and another file named *tls.crt*.

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj "/CN
=foo.bar.com/O=foo.bar.com"
```

b. Run the `vim tls.key` and `vim tls.crt` commands to obtain the private key and certificate that are generated.

c. Copy the certificate to the Cert field and the private key to the Key field.

9. Configure canary release settings.

> **Note** Only Ingress controllers of 0.12.0-5 and later versions support traffic splitting.

Container Service supports multiple traffic splitting methods. This allows you to select suitable solutions for specific scenarios, such as canary releases and A/B testing:

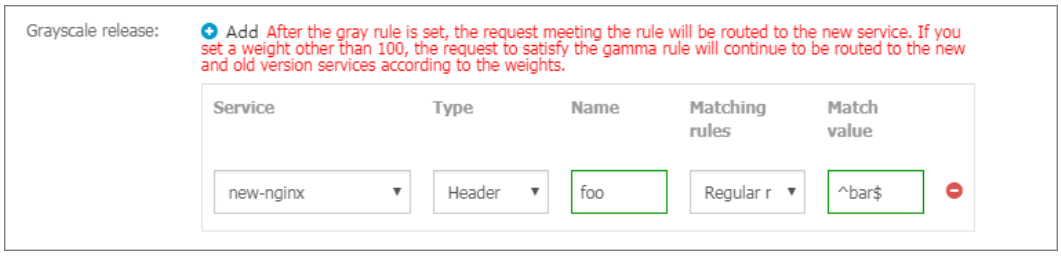
i. Traffic splitting based on request headers

ii. Traffic splitting based on cookies

iii. Traffic splitting based on query parameters

After canary release is configured, only requests that match the specified rules are routed to the new-nginx Service. If the weight of new-nginx is lower than 100%, requests that match the specified rules are routed to the Service based on the Service weight.

In this example, the rule is added to specify that only request headers with headers that match the regular expression `foo=^bar$` are forwarded to new-nginx.



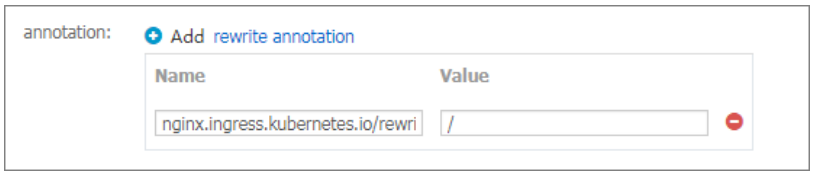
- **Services**: Specify the Services to be accessed.
- **Type**: Select the type of matching rule. Valid values: Header, Cookie, and Query.
- **Name and Match Value**: Specify the names and matching values of custom request fields in key-value pairs.
- **Matching Rule**: Regular expressions and exact matches are supported.

10. Configure annotations.

Click **Rewrite Annotation** and add an annotation to redirect inbound traffic for the Ingress. For example, `nginx.ingress.kubernetes.io/rewrite-target: /` specifies that */path* is redirected to the root path */* that can be recognized by the backend Services.

> **Note** In this example, no path is configured for the backend Services. Therefore, you do not need to configure rewrite annotations. Rewrite annotations allow the Ingress to forward traffic through the root path to the backend Services. This avoids the 404 error that is caused by invalid paths.

You can also click **Add** to enter annotation names and values in key-value pairs. For more information about Ingress annotations, visit https://kubernetes.github.io/ingress-nginx/user-guide/nginx-configuration/annotations/.

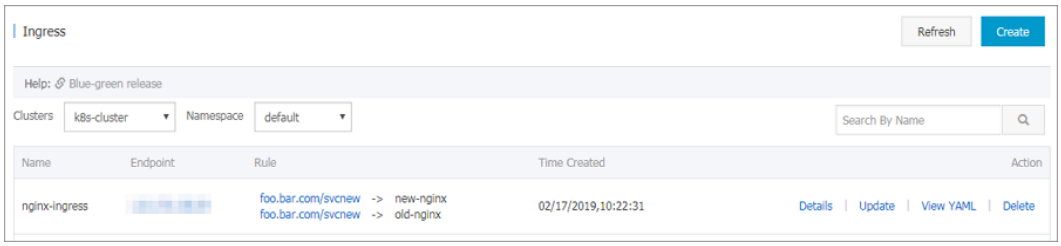


11. Add labels.

    Add labels to describe the characteristics of the Ingress.

12. Click **Create**. You are redirected to the Ingresses page.

    The newly created Ingress appears on the Ingresses page.



13. Click foo.bar.com to visit the NGINX welcome page.

    Click the domain name that points to new-nginx. The old-nginx application page appears.

> **Note** By default, when you enter the domain name in the browser, request headers do not match the regular expression `foo=^bar$`. Therefore, the requests are directed to old-nginx.

14. Log on to a master node by using SSH. Run the following commands to simulate requests with specific headers and check the results:

```
curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" http://47.107.XX.XX                    # Similar to a browser reques
t.
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX          # Simulate a request with
a specific header. The results are returned based on the weight.
new
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
old
 curl -H "Host: foo.bar.com" -H "foo: bar" http://47.107.XX.XX
new
```

3.1.6.8.7. Update an Ingress

You can update Ingresses in the Container Service console.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller is running as normal in the cluster. For more information, see Create a Kubernetes cluster.
- An Ingress is created. For more information, see Create an ingress through the console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Ingresses**.
5. On the **Ingresses** page, select the namespace, find the Ingress that you want to update, and then click **Update** in the Actions column.
6. In the dialog box that appears, modify the parameters and click **Update**. In this example, `foo.bar.com` is changed to `test.bar.com`.
   On the Ingresses page, you can verify that the Ingress rule has changed.

3.1.6.8.8. Delete an Ingress

This topic describes how to delete an Ingress.

Prerequisites

- A Kubernetes cluster is created and an Ingress controller is running as normal in the cluster. For more information about how to create a cluster, see Create a Kubernetes cluster.
- An Ingress is created. For more information, see Create an ingress through the console.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Network > Ingresses**.

5. On the **Ingresses** page, select the namespace, find the Ingress that you want to delete, and then click **Delete** in the Actions column.
6. In the message that appears, click **Confirm**.

3.1.6.9. Config maps and secrets

3.1.6.9.1. Create a ConfigMap

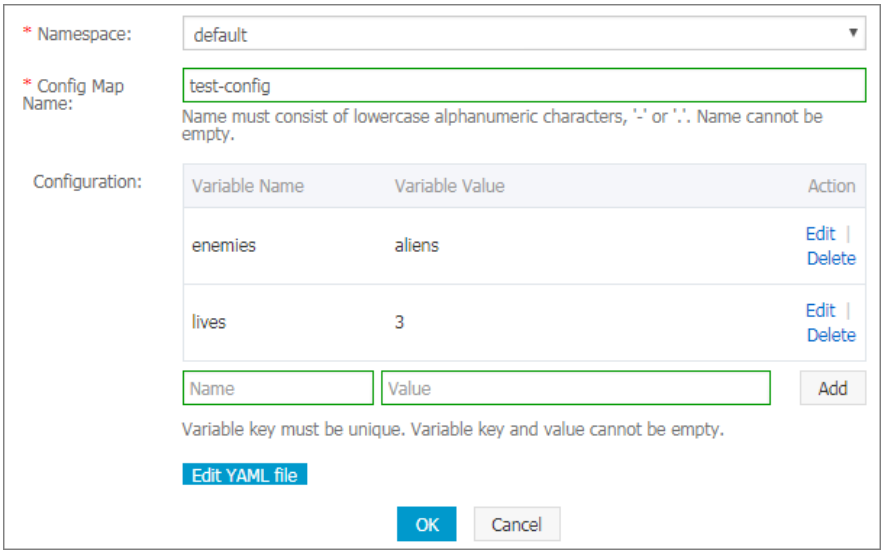
In the Container Service console, you can create a ConfigMap on the ConfigMap page or by using a template. This topic describes how to create a ConfigMap.

Create a ConfigMap on the ConfigMap page

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select a namespace and click **Create**.
6. Set the parameters and click **OK**. Create a ConfigMap on the ConfigMap page

Parameter	Description
Clusters	The ID of the cluster that you have selected.
Namespaces	The namespace that you have selected. A ConfigMap is a Kubernetes resource object and must be scoped to a namespace.
ConfigMap Name	The name of the ConfigMap. The name can contain lowercase letters, digits, hyphens (-), and periods (.). This parameter is required. Other resource objects must reference the ConfigMap name to obtain the configuration information.
ConfigMap	Specify **Name** and **Value**, and then click **Add** to add the key-value pair. You can also click **Edit YAML file**, modify the parameters in the dialog box that appears, and then click **OK**.

In this example, two variables named enemies and lives are created. Their values are set to aliens and 3 separately.



7. Click **OK**. You can find the test-config ConfigMap on the ConfigMap page.

You can also click **Browse** and upload a configuration file to create a ConfigMap.

Create a ConfigMap from a template

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
6. On the page that appears, set the parameters and click **Create**. Create a ConfigMap from a template

Parameter	Description
Sample Template	Container Service provides YAML templates of various resource types to help you quickly deploy resource objects. You can select *Custom* from the drop-down list and configure your ConfigMap based on YAML syntax. You can also select the *Resource-ConfigMap* template to create a ConfigMap. In the sample template, the ConfigMap is named aliyun-config and contains two variable files: *game.properties* and *ui.properties*. You can modify the ConfigMap based on your needs.
Template	Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by `---`.
Add Deployment	This feature allows you to quickly define a YAML template. You can click **Use Existing Template** to import an existing template.

After the deployment is completed, you can find the ConfigMap named *aliyun-config* on the ConfigMap page.

3.1.6.9.2. Use a ConfigMap in a pod

This topic describes how to use a ConfigMap in a pod.

You can use a ConfigMap in a pod in the following scenarios:

- Use a ConfigMap to define environment variables for a pod.
- Use a ConfigMap to set command line parameters.
- Use a ConfigMap in a volume.

For more information, see Configure a pod to use a ConfigMap.

Limits

To use a ConfigMap in a pod, make sure that the ConfigMap and the pod are in the same cluster and namespace.

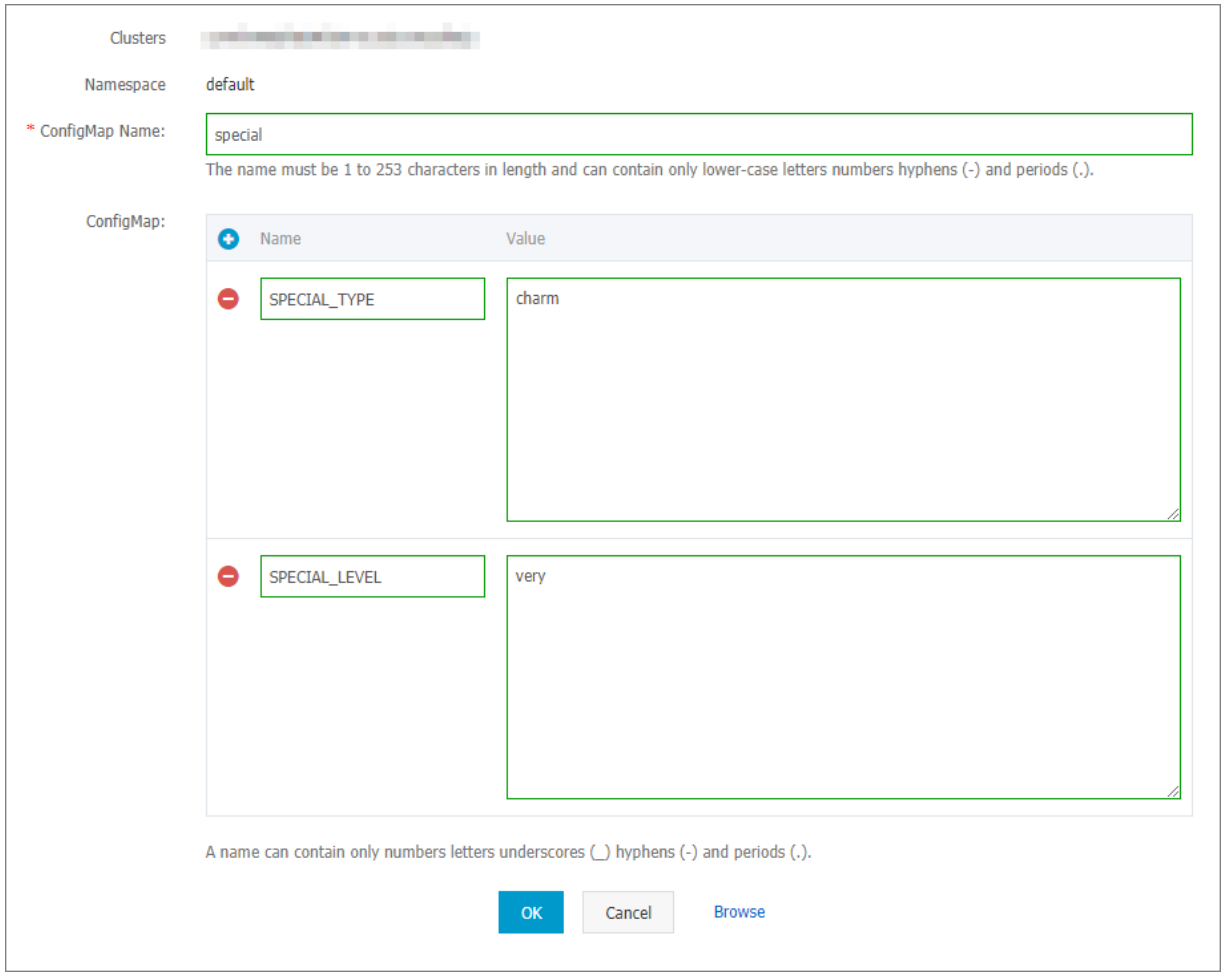
Create a ConfigMap

In this example, a ConfigMap named special_config is created. This ConfigMap consists of two key-value pairs: `SPECIAL_LEVEL: very` and `SPECIAL_TYPE: charm`.

You can use the following YAML template to create the ConfigMap:

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: special-config
  namespace: default
data:
  SPECIAL_LEVEL: very
  SPECIAL_TYPE: charm
```

You can also log on to the Container Service console and choose **Configuration > ConfigMaps** in the left-side navigation pane. You can then click **Create** to create the ConfigMap.



Use a ConfigMap to define one or multiple environment variables for a pod

Use a key-value pair of a ConfigMap to define one environment variable

You can log on to the Container Service console. In the left-side navigation pane, click **Clusters**. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column. In the left-side navigation pane of the details page, choose **Workloads > Deployments**. Click **Create from Template**, select a pod template from the Sample Template drop-down list, and then start the deployment.

You can use the following sample template to create a pod and defines environment variables in the pod. valueFrom is used to reference the value of SPECIAL_LEVEL to define an environment variable.

```
apiVersion: v1
kind: Pod
metadata:
  name: config-pod-1
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "env" ]
      env:
        - name: SPECIAL_LEVEL_KEY
          valueFrom:                              ##valueFrom is used to reference the value of the Con
figMap to define an environment variable.
            configMapKeyRef:
              name: special-config                ##The name of the referenced ConfigMap.
              key: SPECIAL_LEVEL                  ##The key of the referenced key-value pair.
  restartPolicy: Never
```

To use the values of multiple ConfigMaps to define multiple environment variables, add multiple env parameters to the pod configuration file.

Use all the key-value pairs of a ConfigMap to define multiple environment variables

To define the key-value pairs of a ConfigMap as pod environment variables, you can use the envFrom parameter. The keys in a ConfigMap are used as the names of the environment variables.

The following sample template is used to create a pod:

```
apiVersion: v1
kind: Pod
metadata:
  name: config-pod-2
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "env" ]
      envFrom:                ##Reference all the key-value pairs of the sepcial-config ConfigMap.
      - configMapRef:
        name: special-config
  restartPolicy: Never
```

Use a ConfigMap to set command line parameters

You can use ConfigMaps to define the commands or parameter values for a container by using the environment variable replacement syntax *$(VAR_NAME)*. The following template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
  name: config-pod-3
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "echo $(SPECIAL_LEVEL_KEY) $(SPECIAL_TYPE_KEY)" ]
      env:
        - name: SPECIAL_LEVEL_KEY
          valueFrom:
            configMapKeyRef:
              name: special-config
              key: SPECIAL_LEVEL
        - name: SPECIAL_TYPE_KEY
          valueFrom:
            configMapKeyRef:
              name: special-config
              key: SPECIAL_TYPE
  restartPolicy: Never
```

After you run the pod, the following output is returned:

```
very charm
```

Use a ConfigMap in a volume

You can use a ConfigMap to define volumes. The following sample template specifies a ConfigMap name under volumes. This stores the key-value pairs of the ConfigMap to the path that you specified in the mountPath field. In this example, the path is /etc/config. This generates configuration files that are named after the keys of the ConfigMap. The corresponding values of the ConfigMap are stored in these files.

```
apiVersion: v1
kind: Pod
metadata:
  name: config-pod-4
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "ls /etc/config/" ]   ##List the files under the directory.
      volumeMounts:
        - name: config-volume
          mountPath: /etc/config
   volumes:
     - name: config-volume
       configMap:
         name: special-config
  restartPolicy: Never
```

After you run the pod, the following output is returned:

```
SPECIAL_TYPE
SPECIAL_LEVEL
```

3.1.6.9.3. Update a ConfigMap

You can use multiple methods to update a ConfigMap.

Considerations

If you update a ConfigMap, the applications that use the ConfigMap are affected.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select the namespace, find the ConfigMap that you want to update, and then click **Edit** in the Actions column.
6. In the dialog box that appears, modify the configurations and click **OK**.

3.1.6.9.4. Delete a ConfigMap

You can use multiple methods to delete a ConfigMap.

Considerations

If you delete a ConfigMap, the applications that use this ConfigMap are affected.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > ConfigMaps**.
5. On the **ConfigMap** page, select the namespace, find the ConfigMap that you want to delete, and then click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

3.1.6.9.5. Create a Secret

You can create Secrets for applications in the Container Service console.

Prerequisites

A Kubernetes cluster is created.

Context

We recommend that you use Secrets to store sensitive information in Kubernetes clusters, such as passwords and certificates.

Secrets are classified into the following types:

- Service account: A service account is automatically created by Kubernetes and automatically mounted to the */run/secrets/kubernetes.io/serviceaccount* directory of a pod. The service account provides an identity for the pod to interact with the API server.
- Opaque: This type of secret is encoded in Base64 and used to store sensitive information, such as passwords and certificates.

By default, you can create only Opaque Secrets in the Container Service console. Opaque Secrets store map type data. Therefore, values must be encoded in Base64. You can create Secrets in the Container Service console with a few clicks. Plaintext is automatically encoded in Base64.

You can also create Secrets by using the CLI. For more information, see Kubernetes Secrets.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the **Secrets** page, select the namespace and click **Create** in the upper-right corner.
6. Configure the Secret and click **OK**.

   Note To enter Secret data in plaintext, select **Encode Data Values Using Base64**.

Parameter	Description
Name	Enter a name for the Secret. The name must be 1 to 253 characters in length, and can contain only lowercase letters, digits, hyphens (-), and periods (.).
Namespace	Select the namespace of the Secret.
Type	You can select Opaque, Private Repository Logon Secret, or TLS Certificate.
Opaque	If you set Type to Opaque, configure the following parameters: ○ (Optional)To enter Secret data in plaintext, select **Encode Data Values Using Base64**. ○ Configure the Secret in key-value pairs. Click **+ Add**. Enter the keys and values for the Secret in the **Name** and **Value** fields.
Private Repository Logon Secret	If you set Type to Private Repository Logon Secret, configure the following parameters: ○ Docker Registry URL: Enter the address of the Docker registry where your Secret is stored. ○ Username: Enter the username that is used to log on to the Docker registry. ○ Password: Enter the password that is used to log on to the Docker registry.
TLS Certificate	If you set Type to TLS Certificate, configure the following parameters: ○ Cert: Enter a TLS certificate. ○ Key: Enter the key for the TLS certificate.

You can view the newly created Secret on the Secrets page.

3.1.6.9.6. Modify a Secret

This topic describes how to modify a Secret in the Container Service console.

Prerequisites

- A Kubernetes cluster is created.
- A Secret is created. For more information, see Create a secret.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the Secrets page, select the namespace, find the Secret that you want to modify, and then click **Edit** in the Actions column.
6. In the dialog box that appears, modify the Secret and click **OK**.

3.1.6.9.7. Delete a Secret

This topic describes how to delete a Secret in the Container Service console.

Prerequisites

- A Kubernetes cluster is created.
- A Secret is created. For more information, see Create a secret.

Context

> **Note** Do not delete Secrets that are generated when the cluster is created.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Configurations > Secrets**.
5. On the **Secrets** page, select the namespace, find the Secret that you want to delete, and then click **Delete** in the **Actions** column.
6. In the message that appears, click **OK**.

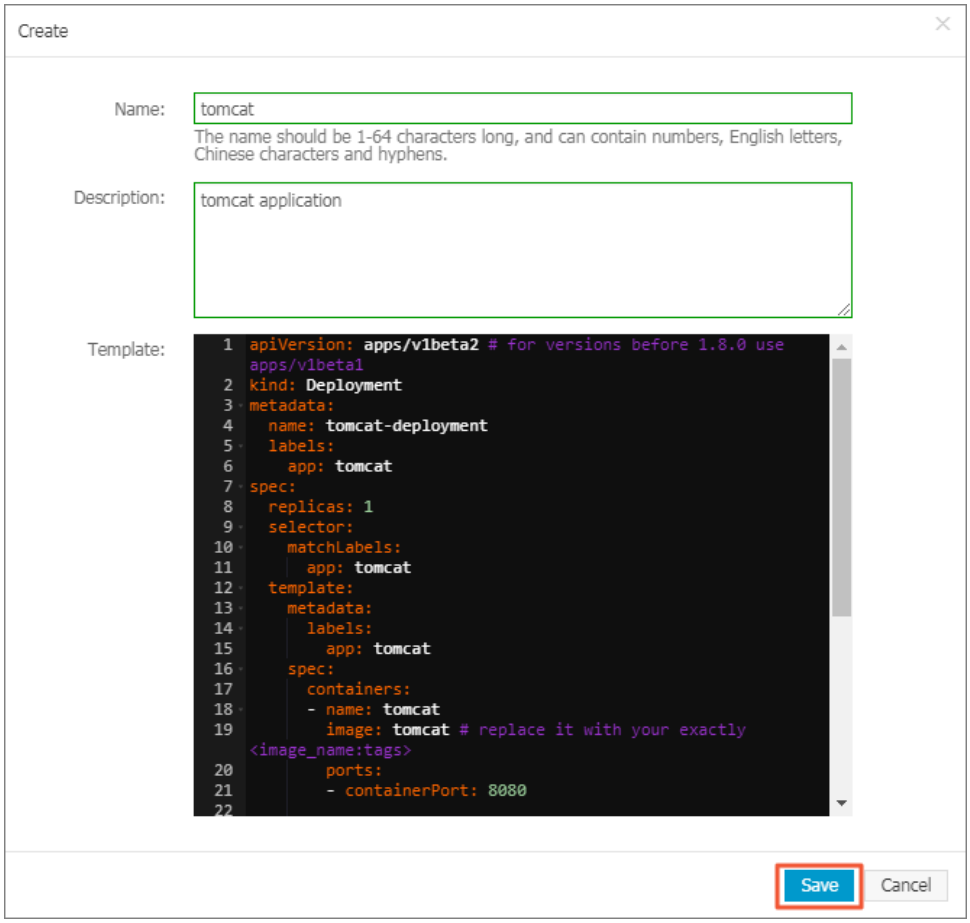
3.1.6.10. Templates

3.1.6.10.1. Create an orchestration template

This topic describes how to use multiple methods to create orchestration templates through the Container Service console.

Procedure

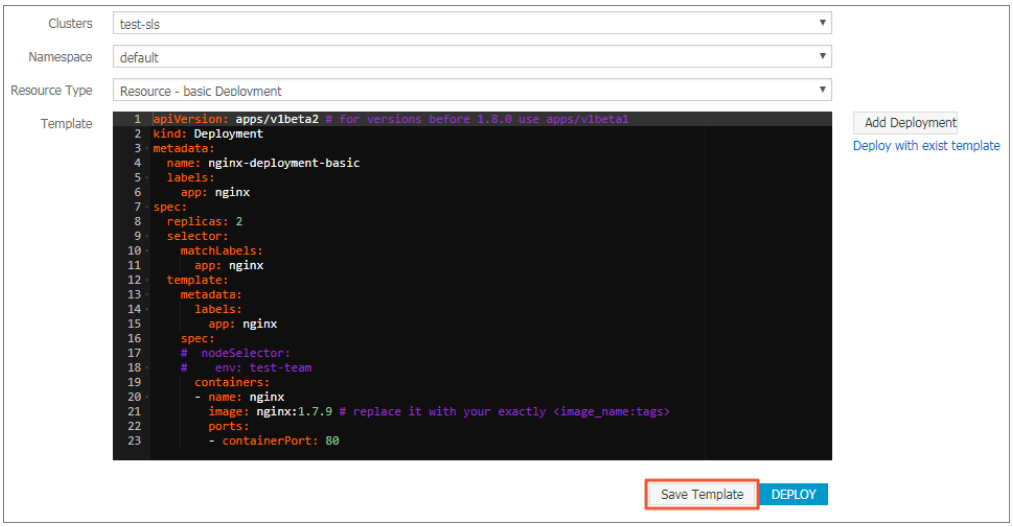
1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates** and click **Create** in the upper-right corner.
3. In the dialog box that appears, configure the template, and then click **Save**. This example demonstrates how to create a Tomcat application template that contains a deployment and a service.
   - **Name**: The name of the template.
   - **Description**: Optional. The description of the template.
   - **Template**: Enter the template content based on YAML syntax. The template can contain multiple resource objects that are separated by `---`.



4. After the template is created, you are redirected to the **Templates** page by default. You can find the template on the **My Templates** tab.

5. (Optional)You can also choose **Applications > Deployments** in the left-side navigation pane, and click **Create from Template** to go to the **Create from Template** page. You can modify a built-in template provided by Container Service and save it as a custom template.

i. Select a built-in template and click **Save Template**.



ii. In the dialog box that appears, specify the name, description, and content. Click **Save** to save the template.

> **Note** You can modify the built-in template based on your needs.

iii. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. You can find the newly created template on the **My Templates** tab.

What's next

You can use the orchestration templates on the **My Templates** tab to quickly create applications.

3.1.6.10.2. Update an orchestration template

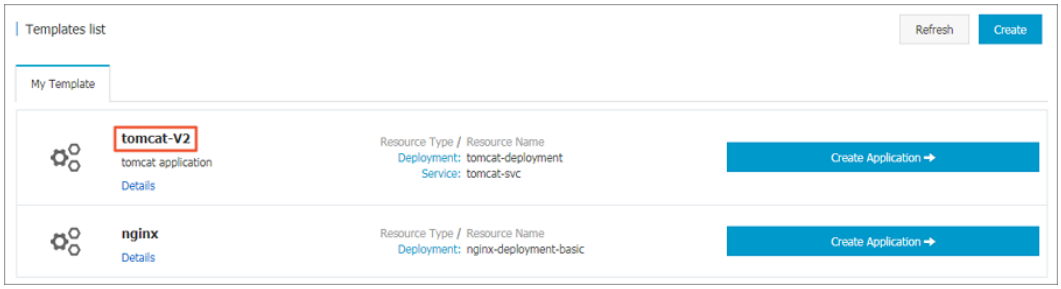
This topic describes how to edit and update an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Edit** in the upper-right corner.
5. In the dialog box that appears, edit the name, description, and template content, and click **Save**.
6. Go to the **Templates** page. You can view the template that you have updated on the **My Templates** tab.



3.1.6.10.3. Save an orchestration template as a new one

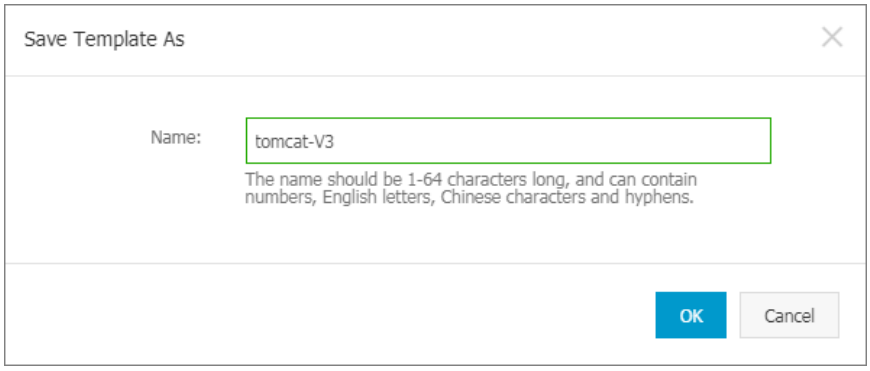
This topic describes how to save an orchestration template as a new one.

Prerequisites

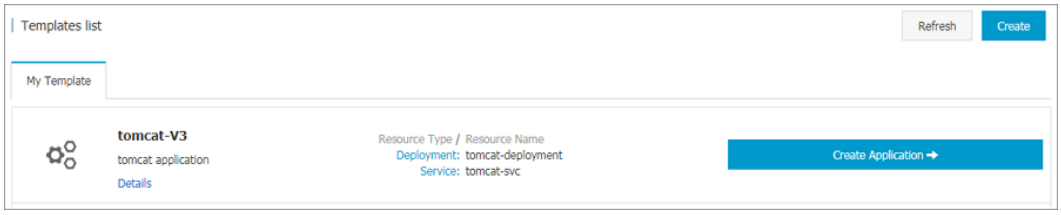
You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, modify the template and click **Save As** in the upper-right corner.
5. In the dialog box that appears, enter the template name and click **OK**.



6. Go to the **Templates** page. The newly saved template is displayed on the **My Templates** tab.



3.1.6.10.4. Download an orchestration template

This topic describes how to download an orchestration template.

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Download** in the upper-right corner to download the template as a YAML file.

3.1.6.10.5. Delete an orchestration template

Prerequisites

You have created an orchestration template. For more information, see Create orchestration templates.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > Orchestration Templates**. The **Templates** page appears. You can view existing templates on the **My Templates** tab.
3. Select the target template and click **Details**.
4. On the template details page, click **Delete** in the upper-right corner.
5. In the dialog box that appears, click **OK**.

3.1.6.11. Log management

3.1.6.11.1. Use Log Service to collect log data from containers

Container Service is integrated with Log Service. When you create a cluster, you can enable Log Service to collect log data from containers, including standard output (stdout) and text files.

Activate Log Service

To activate Log Service, perform the following steps:

1. Log on to the Apsara Uni-manager Management Console. In the top navigation bar, choose **Products > Log Service** to go to the **Log Service** page.
2. Select the required organization and region.
3. Click **SLS** to go to the Log Service console.

Create a Kubernetes cluster that has Log Service enabled

To create a Kubernetes cluster, perform the following steps:

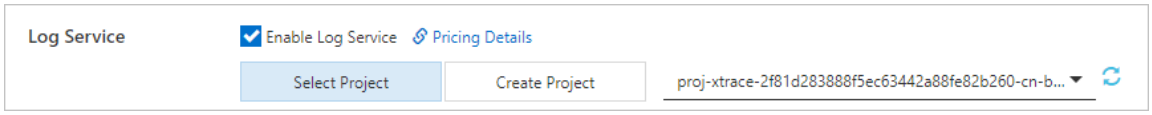
1. Log on to the Container Service console.

   > **Note** The specified organization must be the same as the one that you selected when you activated Log Service. For more information, see Activate Log Service.

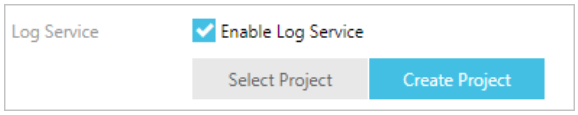
2. In the left-side navigation pane, click **Clusters**.
3. On the Clusters page, click **Create Kubernetes Cluster**. For more information, see Create a Kubernetes cluster.
4. In the lower part of the page, select **Enable Log Service** to install the Log Service component.

When the **Enable Log Service** check box is selected, the system prompts you to create a Log Service project. Select one of the following methods to specify a project in one of the following ways:

- You can select an existing project to manage the collected logs.



- You can click Create Project. Then, a project named `k8s-log-{ClusterID}` is automatically created to manage the collected logs. ClusterID indicates the unique ID of the cluster to be created.



5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.
   On the Clusters page, you can find the created cluster.

Install the Log Service component in an existing Kubernetes cluster

If you created a Kubernetes cluster and activated Log Service, you can perform the following steps to enable Log Service:

1. Connect to the Kubernetes cluster by using CloudShell.

   For more information, see Connect to a Kubernetes cluster through kubectl.
2. Run the *logtail-dedicated.sh* script to install the Log Service component in the Kubernetes cluster.

```
#!/env/bin/bash
yaml=$(cat <<-END

          type: Directory
      - name: alibaba-log-config-file-volume
        configMap:
          name: alibaba-log-config-file
END
)
echo "$yaml" > logtail.yml
kubectl create -f logtail.yml
```

3. Replace `<your_server_architecture>`, `<your_k8s_cluster_region_id>`, `<your_k8s_cluster_id>`, `<k8s_cluster_domain_suffix>`, `<your_ali_uid>`, and `<your_image_repo_url>` with actual values, and run the following commands. This allows you to set the environment variables and deploy the component.

```
export ARCH=<your_server_architecture>
export REGION=<your_k8s_cluster_region_id>
export CLUSTER_ID=<your_k8s_cluster_id>
export INTERNET_DOMAIN=<k8s_cluster_domain_suffix>
export IMAGE_REPO_URL=<your_image_repo_url>
export ALI_UID=<your_ali_uid>
bash logtail-dedicated.sh // Run the script to install the component.
```

> **Note**
>
> - `<your_server_architecture>`: the server architecture, for example, amd64.
> - `<your_k8s_cluster_region_id>`: the region where the Kubernetes cluster is deployed, for example, cn-qingdao-apsara-d01.
> - `<your_k8s_cluster_id>`: the ID of the Kubernetes cluster.
> - `<k8s_cluster_domain_suffix>`: the domain suffix of the Kubernetes cluster, for example, env28.internet.com.
> - `<your_ali_uid>`: the ID of the Apsara Stack tenant account, for example, 1234074238634394.
> - `<your_image_repo_url>`: the URL of the image repository, for example, registry.cn-hangzhou.aliyuncs.com.

Create an application and configure Log Service

When you create an application in Container Service, you can configure Log Service to collect logs from containers. You can use only YAML templates to configure Log Service.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the cluster details page, choose **Workloads > Deployments**. On the Deployments page, click **Create from Template** in the upper-right corner.
5. Set **Sample Template** to **Custom** and configure the template.

   YAML templates follow the Kubernetes syntax. You can use environment variables to add **collection configurations** and **custom tags**. You must also configure volumeMounts and volumes. The following template is used to create a pod for collecting log data:

```
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  labels:
    app: logtail-test
  name: logtail-test
spec:
  replicas: 1
  template:
    metadata:
      labels:
        app: logtail-test
      name: logtail-test
    spec:
      containers:
      - name: logtail
        image: registry.acs.env28.intranet.com/acs/busybox:latest
        args:
        - ping
        - 127.0.0.1
        env:
        - name: aliyun_logs_log-stdout
          value: stdout
        - name: aliyun_logs_log-varlog
          value: /log/*.log
        - name: aliyun_logs_log_tags
          value: tag1=v1
        volumeMounts:
        - name: volumn-sls
          mountPath: /log
      volumes:
      - name: volumn-sls
        emptyDir: {}
```

- Specify the following configurations in order based on your business requirements:
- Use environment variables to add **collection configurations** and **custom tags**. All environment variables for collection configurations must use the `aliyun_logs_` prefix.
- Add log collection configurations in the following format:

  ```
  - name: aliyun_logs_{Logstore name}
    value: {Log path}
  ```

  In the preceding YAML template, two environment variables are added to the log collection configuration. The environment variable `aliyun_logs_log-stdout` specifies that a Logstore named log-stdout is created to store the stdout collected from containers.

  > **Note** The name of the Logstore cannot contain underscores (_). You can use hyphens (-) instead.

- **Custom tags** must be specified in the following format:

  ```
  - name: aliyun_logs_{Tag name without underscores (_)}_tags
    value: {Tag name }={Tag value}
  ```

  After a tag is added, the tag is automatically appended to the log content that are collected from the container.
- If you specify a log path to collect log files that are not stdout, you must configure volumeMounts.

In the preceding YAML template, the mountPath field in volumeMounts is set to */var/log*. This allows logtail-ds to collect log data from the */var/log/*.log* file.

6. After you modify the YAML template, click **Create** to submit the configurations.

Environment variables

You can specify various environment variables to configure log collection. The following table describes the variables.

Variable	Description	Example	Remarks

aliyun_logs_{key}	• Required.{key} can contain only lowercase letters, digits, and hyphens (-), and cannot contain underscores (_).
	• If the specified aliyun_logs_{key}_logstore does not exist, a Logstore named {key} is created.
	• To collect the stdout of containers, set the value to stdout. You can also set the value to a path inside a container to collect the log files.
		`- name: aliyun_logs_catalina`
		`stdout`
		
		`- name: aliyun_logs_access-log`
		
		`/var/log/nginx/access.log`
			• By default, the Log Service component collects log files in simple mode. In this case, the collected log data not parsed. If you want to parse the log data, we recommend that you change the collection mode in the Log Service console.
			• The value of {key} must be unique in the cluster.

aliyun_logs_{key}_tags	Optional. This variable is used to add tags to log data. The value must be in the following format: {tag-key}={tag-value}.	`- name: aliyun_logs_catalina_tags` `app=catalina`	-
aliyun_logs_{key}_project	Optional. This variable specifies a project in Log Service. By default, the project that you specified when you created the cluster is used.	`- name: aliyun_logs_catalina_project` `my-k8s-project`	The region of the project must be the same as where logtail-ds is deployed.
aliyun_logs_{key}_logstore	Optional. This variable specifies a Logstore in Log Service. By default, the Logstore is named after {key}.	`- name: aliyun_logs_catalina_tags` `my-logstore`	-

Variable	Description	Example	Remarks
aliyun_logs_{key}_shard	Optional. This variable specifies the number of shards in the Logstore. Valid values: 1 to 10. Default value: 2.	- name: aliyun_logs_catalina_shard 4	-
aliyun_logs_{key}_ttl	Optional. This variable specifies the number of days for which log data is retained. Valid values: 1 to 3650. • To permanently retain log data, set the value to 3650. • Default value: 90.	- name: aliyun_logs_catalina_ttl 3650	-
aliyun_logs_{key}_machinegroup	Optional. This variable specifies the machine group of the application. By default, the machine group is the one where logtail-ds is deployed.	- name: aliyun_logs_catalina_machinegroup my-machine-group	-

- Scenario 1: Collect logs from multiple applications and store them in the same Logstore

  In this scenario, set the aliyun_logs_{key}_logstore variable. The following example shows how to collect stdout from two applications and store the outputs in stdout-logstore.

  Configure the following environment variables for Application 1:

```
######### Configure environment variables ############
    - name: aliyun_logs_app1-stdout
      value: stdout
    - name: aliyun_logs_app1-stdout_logstore
      value: stdout-logstore
```

  Configure the following environment variables for Application 2:

```
######### Configure environment variables ############
    - name: aliyun_logs_app2-stdout
      value: stdout
    - name: aliyun_logs_app2-stdout_logstore
      value: stdout-logstore
```

- Scenario 2: Collect logs from different applications and store them in different projects

  In this scenario, perform the following steps:

  i. Create a machine group in each project and set the machine group ID in the following format: k8s-group-{cluster-id}, where {cluster-id} is the ID of the cluster. You can customize the machine group name.

  ii. Specify the project, Logstore, and the created machine group in the environment variables for each application.

```
######### Configure environment variables ###########
    - name: aliyun_logs_app1-stdout
      value: stdout
    - name: aliyun_logs_app1-stdout_project
      value: app1-project
    - name: aliyun_logs_app1-stdout_logstore
      value: app1-logstore
    - name: aliyun_logs_app1-stdout_machinegroup
      value: app1-machine-group
```

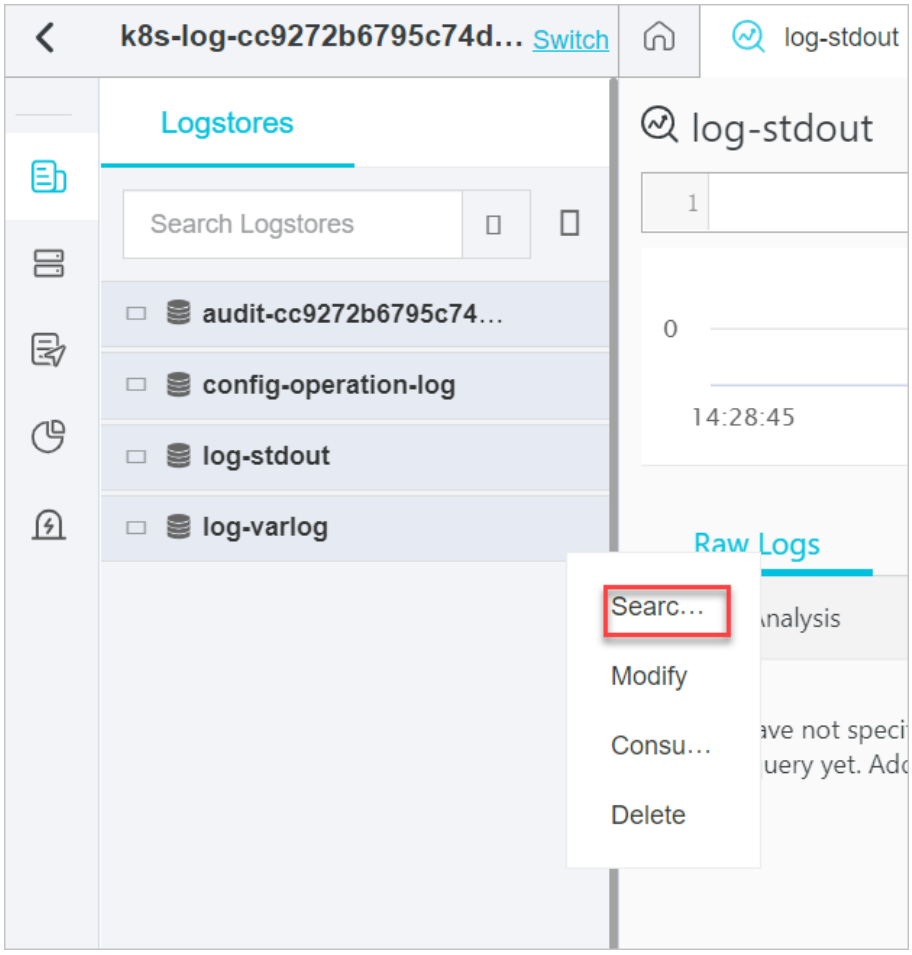
View logs

You can view the container log in the Log Service console.

1. Log on to the Log Service console. For more information, see Activate Log Service.
2. Click the project that is associated with the Kubernetes cluster. By default, the project name is in the format of k8s-log-{Kubernetes cluster ID}.
3. In the Logstore list, find the Logstore that is specified when you configure log collection. Move the pointer over the Logstore name and click the

   icon. Then, click **Search & Analysis**.
4. you can view the stdout and text log files of the container. You can also find that custom tags are appended to the collected log content.



After Log Service is enabled for the application, you can view the logs of containers in the Container Service console. Perform the following steps to view the logs of containers:

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Operations > Log Center**.
5. On the **Log Center** page, click the **Application Logs** tab and specify the filter conditions. Then, click **Select Logstore** to view the logs of containers.

3.1.6.11.2. Configure Log4jAppender for Kubernetes and Log Service

This topic describes how to configure a YAML file to export the log of a Container Service cluster to Log Service, without the need to modify the application. An application that can be managed by calling API operations is deployed in the cluster to generate the log for testing purposes.

Prerequisites

- A Container Service cluster is created. For more information, see Create a Kubernetes cluster.
- An AccessKey pair is created or Resource Access Management (RAM) is activated. Make sure that the required permissions are granted. In this example, an AccessKey pair is created.

Context

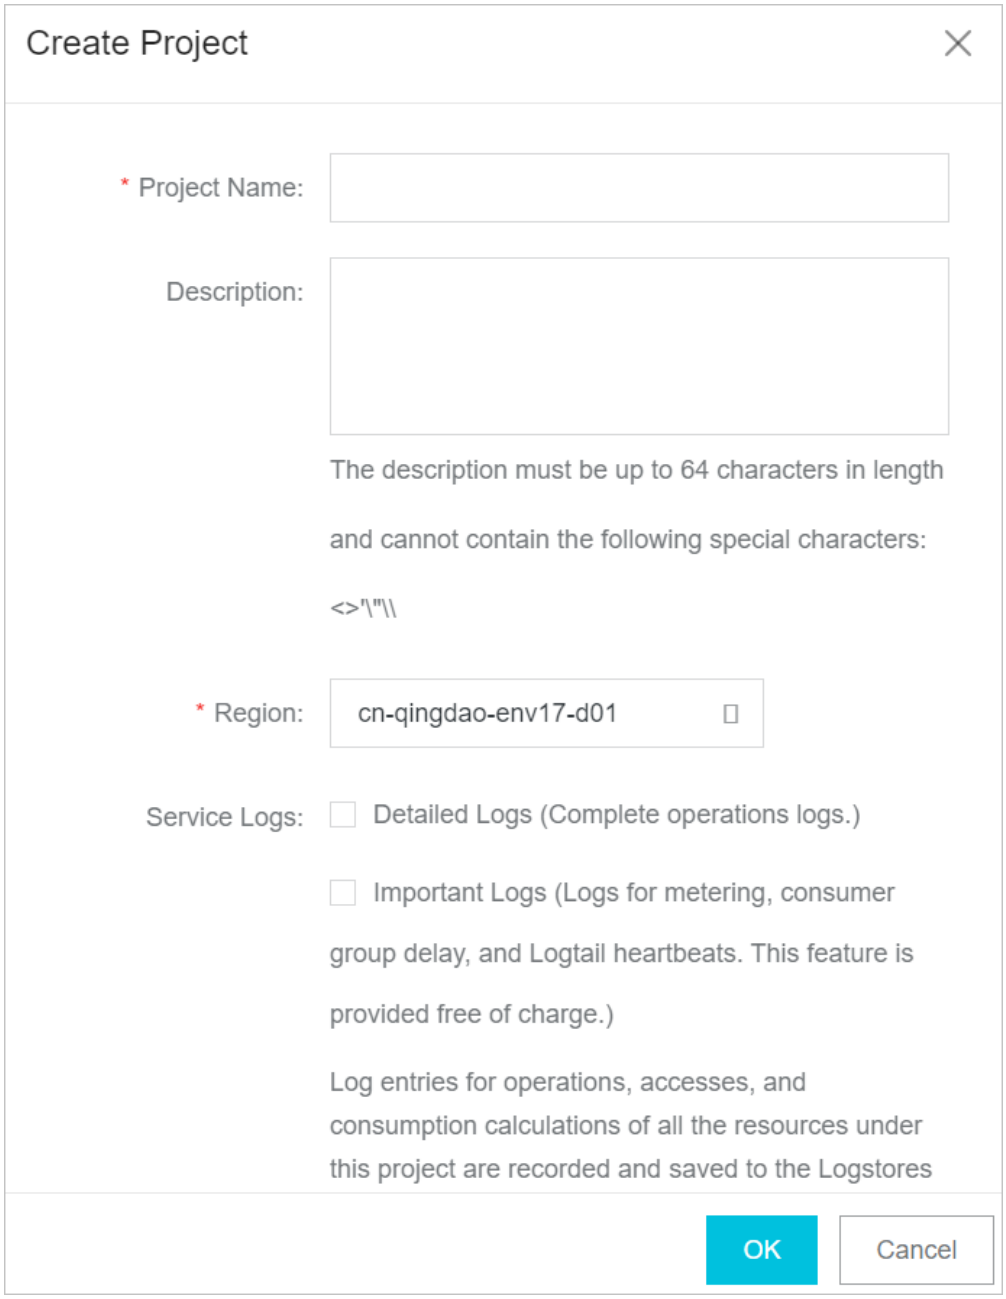
Log4j is an open source project of Apache. Log4j consists of three components: log level, log output destination, and log output format. You can configure Log4jAppender to export log data to the console, a log file, a GUI component, a socket server, an NT event viewer, or a UNIX syslog daemon.

Procedure

1. Configure Log4jAppender in Log Service.
   i. Create a project in Log Service.

      In this example, a Log Service project named k8s-log4j is created in the same region as your cluster. For more information, see the *Manage projects* chapter of *Log Service User Guide*.

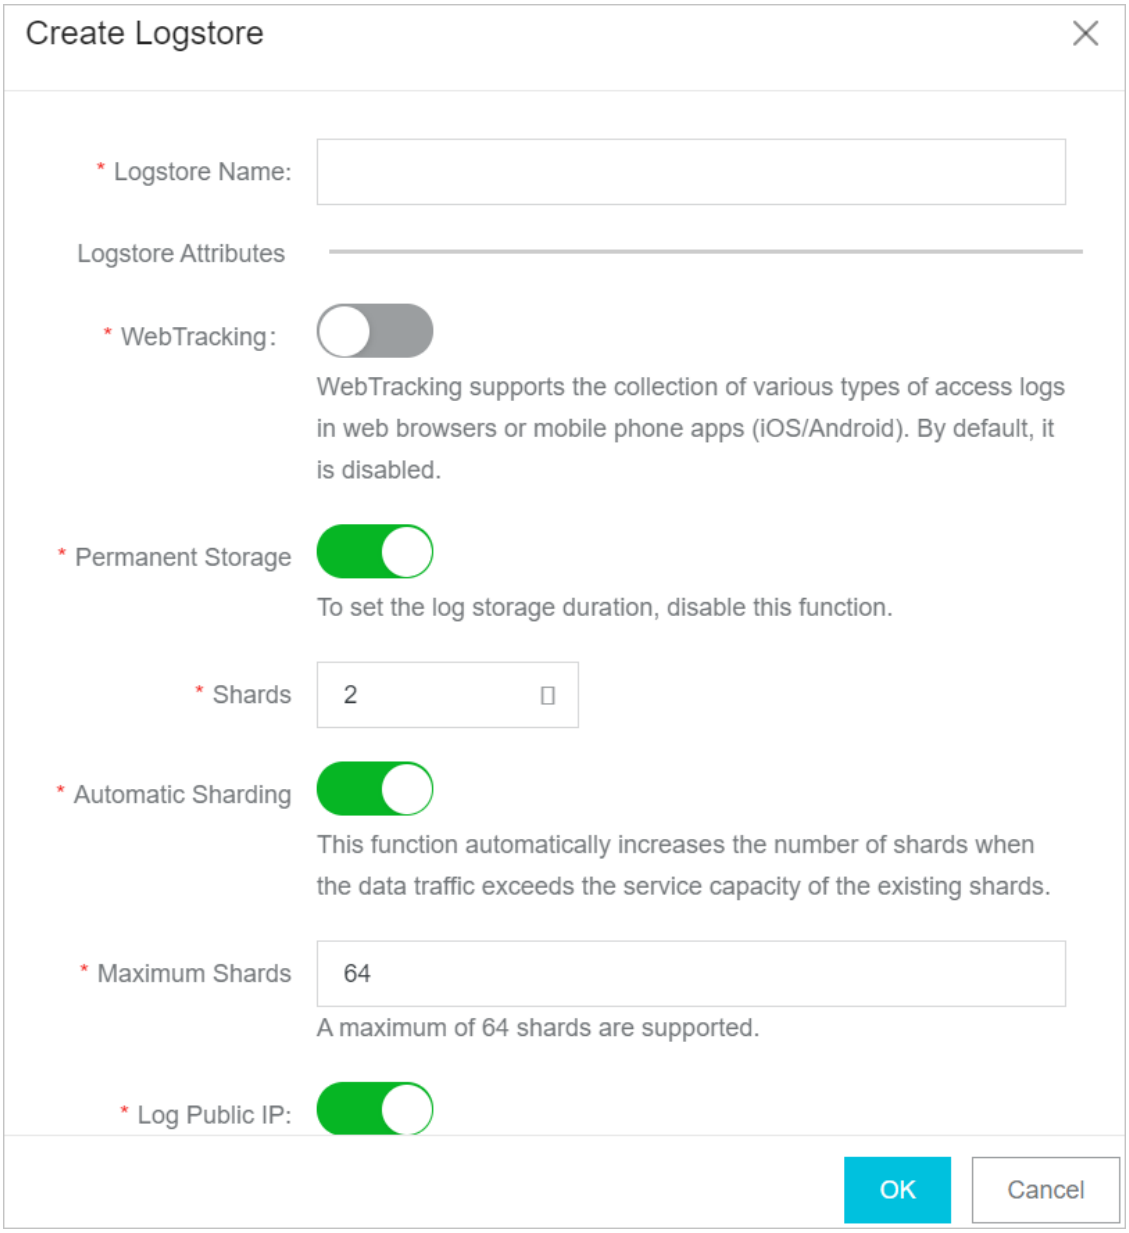
      > **Note** We recommend that you create a Log Service project in the same region as your cluster. When a Log Service project and a cluster are deployed in the same region, the log is transmitted over the internal network. This enables the real-time collection and quick retrieval of log data. This also avoids cross-region transmission, which requires additional bandwidth and time costs.



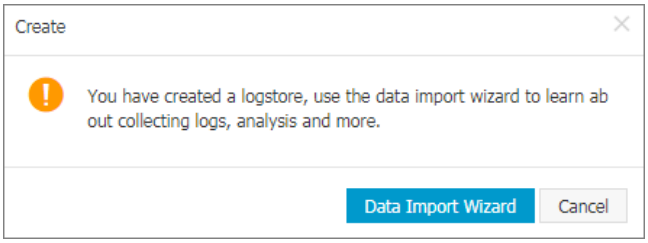
Create Project
* Project Name:
Description:
The description must be up to 64 characters in length and cannot contain the following special characters: <>'\"\\
* Region:
cn-qingdao-env17-d01
Service Logs:
Detailed Logs (Complete operations logs.)
Important Logs (Logs for metering, consumer group delay, and Logtail heartbeats. This feature is provided free of charge.)
Log entries for operations, accesses, and consumption calculations of all the resources under this project are recorded and saved to the Logstores
OK
Cancel

ii. Create a Logstore for the k8s-log4j project.

In this example, a Logstore named k8s-logstore is created. For more information, see the *Manage Logstores* chapter of *Log Service User Guide*.

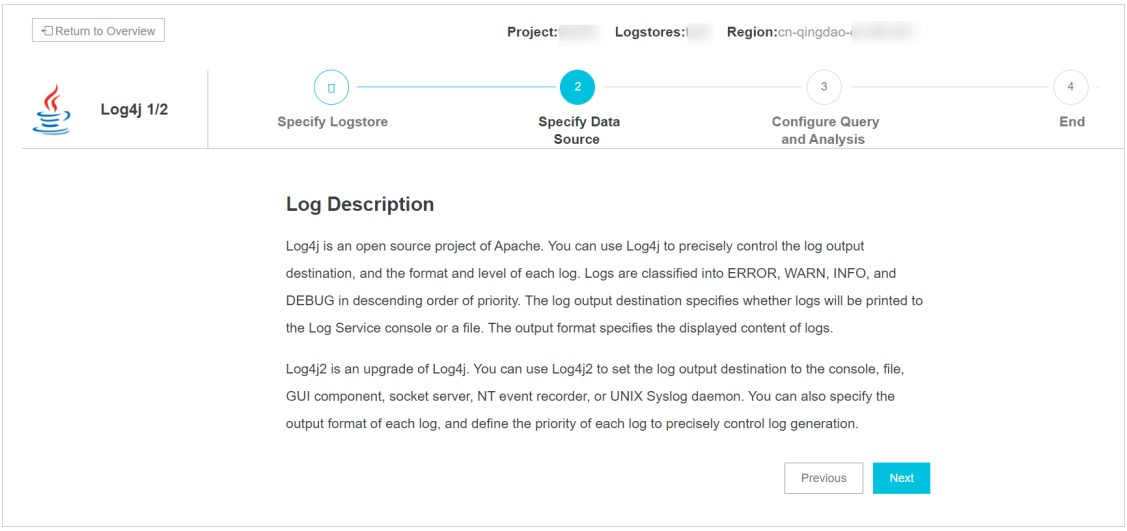


iii. After the k8s-logstore Logstore is created, a message appears, which prompts you to use the Data Import wizard. Click **Data Import Wizard**.



iv. At the top of the **Import Data** dialog box, click the **Custom Code** tab. Then, click Log4j and configure the data import parameters based on the instructions.

In this example, Log4jAppender is configured with the default settings. You can also customize the settings to meet your business requirements.



2. Configure Log4jAppender for the cluster.

In this example, the demo-deployment and demo-Service files are used.

i. Connect to your cluster. For more information, see Connect to a cluster through kubectl.

ii. Obtain the *demo-deployment.yaml* file and configure the `JAVA_OPTS` environment variable.

The following code is a sample template of the *demo-deployment.yaml* file:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: log4j-appender-demo-spring-boot
  labels:
    app: log4j-appender
spec:
  replicas: 1
  selector:
    matchLabels:
      app: log4j-appender
  template:
    metadata:
      labels:
        app: log4j-appender
    spec:
      containers:
      - name: log4j-appender-demo-spring-boot
        image: registry.cn-hangzhou.aliyuncs.com/jaegertracing/log4j-appender-demo-spring-boot
:0.0.2
        env:
          - name: JAVA_OPTS                ## Take note of this environment variable.
            value: "-Dproject={your_project} -Dlogstore={your_logstore} -Dendpoint={your_endpo
int} -Daccess_key_id={your_access_key_id} -Daccess_key={your_access_key_secret}"
        ports:
        - containerPort: 8080
```

Note The following information is displayed:

- `-Dproject`: the name of your Log Service project. In this example, the name of the project is k8s-log4j.
- `-DlogStore`: the name of your Logstore. In this example, the name of the Logstore is k8s-logstore.
- `-Dendpoint`: the endpoint of Log Service. You must configure the endpoint based on the region of your Log Service project. In this example, the endpoint is cn-hangzhou.log.aliyuncs.com.
- `-Daccess_key_id`: your AccessKey ID.
- `-Daccess_key`: your AccessKey secret.

iii. Run the following command to create a Deployment:

```
kubectl create -f demo-deployment.yaml
```

iv. Obtain the *demo-Service.yaml* file and run the following command to create a Service:

You do not need to modify the configurations in the *demo-Service.yaml* file.

```
kubectl create -f demo-service.yaml
```

3. Generate the log of the Kubernetes cluster log.

You can run the `kubectl get` command to view the deployment status of the related resource objects. After the Deployment and Service are deployed, run the `kubectl get svc` command to check the external IP address of the Service, which is the value of EXTERNAL-IP.

Run the following command:

```
kubectl get svc
```

Output:

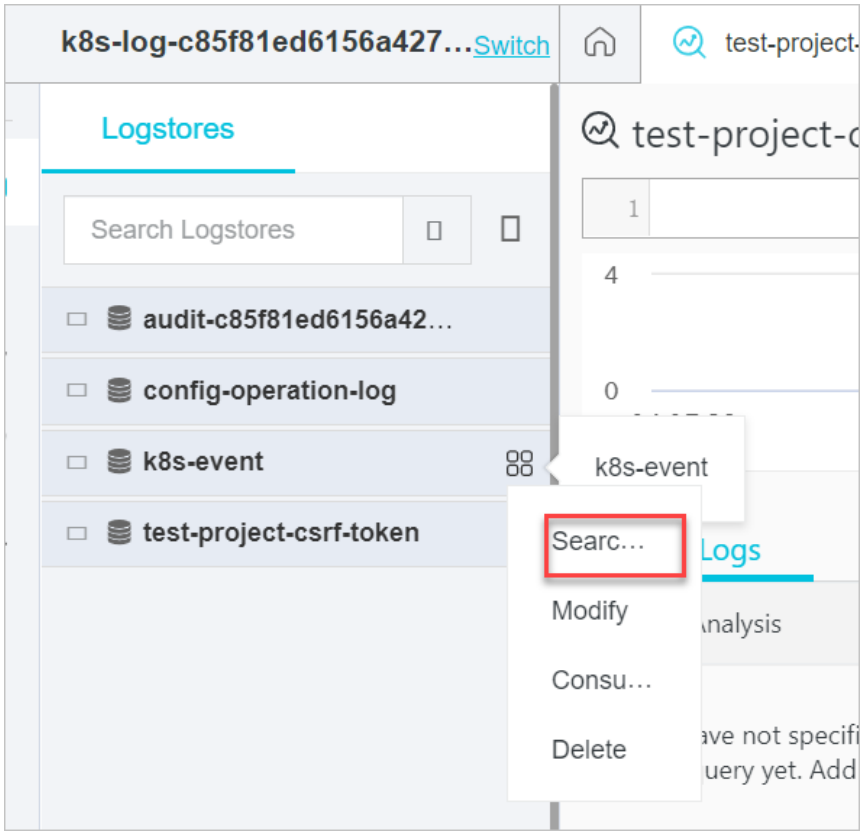
```
NAME                                TYPE           CLUSTER-IP     EXTERNAL-IP      PORT(S)
AGE
log4j-appender-demo-spring-boot-svc   LoadBalancer   172.21.XX.XX   120.55.XXX.XXX   8080:30398/TC
P   1h
```

In this example, you can run the `login` command to generate the log of the Kubernetes cluster log. Replace `K8S_SERVICE_IP` in the command with the value of `EXTERNAL-IP`.

> **Note** For a complete list of API operations, see GitHub log4j-appender-demo.

```
curl http://${K8S_SERVICE_IP}:8080/login?name=bruce
```

4. View the log in Log Service
   i. In the **Projects** list, click your Log Service project.
   ii. Click the icon to the right side of the k8s-logstore Logstore and select **Search & Analysis** to view the log of the Kubernetes cluster.



3.1.6.12. GPU

3.1.6.12.1. Create a dedicated Kubernetes cluster with GPU-accelerated nodes

This topic describes how to create a dedicated Kubernetes cluster with GPU-accelerated nodes.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Kubernetes Cluster** page, configure the basic settings.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ If the VPC does not have a NAT gateway, the system automatically creates one. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create SNAT rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different **zones**.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	You can select Docker or Sandboxed-Container.

Parameter	Description
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add up to three master nodes. ◦ Instance Type: You can select multiple instance types. For more information, see the *Instance families* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ◦ Instance Type: Select GPU-accelerated instance types. For more information, see the *Instance families* chapter of *ECS User Guide*. **Note** Select instance types from instance families whose names start with ecs.gn. ◦ Selected Types: The selected instance types are displayed. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ◦ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Alibaba Cloud Linux operating systems are supported.

Parameter	Description
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.
Internet access	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig files over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig files from within the VPC.
SSH Logon	To enable SSH logon, you must first select Expose API Server with EIP. ◦ If you select Use SSH to Access the Cluster from the Internet, you can access the cluster by using SSH. ◦ If you clear Use SSH to Access the Cluster from the Internet, you cannot access the cluster by using SSH or kubectl. If you want to access an Elastic Compute Service (ECS) instance in the cluster by using SSH, you must manually bind an EIP to the ECS instance and configure security group rules to open SSH port 22.
Security Group	You can select **Create Basic Security Group** or **Create Advanced Security Group**.

Parameter	Description
Ingress	Specify whether to **Install Ingress Controllers**. By default, **Install Ingress Controllers** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards. By default, **Install node-problem-detector and Create Event Center** is selected.
Monitoring Agents	Select or clear **Enable Prometheus Monitoring**. Prometheus Monitoring provides the basic monitoring of the cluster.
Volume Plug-in	By default, **CSI** is selected.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
Node Protection	This check box is selected by default to prevent nodes from being deleted in the console or by calling API operations.
Labels	Add labels to the cluster.

4. Configure the advanced settings.

Parameter	Description
IP Addresses per Node	The number of IP addresses that can be assigned to a node.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all worker nodes in the cluster.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster certification authority (CA) certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run scripts during instance startup. ○ Pass user data as common data into an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.

6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

3.1.6.12.2. Upgrade the NVIDIA driver on a GPU node

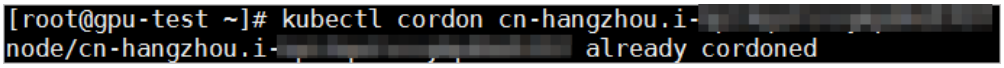
This topic describes how to upgrade the NVIDIA driver on a GPU node when workloads are deployed on the node and when no workload is deployed on the node.

Upgrade the NVIDIA driver on a GPU node where workloads are deployed

1. Connect to a Kubernetes cluster through kubectl.
2. Run the following command to set the target node to unschedulable.

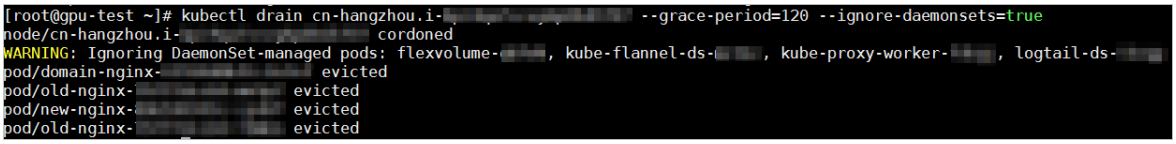
```
kubectl cordon node-name
```

> **Note**
>
> - Currently, you can only upgrade the NVIDIA driver on worker nodes.
> - *node-name* must be in the format of *your-region-name.node-id*.
>   - *your-region-name* represents the region where your cluster is deployed.
>   - *node-id* represents the ID of the ECS instance where the target node is deployed.
>
> You can run the following command to query *node-name*.
>
> ```
> kubectl get node
> ```



3. Run the following command to migrate pods from the target node to other nodes:

```
kubectl drain node-name --grace-period=120 --ignore-daemonsets=true
```



4. Run the following command to log on to the target node:

```
ssh root@xxx.xxx.x.xx
```

5. Run the following command to check the current NVIDIA driver version:

```
nvidia-smi
```

```
[root@ ~]# nvidia-smi
Fri Jan 18 16:44:52 2019
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 384.111                Driver Version: 384.111                   |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |
| Fan  Temp  Perf  Pwr:Usage/Cap|         Memory-Usage | GPU-Util  Compute M. |
|===============================+======================+======================|
|   0  Tesla P4            On   | 00000000:00:08.0 Off |                    0 |
| N/A   24C    P8     6W /  75W |      0MiB /  7606MiB |      0%      Default |
+-------------------------------+----------------------+----------------------+

+-----------------------------------------------------------------------------+
| Processes:                                                       GPU Memory |
|  GPU       PID   Type   Process name                             Usage      |
|=============================================================================|
|  No running processes found                                                 |
+-----------------------------------------------------------------------------+
```

6. Run the following commands to uninstall the existing driver:

   > **Note**
   > - If your driver version is *384.111*, perform the following steps.
   > - If your driver version is not *384.111*, download the corresponding driver from the official NVIDIA website first.

   ```
   cd /tmp
   ```

   ```
   curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
   ```

   ```
   chmod u+x NVIDIA-Linux-x86_64-384.111.run
   ```

   ```
   . /NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
   ```

7. Run the following command to restart the target node:

   ```
   reboot
   ```

8. Download the driver that you want to use from the official NVIDIA website. In this example, version *410.79* is used.
9. Run the following command to install the downloaded driver under the directory where it was saved:

   ```
   sh . /NVIDIA-Linux-x86_64-410.79.run -a -s -q
   ```

10. Run the following commands to configure the driver:

    ```
    nvidia-smi -pm 1 || true
    ```

    ```
    nvidia-smi -acp 0 || true
    ```

11. Run the following commands to update device-plugin:

    ```
    mv /etc/kubernetes/manifests/nvidia-device-plugin.yml /
    ```

    ```
    mv /nvidia-device-plugin.yml /etc/kubernetes/manifests/
    ```

12. Log on to a master node and run the following command to set the target node to schedulable:

    ```
    kubectl uncordon node-name
    ```

Result

Run the following command on a master node to check the NVIDIA driver version on the target node. The driver version is now *410.79*.

> **Note** Replace *node-name* with the target node name.

```
kubectl exec -n kube-system -t nvidia-device-plugin-node-name nvidia-smi
```

```
[root@gpu-test ~]#  kubectl exec -n kube-system -t nvidia-device-plugin-cn-[redacted] nvidia-smi
Mon Jan 21 03:14:48 2019
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 410.79       Driver Version: 410.79       CUDA Version: N/A      |

   ```

3. Run the following commands to uninstall the existing driver:

   > **Note**
   > - If your driver version is *384.111*, perform the following steps.
   > - If your driver version is not *384.111*, download the corresponding driver from the official NVIDIA website first.

```
cd /tmp
```

```
curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
```

```
chmod u+x NVIDIA-Linux-x86_64-384.111.run
```

```
. /NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

4. Run the following command to restart the target node.

```
reboot
```

5. Download the driver that you want to use from the official NVIDIA website. In this example, version *410.79* is used.
6. Run the following command to install the downloaded driver under the directory where it was saved:

```
sh . /NVIDIA-Linux-x86_64-410.79.run -a -s -q
```

7. Run the following commands to configure the driver:

```
nvidia-smi -pm 1 || true
```

```
nvidia-smi -acp 0 || true
```

Result

Run the following command on a master node to check the NVIDIA driver version on the target node. The driver version is now *410.79*.

> **Note** Replace *node-name* with the target node name.

```
kubectl exec -n kube-system -t nvidia-device-plugin-node-name nvidia-smi
```

```

```

3.1.6.12.3. Use cGPU to enable GPU sharing and scheduling

You can use the cGPU solution to schedule multiple applications to one GPU and isolate the GPU memory and computing power that are allocated to each application. This topic describes how to use cGPU to enable GPU sharing and scheduling.

Prerequisites

- A dedicated Kubernetes cluster with GPU-accelerated nodes is created. For more information, see Create a dedicated Kubernetes cluster with GPU-accelerated nodes.

- The Docker version used by the nodes is 19.03.5 or later. Docker versions earlier than 19.03.5 support GPU sharing but do not support GPU isolation.

Context

A key requirement of GPU sharing among multiple pods is to isolate the GPU memory and computing power that are allocated to each pod. When you run multiple containers on one GPU, the GPU resources are allocated to each container as requested. However, if one container occupies excessive GPU resources, the performance of the other containers may be affected. To address this issue, many solutions have been developed in the computing industry. Technologies, such as NVIDIA virtual GPU (vGPU), NVIDIA Multi-Process Service (MPS), rCUDA, and vCUDA, all contribute to fine-grained GPU resource allocation.

The cGPU solution uses the server kernel driver that is developed by Alibaba Cloud to provide more efficient use of the underlying drivers of NVIDIA GPUs. cGPU provides the following features:

- High compatibility: cGPU is compatible with standard open source solutions, such as Kubernetes and NVIDIA Docker.
- Ease of use: cGPU provides excellent user experience. To replace a Compute Unified Device Architecture (CUDA) library of an AI application, you do not need to recompile the application or create a new container image.
- Stability: cGPU provides stable underlying operations on NVIDIA GPUs. API operations on CUDA libraries and some private API operations on CUDA Deep Neural Network (cuDNN) are difficult to call.
- Resource isolation: cGPU ensures that the allocated GPU memory and computing power do not affect each other.

cGPU provides a cost-effective, reliable, and user-friendly solution that allows you to enable GPU scheduling and memory isolation.

Step 1: Create a node pool

Create a node pool and add the `cgpu=true` label to the node pool.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the cluster details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool**.
6. In the **Create Node Pool** dialog box, configure the node pool and click **Confirm Order**.

   For more information, see Create a Kubernetes cluster. The following list describes some of the parameters:

   - Name: the name of the node pool.
   - Quantity: the initial number of nodes in the node pool. If you do not want to add nodes to the node pool, set this parameter to 0.
   - ECS Label: Add labels to the Elastic Compute Service (ECS) instances.
   - Node Label: Click the  icon to add a label. Set the key to cgpu and the value to true.

7. Click **Submit**.

Step 2: Install ack-cgpu

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > App Catalog**.
3. On the **App Catalog** page, search for ack-cgpu and click ack-cgpu after it appears.
4. On the **App Catalog - ack-cgpu** page, select the cluster where you want to install ack-cgpu in the **Deploy** section and click **Create**.

> **Note** The default number of master nodes in a dedicated Kubernetes cluster is three. If the cluster has five master nodes, set the value of `masterCount` to `5`.

5. Verify that ack-cgpu is installed.
   i. In the left-side navigation pane, click **Clusters**.
   ii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iii. In the left-side navigation pane of the details page, choose **Workloads > Pods**.
   iv. At the top of the **Pods** page, set **Namespace** to kube-system. Enter gpushare in the search box and click the search icon. Check the pod status after it appears. If the **state** of the pod is Running or Completed, it indicates that ack-cgpu is installed.

Step 3: Verify GPU sharing and scheduling

1. Create a StatefulSet.
   i. Log on to the Container Service console.
   ii. In the left-side navigation pane, click **Clusters**.
   iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iv. On the cluster details page, choose **Workloads > StatefulSets**. On the right side of the StatefulSets page, click **Create from Template**.

v. Set **Sample Template** to **Custom**, copy the following code to the template, and then click **Create**.

```
apiVersion: apps/v1
kind: StatefulSet
metadata:
  name: cgpu-test
  labels:
    app: cgpu-test
spec:
  replicas: 3
  serviceName: "cgpu-test"
  podManagementPolicy: "Parallel"
  selector:
    matchLabels:
      app: cgpu-test
  template:
    metadata:
      labels:
        app: cgpu-test
    spec:
      containers:
      - name: cgpu-test
        image: registry.acs.intra.env115.shuguang.com/acs/gpushare-sample:tensorflow-1.5
        command:
          - python
          - cgpu/main.py
        resources:
          limits:
            aliyun.com/gpu-mem: 2 # Apply for 2 GiB of GPU memory.
```

Replace `registry.acs.intra.env115.shuguang.com` in the image address based on your business requirements. You can replace the image repository with that of the image used in Step .

If you want to use ack-cgpu to allocate GPU memory to a pod, you must specify the amount of GPU memory in the `resources` section. In this example, the amount is 2 GiB.

```
// Other settings are omitted.
......
        resources:
          limits:
            aliyun.com/gpu-mem: 2 # Apply for 2 GiB of GPU memory.
```

2. Check the amount of GPU memory allocated to the container.
   i. Log on to the Container Service console.
   ii. In the left-side navigation pane, click **Clusters**.
   iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iv. In the left-side navigation pane of the details page, choose **Workloads > StatefulSets**.
   v. On the **StatefulSets** page, click the newly created StatefulSet.
   vi. On the **Pods** tab, find the first pod and choose **Terminal > Container: cgpu-test** in the **Actions** column.
   vii. Run the `nvidia-smi -L` command to check the ID of the GPU used by the container.

viii. Run the `nvidia-smi` command to check the amount of GPU memory allocated to the container.

```
[redacted] nvidia-smi
Tue Jun  8 12:21:53 2021
+-----------------------------------------------------------------------------+
| NVIDIA-SMI 418.181.07   Driver Version: 418.181.07   CUDA Version: 10.1     |
|-------------------------------+----------------------+----------------------+
| GPU  Name        Persistence-M| Bus-Id        Disp.A | Volatile Uncorr. ECC |
| Fan  Temp  Perf  Pwr:Usage/Cap|         Memory-Usage | GPU-Util  Compute M. |
|===============================+======================+======================|
|   0  Tesla P4            On   | 00000000:00:07.0 Off |                    0 |
| N/A   46C    P0    23W /  75W |   1949MiB /  2174MiB |      2%      Default |
+-------------------------------+----------------------+----------------------+

+-----------------------------------------------------------------------------+
| Processes:                                                       GPU Memory |
|  GPU       PID   Type   Process name                             Usage      |
|=============================================================================|
+-----------------------------------------------------------------------------+
```

ix. Perform the preceding steps to check the GPU ID and amount of GPU memory of the second pod.

The results show that both pods have the same GPU ID. Each pod is allocated with 2,174 MiB of GPU memory.

> **Note** Pods have the same GPU ID only when they run on the same node. In this example, the cluster has only one GPU-accelerated node. Therefore, the two pods have to run on the same node.

x. Log on to a master node of the cluster. Run the following command to check the allocation details of the GPU resources of the node:

```
kubectl inspect cgpu
```

Expected output:

```
NAME      IPADDRESS       GPU0(Allocated/Total)  GPU Memory(GiB)
a52120c  192.168.52.120  6/7                    6/7
--------------------------------------------------
Allocated/Total GPU Memory In Cluster:
6/7 (85%)
```

The output shows that the cluster has 7 GiB of GPU memory in total and 6 GiB has been used.

The preceding results indicate that the pods use the same GPU and each pod is allocated with 2,174 MiB of GPU memory. This means that the allocated GPU resources are isolated among pods. The total GPU memory of one GPU is 7,611 MiB. You can run the `nvidia-smi` command on a node to obtain the total GPU memory of a GPU. If the allocated GPU resources are not isolated among pods, the amount of GPU memory allocated to a pod is 7,611 MiB. In this example, the actual amount of GPU memory allocated to a pod is 2,174 MiB, which is equal to 2 GiB as requested by the pod. This means the isolation takes effect.

3.1.6.12.4. GPU scheduling for Kubernetes clusters with GPU-accelerated nodes

This topic describes GPU scheduling for Kubernetes clusters with GPU-accelerated nodes.

Prerequisites

Container Service, Resource Orchestration Service (ROS), and Resource Access Management (RAM) are activated.

> **Note** Container Service uses ROS to deploy applications in Kubernetes clusters. To create a Kubernetes cluster, you must first activate ROS.

Context

Starting from version 1.8, Kubernetes adds support for the following hardware acceleration devices by using device plug-ins: NVIDIA GPUs, InfiniBand devices, and field-programmable gate arrays (FPGAs). GPU solutions developed by the community will be phased out in version 1.10, and removed from the master code in version 1.11. Container Service enables you to use a Kubernetes cluster with GPU-accelerated nodes to run compute-intensive tasks such as machine learning and image processing. You can deploy applications and achieve auto scaling without the need to install NVIDIA drivers or Compute Unified Device Architecture (CUDA) in advance.

The system performs the following operations when a Kubernetes cluster is created:

- Creates Elastic Compute Service (ECS) instances, configures a public key to enable Secure Shell (SSH) logon from master nodes to other nodes, and then configures the Kubernetes cluster through CloudInit.
- Creates a security group that allows access to the virtual private cloud (VPC) over Internet Control Message Protocol (ICMP).
- If you do not specify an existing VPC, the system creates a VPC and a vSwitch and creates SNAT entries for the vSwitch.
- Adds route entries to the VPC.
- Creates a NAT gateway and an elastic IP address (EIP).
- Creates a RAM user and grants it permissions to query, create, and delete ECS instances, and permissions to add and delete disks. The RAM user is also granted full permissions on Server Load Balancer (SLB) instances, CloudMonitor, VPC, Log Service, and Apsara File Storage NAS (NAS). The system also creates an AccessKey pair for the RAM user. The system automatically creates SLB instances, disks, and VPC route entries based on your configuration.
- Creates an internal-facing SLB instance and opens port 6443.
- Creates an Internet-facing SLB instance and open ports 6443, 8443, and 22. If you enable SSH logon when you create the cluster, port 22 is open. Otherwise, port 22 is not open.

Limits

- Kubernetes clusters support only VPCs.
- By default, you can create only a limited amount of cloud resources with each account. You cannot create clusters if the quota on clusters is reached. Make sure that you have sufficient quota before you create a cluster. To request a quota increase, submit a ticket.
  - By default, you can create at most five clusters across all regions with each account. Each cluster can contain at most 40 nodes. To increase the quota of clusters or nodes, submit a ticket.

    > **Note** In a Kubernetes cluster, you can create at most 48 route entries for each VPC. This means that a cluster can contain at most 48 nodes. To increase the quota of nodes, submit a ticket to increase the quota of route entries first.

  - By default, you can create at most 100 security groups with each account.
  - By default, you can create at most 60 pay-as-you-go SLB instances with each account.
  - By default, you can create at most 20 EIPs with each account.
- Limits on ECS instances:

  Only CentOS is supported.

Create a GN5 Kubernetes cluster

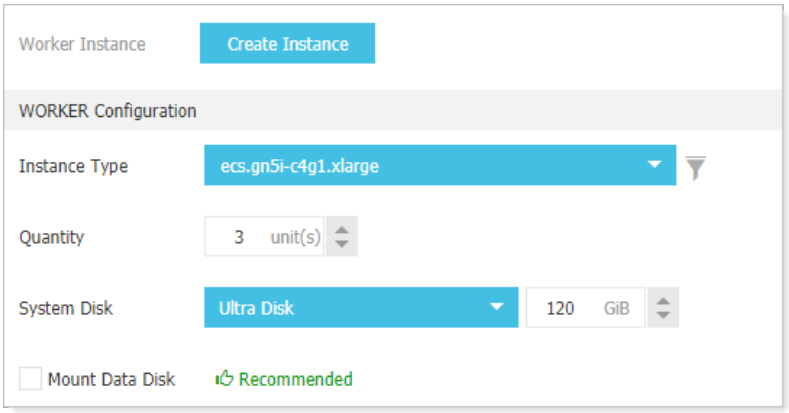
GN5 Kubernetes clusters support only Kubernetes 1.12.6-aliyun.1. Kubernetes 1.11.5 is not supported.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. In the upper-right corner of the **Clusters** page, click **Create Kubernetes Cluster**.

On the cluster configuration page, set the parameters.

> **Note** To create a cluster with GPU-accelerated nodes, select GPU-accelerated ECS instance types as worker nodes. For more information about other parameters, see Cluster parameters.

4. Configure worker nodes. In this example, worker nodes are used to run GPU computing tasks and the gn5i-c4gi1 instance type is selected.
   i. If you choose to create worker instances, you must set Instance Type and Quantity. In this example, three GPU-accelerated worker nodes are created.



> **Note** We recommend that you use standard SSDs.

   ii. If you choose to add existing instances, you must create GPU-accelerated ECS instances in the region where you want to create the cluster in advance.

5. Specify the other parameters and click **Create Cluster** to start the deployment.

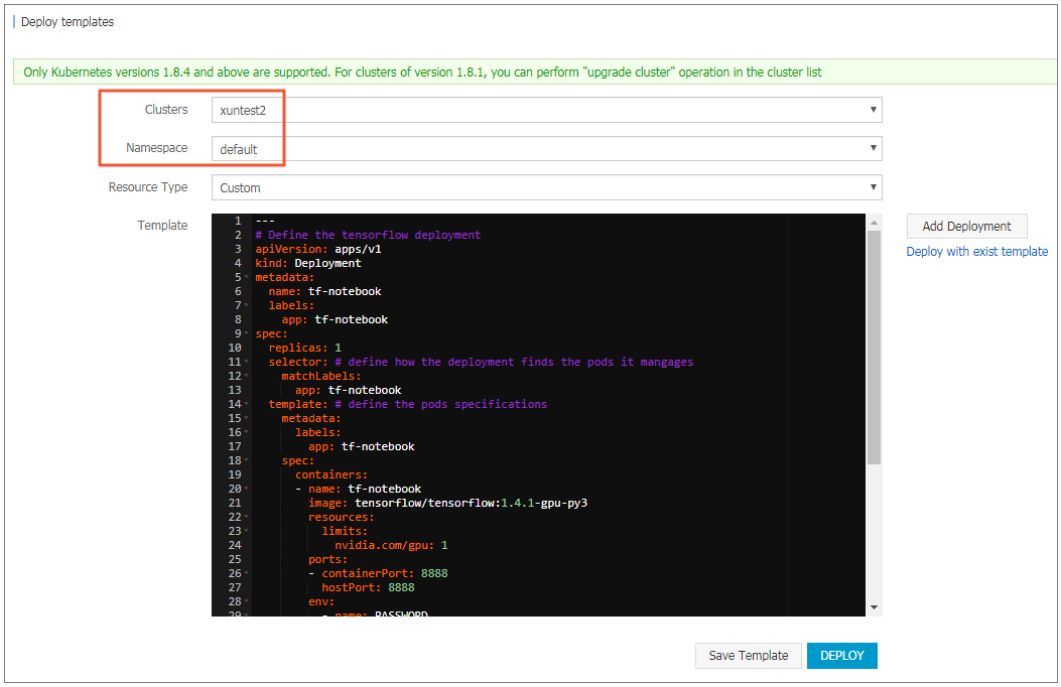
   After the cluster is created, choose **Clusters > Nodes** to go to the Nodes page.

   Select a worker nodes that was configured for the cluster and choose **More > Details** in the Actions column to view the GPU devices that are attached to the node.

Create a GPU experimental environment to run TensorFlow

Jupyter is a standard tool that is used by data scientists to create an experimental environment to run TensorFlow. The following example shows how to deploy a Jupyter application.

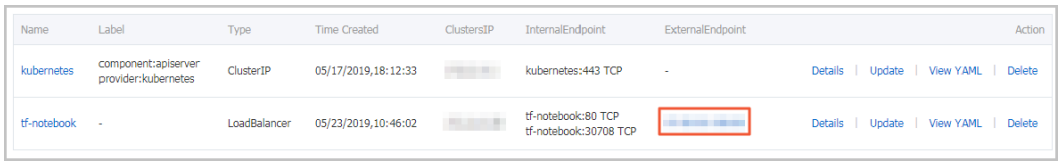
1. Log on to the Container Service console. In the left-side navigation pane, choose **Applications > Deployments** to go to the **Deployments** page.
2. In the upper-right corner of the page, click **Create from Template**.
3. Select the required cluster and namespace. Select a sample template, or set Sample Template to Custom and customize the template in the Template field. Then, click **Create** to create the application.



In this example, the template uses a Deployment and a Service to create a Jupyter application.

```
---
# Define the tensorflow deployment
apiVersion: apps/v1
kind: Deployment
metadata:
  name: tf-notebook
  labels:
    app: tf-notebook
spec:
  replicas: 1
  selector: # define how the deployment finds the pods it manages
    matchLabels:
      app: tf-notebook
  template: # define the pods specifications
    metadata:
      labels:
        app: tf-notebook
    spec:
      containers:
      - name: tf-notebook
        image: tensorflow/tensorflow:1.4.1-gpu-py3
        resources:
          limits:
            nvidia.com/gpu: 1                    #The number of NVIDIA GPUs that are requested b
y the application.
        ports:
        - containerPort: 8888
          hostPort: 8888
        env:
          - name: PASSWORD                       #The password that is used to access the Jupyte
r application. You can modify the password as required.
            value: mypassw0rd
# Define the tensorflow service
---
apiVersion: v1
kind: Service
metadata:
  name: tf-notebook
spec:
  ports:
  - port: 80
    targetPort: 8888
    name: jupyter
  selector:
    app: tf-notebook
  type: LoadBalancer                           #An SLB instance is used to route internal traffic
and perform load balancing.
```

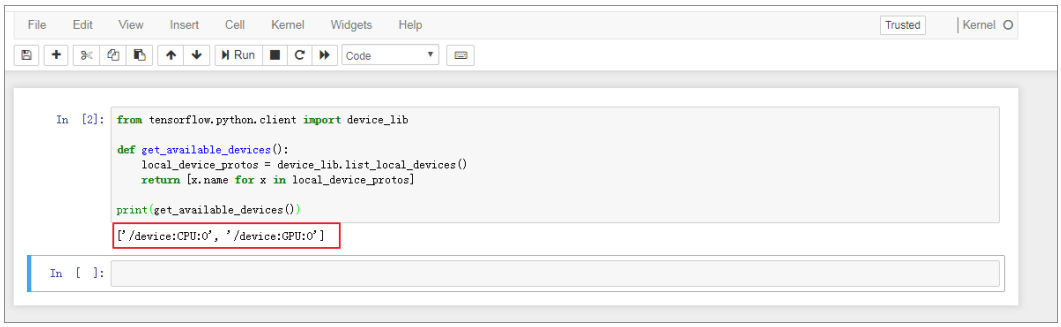
4. In the left-side navigation pane, choose **Ingresses and Load Balancing > Services**. Select the required cluster and namespace, find the tf-notebook Service, and then check its external endpoint.



5. To connect to the Jupyter application, enter `http://EXTERNAL-IP` into the address bar of your browser and enter the password specified in the template.

6. You can run the following program to verify that the Jupyter application is allowed to use GPU resources. The program lists all devices that can be used by TensorFlow:

```
from tensorflow.python.client import device_lib
def get_available_devices():
    local_device_protos = device_lib.list_local_devices()
    return [x.name for x in local_device_protos]
print(get_available_devices())
```



3.1.6.12.5. Use labels to schedule pods to GPU-accelerated nodes

To use Kubernetes clusters for GPU computing, you must schedule pods to GPU-accelerated nodes. Container Service allows you to schedule pods to specific GPU-accelerated nodes by adding labels to the GPU-accelerated nodes.

Context

When Kubernetes deploys nodes with NVIDIA GPUs, the attributes of these GPUs are discovered and exposed as node labels. These labels have the following benefits:

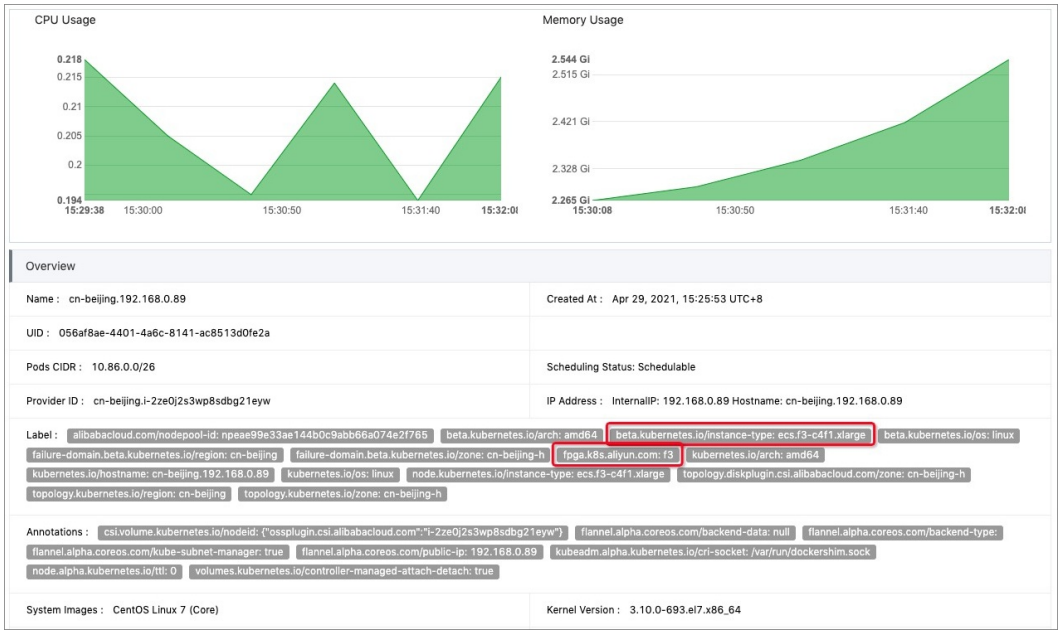
- You can use the labels to filter GPU-accelerated nodes.
- The labels can be used as conditions to schedule pods.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.

   > **Note** In this example, the Kubernetes cluster contains three master nodes, among which two are equipped with GPUs. Record the node IP addresses.

5. On the **Nodes** page, select the node that is equipped with GPUs and choose **More > Details** in the Actions column to view the labels that are added to the node.



You can also log on to a master node and run the following command to view the labels of GPU-accelerated nodes:

```
# kubectl get nodes
NAME                                 STATUS    ROLES     AGE       VERSION
cn-beijing.i-2ze2dy2h9w97v65u****    Ready     master    2d        v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a****    Ready     <none>    2d        v1.12.6-aliyun.1            # C
ompare these nodes with the nodes displayed in the console to identify GPU-accelerated nodes.
cn-beijing.i-2ze8o1a45qdv5q8a****    Ready     <none>    2d        v1.12.6-aliyun.1
cn-beijing.i-2ze9xylyn11vop7g****    Ready     master    2d        v1.12.6-aliyun.1
cn-beijing.i-2zed5sw8snjniq6m****    Ready     master    2d        v1.12.6-aliyun.1
cn-beijing.i-2zej9s0zijykp9pw****    Ready     <none>    2d        v1.12.6-aliyun.1
```

Select a GPU-accelerated node and run the following command to query the labels of the node:

```
# kubectl describe node cn-beijing.i-2ze8o1a45qdv5q8a****
Name:               cn-beijing.i-2ze8o1a45qdv5q8a7luz
Roles:              <none>
Labels:             aliyun.accelerator/nvidia_count=1                          #Note
                    aliyun.accelerator/nvidia_mem=12209MiB
                    aliyun.accelerator/nvidia_name=Tesla-M40
                    beta.kubernetes.io/arch=amd64
                    beta.kubernetes.io/instance-type=ecs.gn4-c4g1.xlarge
                    beta.kubernetes.io/os=linux
                    failure-domain.beta.kubernetes.io/region=cn-beijing
                    failure-domain.beta.kubernetes.io/zone=cn-beijing-a
                    kubernetes.io/hostname=cn-beijing.i-2ze8o1a45qdv5q8a****
 ......
```

In this example, the following labels are added to the GPU-accelerated node.

key	value
`aliyun.accelerator/nvidia_count`	The number of GPU cores.
`aliyun.accelerator/nvidia_mem`	The size of the GPU memory. Unit: MiB.

key	value
`aliyun.accelerator/nvidia_name`	The name of the NVIDIA GPU.

GPU-accelerated nodes of the same type have the same GPU name. You can use this label to locate GPU-accelerated nodes.

```
# kubectl get no -l aliyun.accelerator/nvidia_name=Tesla-M40
NAME                                STATUS    ROLES     AGE       VERSION
cn-beijing.i-2ze8o1a45qdv5q8a****   Ready     <none>    2d        v1.12.6-aliyun.1
cn-beijing.i-2ze8o1a45qdv5q8a****   Ready     <none>    2d        v1.12.6-aliyun.1
```

6. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
7. On the **Deployments** page, select the namespace and click **Create from Template** in the upper-right corner.
8. Create a Deployment for a TensorFlow job. The Deployment is used to schedule pods to a GPU-accelerated node.
9. You can also exclude an application from GPU-accelerated nodes. The following example shows how to schedule a pod based on node affinity for an NGINX application. For more information, see the section that describes node affinity in Create an application from an image.

   The following YAML template is used as an example:

```
apiVersion: v1
kind: Pod
metadata:
  name: not-in-gpu-node
spec:
  affinity:
    nodeAffinity:
      requiredDuringSchedulingIgnoredDuringExecution:
        nodeSelectorTerms:
        - matchExpressions:
          - key: aliyun.accelerator/nvidia_name
            operator: DoesNotExist
  containers:
  - name: not-in-gpu-node
    image: nginx
```

Result

In the left-side navigation pane of the details page, choose **Workloads > Pods**. On the Pods page, select the namespace to view pods created in the namespace. On the Pods page, you can find that the pods in the preceding examples are scheduled to the desired nodes. This means that labels can be used to schedule pods to GPU-accelerated nodes.

3.1.6.12.6. Manually upgrade the kernel of a GPU node in a cluster

This topic describes how to manually upgrade the kernel of a GPU node in a cluster.

Context

The current kernel version is earlier than `3.10.0-957.21.3`.

Procedure

1. Connect to a Kubernetes cluster through kubectl.
2. Run the following command to set the target GPU node to unschedulable. This example uses node cn-beijing.i-2ze19qyi8votgjz12345 as the target node.

```
kubectl cordon cn-beijing.i-2ze19qyi8votgjz12345
node/cn-beijing.i-2ze19qyi8votgjz12345 already cordoned
```

3. Run the following command to drain the target GPU node:

```
# kubectl drain cn-beijing.i-2ze19qyi8votgjz12345 --grace-period=120 --ignore-daemonsets=true
node/cn-beijing.i-2ze19qyi8votgjz12345 cordoned
WARNING: Ignoring DaemonSet-managed pods: flexvolume-9scb4, kube-flannel-ds-r2qmh, kube-proxy-worker-l62sf, logtail-ds-f9vbg
pod/nginx-ingress-controller-78d847fb96-5fkkw evicted
```

4. Uninstall the existing nvidia-driver.

> **Note** This step uninstalls the version 384.111 driver. If your driver version is not 384.111, you need to download a driver from the official NVIDIA website and replace `384.111` with your actual version number.

   i. Log on to the target GPU node and run the `nvidia-smi` command to query the driver version.

```
# nvidia-smi -a | grep 'Driver Version'
Driver Version                      : 384.111
```

   ii. Run the following commands to download the driver installation package:

```
cd /tmp/
curl -O https://cn.download.nvidia.cn/tesla/384.111/NVIDIA-Linux-x86_64-384.111.run
```

> **Note** The installation package is required to uninstall the driver.

   iii. Run the following commands to uninstall the existing nvidia-driver:

```
chmod u+x NVIDIA-Linux-x86_64-384.111.run
. /NVIDIA-Linux-x86_64-384.111.run --uninstall -a -s -q
```

5. Run the following commands to upgrade kernel:

```
yum clean all && yum makecache
yum update kernel  -y
```

6. Run the following command to restart the GPU node:

```
reboot
```

7. Log on to the GPU node and run the following command to install the kernel-devel package.

```
yum install -y kernel-devel-$(uname -r)
```

8. Run the following commands to download the required driver and install it on the target node. In this example, version 410.79 is used.

```
cd /tmp/
curl -O https://cn.download.nvidia.cn/tesla/410.79/NVIDIA-Linux-x86_64-410.79.run
chmod u+x NVIDIA-Linux-x86_64-410.79.run
sh . /NVIDIA-Linux-x86_64-410.79.run -a -s -q
# warm up GPU
nvidia-smi -pm 1 || true
nvidia-smi -acp 0 || true
nvidia-smi --auto-boost-default=0 || true
nvidia-smi --auto-boost-permission=0 || true
nvidia-modprobe -u -c=0 -m || true
```

9. Check the */etc/rc.d/rc.local* file and check whether the following configurations are included. If not, add the following content.

```
nvidia-smi -pm 1 || true
nvidia-smi -acp 0 || true
nvidia-smi --auto-boost-default=0 || true
nvidia-smi --auto-boost-permission=0 || true
nvidia-modprobe -u -c=0 -m || true
```

10. Run the following commands to restart kubelet and Docker.

```
service kubelet stop
service docker restart
service kubelet start
```

11. Run the following command to set the GPU node to schedulable:

```
# kubectl uncordon cn-beijing.i-2ze19qyi8votgjz12345
node/cn-beijing.i-2ze19qyi8votgjz12345 already uncordoned
```

12. Run the following command on the nvidia-device-plugin container to check the driver version:

```
kubectl exec -n kube-system -t nvidia-device-plugin-cn-beijing.i-2ze19qyi8votgjz12345 nvidia-smi
Thu Jan 17 00:33:27 2019
+-----------------------------------------------------------------------------+

+-----------------------------------------------------------------------------+
```

3.1.6.13. Auto scaling

3.1.6.13.1. Auto scaling of nodes

Container Service provides the auto scaling component to automatically scale the number of nodes. Regular instances and GPU-accelerated instances can be automatically added to or removed from a Container Service cluster to meet your business requirements. This component supports multiple scaling modes, various instance types, and instances that are deployed across zones. This component is applicable to diverse scenarios.

How it works

The auto scaling model of Kubernetes is different from the traditional scaling model that is based on the resource usage threshold. Developers must understand the differences between the two scaling models before they migrate workloads from traditional data centers or other orchestration systems such as Swarm to Kubernetes.

The traditional scaling model is based on resource usage. For example, if a cluster contains three nodes and the CPU utilization or memory usage of the nodes exceeds the scaling threshold, new nodes are added to the cluster. However, you must consider the following issues when you use the traditional scaling model:

- How do you set a proper scaling threshold and how does the system check whether the threshold is exceeded?

  In a Kubernetes cluster, the resource usage of hot nodes is higher than that of other nodes. If you specify the average resource usage as the scaling threshold, scaling activities may not be promptly triggered. If you specify the lowest node resource usage as the scaling threshold, the newly added nodes may not be used. This causes a waste of resources.

- How are the loads balanced after new nodes are added?

  In Kubernetes, pods are the smallest deployable units for applications. Pods are deployed on different nodes in a Kubernetes cluster. When auto scaling is triggered for a cluster or a node in the cluster, pods with high resource usage are not replicated and the resource limits of these pods are not changed. As a result, the loads cannot be balanced to newly added nodes.

- How do you determine whether scaling activities must be triggered and how are scaling activities performed?

  If scale-in activities are triggered based on resource usage, pods that request large amounts of resources but have low resource usage may be evicted. If the number of these pods is large within a Kubernetes cluster, resources may be exhausted and some pods may fail to be scheduled.

How does the auto scaling model of Kubernetes fix these issues? Kubernetes provides a two-layer scaling model that decouples pod scheduling from resource scaling.

In simple terms, pods are scaled based on resource usage. When pods enter the Pending state due to insufficient resources, a scale-out activity is triggered. After new nodes are added to the cluster, the pending pods are automatically scheduled to the newly added nodes. This way, the loads of the application are balanced. The following section describes the auto scaling model of Kubernetes in detail:

- How is a scale-out activity triggered?

  The cluster-autoscaler component scans for pending pods and then triggers scaling activities. When pods enter the Pending state due to insufficient resources, cluster-autoscaler simulates pod scheduling to decide the scaling group that can provide new nodes to accept the pending pods. If a scaling group meets the requirement, nodes from this scaling group are added to the cluster. In simple terms, a scaling group is treated as a node during the simulation. The instance type of the scaling group specifies the CPU, memory, and GPU resources of the node. The labels and taints of the scaling group are also applied to the node. The node is used to simulate the scheduling of the pending pods. If the pending pods can be scheduled to the node, cluster-autoscaler calculates the number of nodes that need to be added from the scaling group.

- How is a scale-in activity triggered?

  Only nodes that are added by scaling activities can be removed by cluster-autoscaler. This component cannot manage static nodes. Each node is separately evaluated to determine whether the node needs to be removed. If the resource usage of a node drops below the scale-in threshold, a scale-in activity is triggered for the node. In this case, cluster-autoscaler simulates the eviction of all workloads on the node to determine whether the node can be completely drained. cluster-autoscaler does not drain the nodes that contain specific pods, such as non-DaemonSet pods in the kube-system namespace and pods that are controlled by PodDisruptionBudgets (PDBs). A node is drained before it is removed. After pods on the node are evicted to other nodes, the node can be removed.

- How is a scaling group selected from multiple scaling groups that meet the requirements?

Different scaling groups are treated as nodes in different specifications. cluster-autoscaler selects a scaling group based on a scoring policy that is similar to a scheduling policy. Nodes are first filtered by the scheduling policy. Among the filtered nodes, the nodes that conform to policies, such as affinity settings, are selected. If no scheduling policy or affinity settings are configured, cluster-autoscaler selects a scaling group based on the least-waste policy. The least-waste policy selects the scaling group that has the fewest idle resources after simulation. If a scaling group of CPU-accelerated nodes and a scaling group of GPU-accelerated nodes both meet the requirements, the scaling group of CPU-accelerated nodes is selected by default.

- How can the success rate of auto scaling be increased? The success rate of auto scaling depends on the following factors:
  - Whether the scheduling policy is met

    After you configure a scaling group, you must be aware of the pod scheduling policies that the scaling group supports. If you are unaware of the pod scheduling policies, you can simulate a scaling activity by using the node selectors of pending pods and the labels of the scaling group.
  - Whether resources are sufficient

    After the scaling simulation is complete, a scaling group is selected. However, the scaling activity fails if the specified types of Elastic Compute Service (ECS) instances in the scaling group are out of stock. To increase the success rate of auto scaling, you can select different types of instances in more than one zone.
- How can auto scaling be accelerated?
  - Method 1: Perform auto scaling in swift mode. After a scaling group experiences a scale-in activity and a scale-out activity, the swift mode is enabled for the scaling group.
  - Method 2: Use custom images that are created from the base image of Alibaba Cloud Linux 2 (formerly known as Aliyun Linux 2). This ensures that the resources of Infrastructure as a Service (IaaS) are delivered 50% faster.

Considerations

- For each account, the default CPU quota for pay-as-you-go instances in each region is 50 vCPUs. You can add at most 48 custom route entries to each route table of a virtual private cloud (VPC). To request a quota increase, submit a ticket.
- The stock of ECS instances may be insufficient for auto scaling if you specify only one ECS instance type for a scaling group. We recommend that you specify multiple ECS instance types with the same specification for a scaling group. This increases the success rate of auto scaling.
- In swift mode, when a node is shut down and reclaimed, the node stops running and enters the *NotReady* state. When a scale-out activity is triggered, the state of the node changes to *Ready*.
- If a node is shut down and reclaimed in swift mode, you are charged only for the disks. This rule does not apply to nodes that use local disks, such as the instance type of ecs.d1ne.2xlarge, for which you are also charged a computing fee. If the stock of nodes is sufficient, nodes can be launched within a short period of time.
- If elastic IP addresses (EIPs) are associated with pods, we recommend that you do not delete the scaling group or remove ECS instances from the scaling group in the ECS console. Otherwise, these EIPs cannot be automatically released.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the Clusters page, find the cluster that you want to manage and choose **More > Auto Scaling** in the **Actions** column.
4. On the **Configure Auto Scaling** page, set the following parameters and click **Submit**.

Parameter	Description
Cluster	The name of the cluster for which you want to enable auto scaling.

Parameter	Description
Scale-in Threshold	For a scaling group that is managed by cluster-autoscaler, set the value to the ratio of the requested resources per node to the total resources per node. If the actual value is lower than the threshold, the node is removed from the cluster. **Note** In auto scaling, a scale-out activity is automatically triggered based on node scheduling. Therefore, you need to set only scale-in parameters.
GPU Scale-in Threshold	The scale-in threshold for GPU-accelerated instances. If the actual value is lower than the threshold, the node is removed from the cluster.
Defer Scale-in For	The amount of time that the cluster must wait before the cluster scales in. The default value is 10 minutes.
Cooldown	The cooldown period after a scale-in activity is triggered. No scale-in activity is triggered during the cooldown period. The default value is 10 minutes.

5. Click **Create Scaling Group** and specify the type of resource for auto scaling based on your business requirements. Regular instances and GPU-accelerated instances are supported.
6. In the **Auto Scaling Group Configuration** dialog box, set the following parameters.

Parameter	Description
Region	The region where you want to deploy the scaling group. The scaling group and the Kubernetes cluster must be deployed in the same region. You cannot change the region after the scaling group is created.
VPC	The scaling group and the Kubernetes cluster must be deployed in the same VPC.
VSwitch	The vSwitches of the scaling group. You can specify vSwitches of different zones. The vSwitches allocate pod CIDR blocks to the scaling group.

7. Configure worker nodes.

Parameter	Description
Instance Type	The instance types in the scaling group.
Selected Types	The instance types that you select. You can select at most 10 instance types.
System Disk	The system disk of the scaling group.
Mount Data Disk	Specify whether to mount data disks to the scaling group. By default, no data disk is mounted.

Parameter	Description
Instances	The number of instances contained in the scaling group. **Note** ◦ Existing instances in the cluster are excluded. ◦ By default, the minimum number of instances is 0. If you specify one or more instances, the system adds the instances to the scaling group. When a scale-out activity is triggered, the instances in the scaling group are added to the cluster to which the scaling group is bound.
Password	Use a password. ◦ Password: Enter the password that is used to log on to the nodes. ◦ Confirm Password: Enter the password again.
Scaling Mode	You can select **Standard** or **Swift**.
RDS Whitelist	The ApsaraDB RDS instances that can be accessed by the nodes in the scaling group after a scaling activity is triggered.
Label	Labels are automatically added to nodes that are added to the cluster by scale-out activities.
ECS Label	You can add labels to the selected ECS instances.
Taints	After you add taints to a node, Container Service no longer schedules pods to the node.
CPU Policy	Specify the CPU policy. Valid values: ◦ None: indicates that the default CPU affinity is used. This is the default policy. ◦ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.

8. Set advanced options.

Parameter	Description
Custom Security Group	Set a custom security group.
Custom Image	You can select a custom image. Then, all nodes in the Kubernetes cluster are deployed based on the image.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ◦ Run scripts during instance startup. ◦ Import user data as normal data to an ECS instance for future reference.

9. Click **OK**.

Check the results

In the left-side navigation pane, choose **Applications > Deployments**, select the kube-system namespace. You can find the cluster-autoscaler component. This indicates that the scaling group is created.

FAQ

- Why does the auto scaling component fail to add nodes after a scale-out activity is triggered?

  Check whether the following situations exist:

  - The instance types in the scaling group cannot fulfill the resource request from pods. By default, system components are installed for each node. Therefore, the requested pod resources must be less than the resource capacity of the instance type.
  - The Resource Access Management (RAM) role does not have the permissions to manage the Kubernetes cluster. You must complete the authorization for each Kubernetes cluster that is involved in the scale-out activity.
  - The Kubernetes cluster cannot connect to the Internet. The auto scaling component must call Alibaba Cloud API operations. Therefore, the nodes must have access to the Internet.

- Why does the auto scaling component fail to remove nodes after a scale-in activity is triggered?

  Check whether the following situations exist:

  - The requested resource threshold of each pod is higher than the configured scale-in threshold.
  - Pods that belong to the *kube-system* namespace are running on the node.
  - A scheduling policy forces the pods to run on the current node. Therefore, the pods cannot be scheduled to other nodes.
  - PodDisruptionBudget is set for the pods on the node and the minimum value of PodDisruptionBudget is reached.

  For more information about FAQ, see open source component.

- How does the system choose a scaling group for a scaling activity?

  When pods cannot be scheduled to nodes, the auto scaling component simulates the scheduling of the pods based on the configuration of scaling groups. The configuration includes labels, taints, and instance specifications. If a scaling group can simulate the scheduling of the pods, this scaling group is selected for the scale-out activity. If more than one scaling groups meet the requirements, the system selects the scaling group that has the fewest idle resources after simulation.

3.1.6.13.2. Horizontal pod autoscaling

You can create an application that has Horizontal Pod Autoscaling (HPA) enabled in the Container Service console. HPA can automatically scale container resources for your application. You can also use a YAML file to describe HPA settings.

Create an application that has HPA enabled in the Container Service console

Container Service provided by Alibaba Cloud is integrated with HPA. You can create an application that has HPA enabled in the Container Service console. You can enable HPA when you create an application or after the application is created.

Enable HPA when you create an application

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click the name or click **Details** in the **Actions** column.

4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** tab, click **Create from Image**.
6. On the **Basic Information** wizard page, enter a name for your application, set other required parameters, and then click **Next**.

Parameter	Description
Name	Enter a name for the application.
Replicas	The number of pods that are provisioned for the application. Default value: 2.
Type	The type of the application. You can select **Deployments**, **StatefulSets**, **Jobs**, **Cron Jobs**, or **DaemonSets**.
Label	Add a label to the application. The label is used to identify the application.
Annotations	Add an annotation to the application.
Synchronize Timezone	Specify whether to synchronize the time zone between nodes and containers.

7. On the **Container** wizard page, set the container parameters, select an image, and then configure the required computing resources. Click **Next**. For more information, see Configure the containers.

   Note You must configure the required computing resources for the Deployment. Otherwise, you cannot enable HPA.

8. On the **Advanced** wizard page, find the **Access Control** section, click **Create** on the right side of Services, and then set the parameters. For more information, see Create an application from an image.
9. On the **Advanced** wizard page, select **Enable** for **HPA** and configure the scaling threshold and related settings.
   - **Metric**: Select CPU Usage or Memory Usage. The selected resource type must be the same as the one that you have specified in the Required Resources field.
   - **Condition**: Specify the resource usage threshold. HPA triggers scaling activities when the threshold is exceeded.
   - **Max. Replicas**: Specify the maximum number of pods to which the Deployment can be scaled.
   - **Min. Replicas**: Specify the minimum number of pods that must run for the Deployment.
10. In the lower-right corner of the Advanced wizard page, click **Create**. The application is created with HPA enabled.
    Verify the result
    i. Click **View Details** or choose **Workloads > Deployments**. On the page that appears, click the **name of the created application** or click **Details** in the **Actions** column. Then, click the **Horizontal Pod Autoscaler** tab to view information about the scaling group of the application.
    ii. After the application starts to run, container resources are automatically scaled based on the CPU utilization. You can also check whether HPA is enabled in the staging environment by performing a CPU stress test on the pods of the application. Verify that the pods are automatically scaled within 30 seconds.

Enable HPA after an application is created

This example describes how to enable HPA for a stateless application.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage, and click the name of the cluster or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, click the name of the application that you want to manage.
6. Click the **Pod Scaling** tab and click **Create**.
7. In the **Create** dialog box, configure the HPA settings. For more information about how to set the parameters, see HPA settings in Step 9.
8. Click **OK**.

Create an application that has HPA enabled by using kubectl

You can also create a Horizontal Pod Autoscaler by using an orchestration template and associate the Horizontal Pod Autoscaler with the Deployment for which you want to enable HPA. Then, you can run **kubectl** commands to enable HPA.

In the following example, HPA is enabled for an NGINX application.

1. Create a file named *nginx.yml* and copy the following content into the file.

   The following code block is a YAML template that is used to create a Deployment:

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx
  labels:
    app: nginx
spec:
  replicas: 2
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9 # replace it with your exactly <image_name:tags>
        ports:
        - containerPort: 80
        resources:
          requests:                         ##To enable HPA, you must set this parameter.
            cpu: 500m
```

2. Run the following command to create an NGINX application:

```
kubectl create -f nginx.yml
```

3. Create a Horizontal Pod Autoscaler.

   Use scaleTargetRef to associate the Horizontal Pod Autoscaler with the Deployment named **nginx**.

```
apiVersion: autoscaling/v2beta1
kind: HorizontalPodAutoscaler
metadata:
  name: nginx-hpa
  namespace: default
spec:
  scaleTargetRef:                              ##Associate the Horizontal Pod Autoscaler with the n
ginx Deployment.
    apiVersion: apps/v1
    kind: Deployment
    name: nginx
  minReplicas: 1
  maxReplicas: 10
  metrics:
  - type: Resource
    resource:
      name: cpu
      targetAverageUtilization: 50
```

Note You must configure the requested resources for the pods of the application. Otherwise, the Horizontal Pod Autoscaler cannot be started.

4. Run the `kubectl describe hpa name` command. The following output is an example of a warning that is returned:

```
Warning  FailedGetResourceMetric       2m (x6 over 4m)  horizontal-pod-autoscaler  missing request
for cpu on container nginx in pod default/nginx-deployment-basic-75675f5897-mqzs7
Warning  FailedComputeMetricsReplicas  2m (x6 over 4m)  horizontal-pod-autoscaler  failed to get c
pu utilization: missing request for cpu on container nginx in pod default/nginx-deployment-basic-7
5675f5
```

5. After the Horizontal Pod Autoscaler is created, run the `kubectl describe hpa name` command.

   If the following output is returned, it indicates that the Horizontal Pod Autoscaler is running as expected:

```
Normal SuccessfulRescale 39s horizontal-pod-autoscaler New size: 1; reason: All metrics below targ
et
```

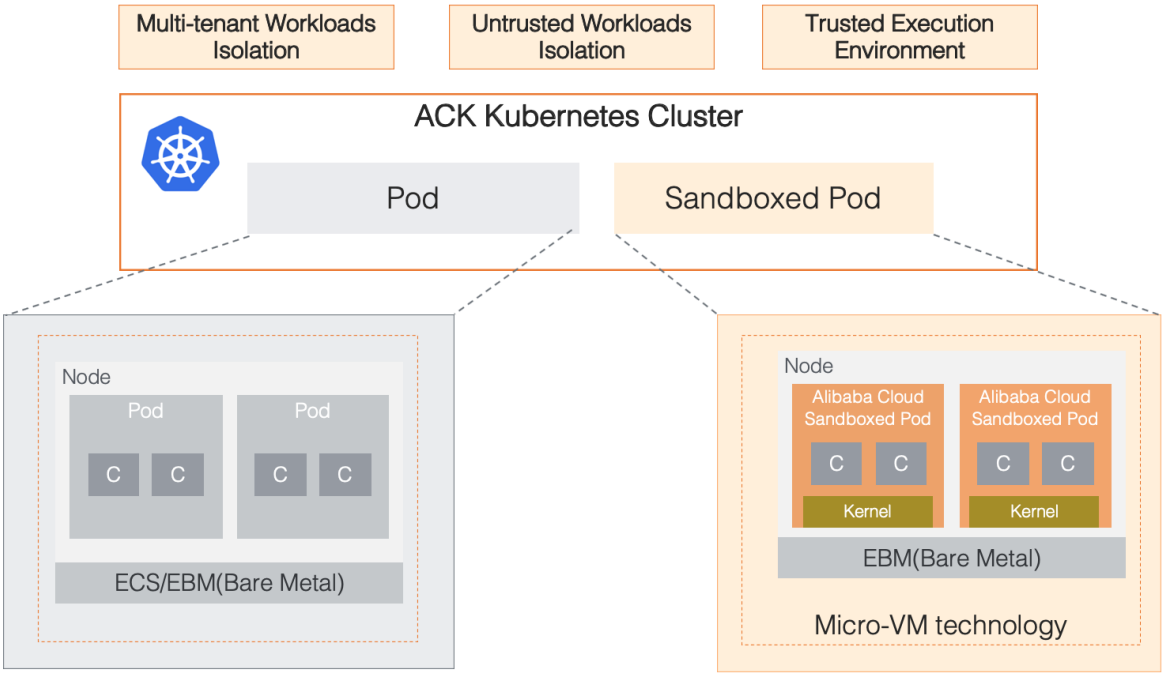
   If the CPU utilization of the NGINX application pod exceeds 50% as specified in the HPA settings, the Horizontal Pod Autoscaler automatically adds pods. If the CPU utilization of the NGINX application pod drops below 50%, the Horizontal Pod Autoscaler automatically removes pods.

3.1.6.14. Sandboxed-containers

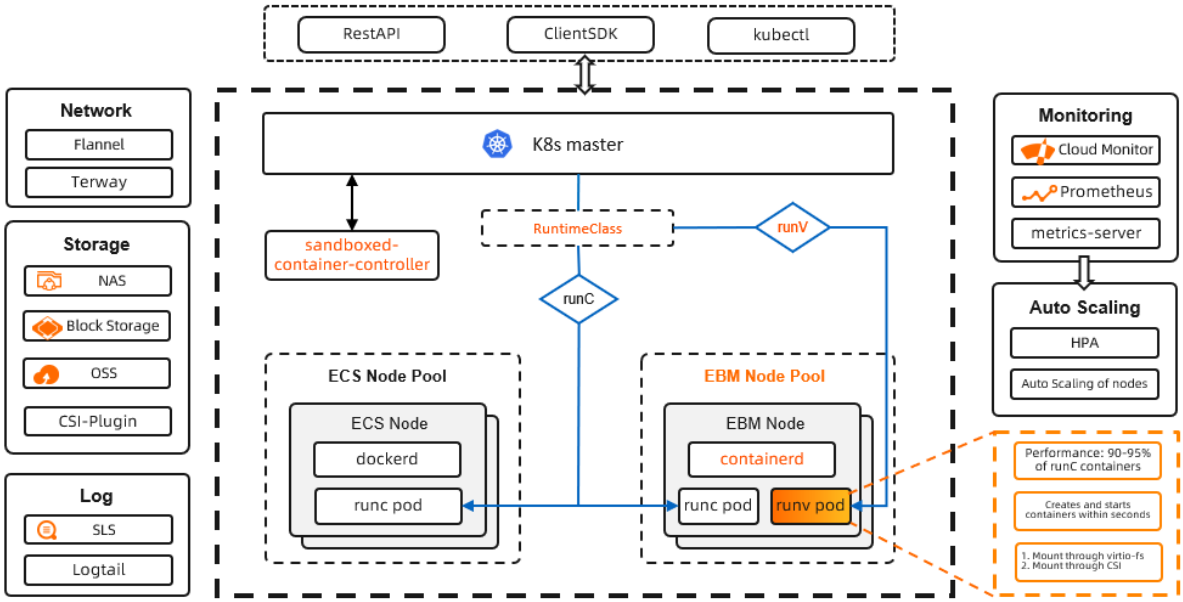
3.1.6.14.1. Overview

Sandboxed-Container is an alternative to the Docker runtime. Sandboxed-Container allows you to run applications in a sandboxed and lightweight virtual machine that has a dedicated kernel. This enhances resource isolation and improves security.

Sandboxed-Container is applicable to scenarios such as untrusted application isolation, fault isolation, performance isolation, and workload isolation among multiple users. Sandboxed-Container provides higher security. Sandboxed-Container has minor impacts on application performance and offers the same user experience as Docker in terms of logging, monitoring, and elastic scaling.



Architecture



Features

Sandboxed-Container is a container-securing runtime that is developed by Alibaba Cloud based on sandboxed and lightweight virtual machines. Compared with Sandboxed-Container V1, Sandboxed-Container V2 maintains the same isolation performance and reduces the pod overhead by 90%. It also allows you to start sandboxed containers 3 times faster and increases the maximum number of pods that can be deployed on a host by 10 times. Sandboxed-Container V2 provides the following key features:

- Strong isolation based on sandboxed and lightweight virtual machines.
- Good compatibility with runC in terms of application management.
- Network Attached Storage (NAS) file systems, disks, and Object Storage Service (OSS) buckets can be mounted both directly and through virtio-fs.

- The same user experience as runC in terms of logging, monitoring, and storage.
- Supports RuntimeClass (runC and runV). For more information, see RuntimeClass.
- Easy to use with minimum requirements on technical skills.
- Higher stability than Kata Containers. For more information about Kata Containers, see Kata Containers.

3.1.6.14.2. Create a Kubernetes cluster that runs sandboxed containers

This topic describes how to create a Kubernetes cluster that runs sandboxed containers in the Container Service console.

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**. On the Clusters page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Cluster** page, set basic configurations for the cluster.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the Kubernetes cluster.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ○ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ○ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Kubernetes Version	Select a Kubernetes version.
Container Runtime	Select a runtime for the Kubernetes cluster.
Billing Method	Only pay-as-you-go nodes are supported.

Parameter	Description
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add up to three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	By default, **Create Instance** is selected.
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ◦ Instance Type: Select Elastic Compute Service (ECS) bare metal instance types. ◦ Selected Types: The selected instance types are displayed. ◦ Quantity: Set the number of worker nodes. ◦ System Disk: Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data. ◦ Mount Data Disk: Standard SSDs and ultra disks are supported. **Note** You can enable disk encryption and data backup when you mount disks. The disks are used to store the root file systems of containers on the nodes. Therefore, you must mount a disk of at least 200 GiB. We recommend that you mount a disk of at least 1 TiB.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Network Plug-in	Flannel and Terway are supported. By default, Flannel is selected.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC.

Parameter	Description
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. ◦ If you select this check box, an EIP is created and attached to an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig from within the VPC.
Ingress	Specify whether to install Ingress controllers. By default, **Install Ingress Controller** is selected.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards.
Volume Plug-in	By default, CSI is selected.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
RDS Whitelist	Add the IP addresses of the nodes to the whitelist of the ApsaraDB RDS instance that is allowed to access the Kubernetes cluster. **Note** To enable an ApsaraDB RDS instance to access the Kubernetes cluster, you must deploy the ApsaraDB RDS instance in the same VPC as the Kubernetes cluster.
Node Protection	This check box is selected by default to prevent nodes from being deleted in the console or by calling API operations.
Label	Add labels to the cluster.

4. Complete the advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that is assigned to a node.
Kube-proxy Mode	iptables and IPVS are supported. ◦ iptables is a mature and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is restricted by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ◦ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.

Parameter	Description
Custom Node Name	Specify whether to use a custom node name.
Node Port Range	Specify the node port range.
Taints	Add taints to all worker nodes in the Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	You can customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run user data scripts during instance startup. ○ Import user data as common data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, click **OK** to start the deployment.

Result

After the cluster is created, you can find the cluster on the **Clusters** page in the Container Service console.

3.1.6.14.3. Expand a Container Service cluster that runs sandboxed containers

This topic describes how to scale out the worker nodes in a Container Service cluster that runs sandboxed containers in the Container Service console.

Prerequisites

You cannot scale out the master nodes in a Container Service cluster that runs sandboxed containers.

To expand a Container Service cluster that runs sandboxed containers, you must set the parameters as required in the following table. Otherwise, the added nodes cannot run sandboxed containers.

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Expand** in the **Actions** column.
4. Go to the Expand page and set the required parameters.

   In this example, the number of worker nodes in the Container Service cluster is increased from three to five. The following table describes the required parameters.

Parameter	Description
Cluster Name	By default, the name of the Container Service cluster appears.
Region	The region where the Container Service cluster is deployed.
Container Runtime	By default, Sandboxed-Container appears.
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ○ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ○ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disallow the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different zones.
Billing Method	Only pay-as-you-go nodes are supported.
Existing Worker Nodes	The number of existing workers in the Container Service cluster.
Nodes to Add	Set the number of worker nodes to add.
Worker Nodes After Scaling	The number of worker nodes after the scaling.
Instance Type	Select ECS Bare Metal Instance.
Selected Types	The selected instance types are displayed.
System Disk	Standard SSDs and ultra disks are supported. **Note** You can select **Enable Backup** to back up disk data.
Mount Data Disk	Standard SSDs and ultra disks are supported. **Note** You can enable disk encryption and data backup when you mount disks. The disks are used to store the root file systems of containers on the nodes. Therefore, you must mount a disk of at least 200 GiB. We recommend that you mount a disk of at least 1 TiB.
Password	○ **Password**: Enter the password that is used to log on to the nodes. ○ **Confirm Password**: Enter the password again.
RDS Whitelist	Set the Apsara RDS whitelist. Add the IP addresses of the nodes in the cluster to the RDS whitelist.
Label	Add labels to the cluster.

Parameter	Description
Taints	Add taints to all worker nodes in the Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ○ None: indicates that the default CPU affinity is used. This is the default policy. ○ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
User Data	You can customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ○ Run user data scripts during instance startup. ○ Import user data as common data to an ECS instance for future reference.

5. Click **Submit**.

What's next

After the Container Service cluster is expanded, go to the details page of the Container Service cluster. In the left-side navigation pane, choose **Clusters > Node Pools**. You can find that the number of worker nodes is increased from 3 to 5.

3.1.6.14.4. Create an application that runs in sandboxed containers

This topic describes how to use an image to create an NGINX application that runs in sandboxed containers. The NGINX application is accessible over the Internet.

Prerequisites

A cluster that contains sandboxed containers is created. For more information, see Create a Kubernetes cluster that supports sandboxed containers.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Workloads > Deployments**.
5. On the **Deployments** page, select the namespace and click **Create from Image** in the upper-right corner.
6. On the **Basic Information** wizard page, specify the basic information of the application and click **Next**.

   Set **Container Runtime** to **runv**. Set the following parameters: **Name**, **Replicas**, **Type**, **Label**, and **Annotations**. Select whether you want to enable **Synchronize Timezone**. The number of replicas specifies the number of pods that are provisioned for in the application.

   > **Note**
   >
   > **Deployments** is selected in this example.

7. Configure containers.

> **Note** In the upper part of the **Container** wizard page, click **Add Container** to add more containers for the application.

The following table describes the parameters that are required to configure the containers.

- General settings

Parameter	Description
Image Name	Click **Select Image**. In the dialog box that appears, select an image and click **OK**. In this example, an NGINX image is selected. You can also enter the address of an image stored in a private registry. The image address must be in the following format: `domainname/namespace/imagename:tag`.
Image Version	■ Click **Select Image Version** and select an image version. If you do not specify an image version, the latest image version is used. ■ You can select the following image pulling policies: ■ **ifNotPresent**: If the image that you want to pull is found in the region where the cluster is deployed, Container Service uses the local image. Otherwise, Container Service pulls the image from the corresponding repository. ■ **Always**: Container Service pulls the image from the repository each time the application is deployed or expanded. ■ **Never**: Container Service uses only images on your on-premise machine. **Note** If you select **Image Pull Policy**, no image pulling policy is applied. ■ To pull the image without a Secret, click **Set Image Pull Secret** to set a Secret for pulling images.
Resource Limit	You can specify an upper limit for the CPU, memory, and ephemeral storage space that the container can consume. This prevents the container from occupying an excessive amount of resources. The CPU resource is measured in milicores (one thousandth of one core). The memory resource is measured in MiB. The ephemeral storage resource is measured in GiB.
Required Resources	The amount of CPU and memory resources that are reserved for this application. These resources are exclusive to the container. This prevents the application from becoming unavailable if other services or processes compete for computing resources.
Container Start Parameter	■ stdin: Pass stdin to the container. ■ tty: Stdin is a TeleTYpewriter (TTY).
Privileged Container	■ If you select Privileged Container, privileged=true is set for the container and the privilege mode is enabled. ■ If you do not select Privileged Container, privileged=false is set for the container and the privilege mode is disabled.
Init Container	If you select Init Container, an init container is created. An init container provides tools to manage pods. For more information, see Init Containers.

- (Optional)Ports

  Configure container ports.

  - Name: Enter a name for the port.
  - Container Port: Enter the container port that you want to open. Enter a port number from 1 to 65535.
  - Protocol: Select TCP or UDP.

- (Optional)Environments

  You can configure environment variables for pods in key-value pairs. Environment variables are used to apply pod configurations to containers. For more information, see Pod variables.

  - Type: Select the type of the environment variable. You can select **Custom**, **ConfigMaps**, **Secrets**, **Value/ValueFrom**, or **ResourceFieldRef**. If you select ConfigMaps or Secret as the type of the environment variable, all values in the selected ConfigMap or Secret are passed to the container environment variables. In this example, Secret is selected.

    Select **Secrets** from the Type drop-down list and select a Secret from the **Value/ValueFrom** drop-down list. All values in the selected Secret are passed to the environment variable.

    
    In this case, the YAML file that is used to deploy the application contains the settings that reference all data in the selected Secret.

    ```
    envFrom:
      - secretRef:
          name: test
    ```

  - Variable Key: Specify the name of the environment variable.
  - Value/ValueFrom: Specify the value that is referenced by the environment variable.

- (Optional)Health Check

  Health check settings include liveness and readiness probes. Liveness probes determine when to restart the container. Readiness probes determine whether the container is ready to accept network traffic. For more information about health checks, see Configure Liveness, Readiness, and Startup Probes.

Request type	Description

Request type	Description
HTTP	Sends an HTTP GET request to the container. You can configure the following parameters: ■ Protocol: HTTP or HTTPS. ■ Path: the requested path on the server. ■ Port: Enter the container port that you want to open. Enter a port number from 1 to 65535. ■ HTTP Header: Enter the custom headers in the HTTP request. Duplicate headers are allowed. Key-value pairs are supported. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 3. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.
TCP	Sends a TCP socket to the container. kubelet attempts to open the socket on the specified port. If the connection can be established, the container is considered healthy. Otherwise, the container is considered unhealthy. You can set the following parameters: ■ Port: Enter the container port that you want to open. Enter a port number from 1 to 65535. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 15. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the time interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

Request type	Description
Command	Runs a probe command in the container to check the health status of the container. You can set the following parameters: ■ Command: the probe command that is run to check the health status of the container. ■ Initial Delay (s): the initialDelaySeconds field in the YAML file. This field specifies the time (in seconds) that the system must wait before it can send a probe to the container after the container is started. Default value: 5. ■ Period (s): the periodSeconds field in the YAML file. This field specifies the interval (in seconds) at which probes are performed. Default value: 10. Minimum value: 1. ■ Timeout (s): the timeoutSeconds field in the YAML file. This field specifies the time (in seconds) after which a probe times out. Default value: 1. Minimum value: 1. ■ Healthy Threshold: the minimum number of times that an unhealthy container must consecutively pass health checks before it is considered healthy. Default value: 1. Minimum value: 1. For liveness probes, this parameter must be set to 1. ■ Unhealthy Threshold: the minimum number of times that a healthy container must consecutively fail health checks before it is considered unhealthy. Default value: 3. Minimum value: 1.

- Lifecycle

  You can set the following parameters to configure the lifecycle of the container: Start, Post Start, and Pre Stop. For more information, see Configure the lifecycle of a container.

  - **Start**: Set the command and parameter that take effect before the container starts.
  - **Post Start**: Set the command that takes effect after the container starts.
  - **Pre Stop**: Set the command that takes effect before the container stops.

- (Optional)Volume

  You can mount local volumes and persistent volume claims (PVCs) to the container.

  - **Add Local Storage**: You can select HostPath, ConfigMap, Secret, and EmptyDir. The source directory or file is mounted to a path in the container. For more information, see Volumes.
  - **Add PVC**: Cloud Storage is supported.

  In this example, a PVC named disk-ssd is mounted to the */tmp* path of the container.

- (Optional)Log

  Configure **Log Service**. You can specify log collection configurations and add custom tags.

  > **Notice** Make sure that the Log Service agent is installed in the cluster.

Parameter	Description
	Logstore: creates a Logstore in Log Service to store collected log data.

Parameter Collection Configuration	Description
	Log Path in Container: specifies stdout or a path to collect log data ■ stdout: specifies that the stdout files are collected. ■ Text Logs: specifies that log data in the specified path of the container is collected. In this example, */var/log/nginx* is specified as the path. Wildcard characters can be used to specify the path.
Custom Tag	You can also add custom tags. Custom tags are added to the log data of the container when the log data is collected. Log data with tags is easier to aggregate and filter.

8. Configure the parameters based on your business requirements and click **Next**.
9. (Optional)Configure advanced settings.
   - Access Control

> **Note**
>
> You can configure the following access control settings based on your business requirements:
>
> - Internal applications: For applications that run inside the cluster, you can create a ClusterIP or NodePort Service to enable internal communication.
> - External applications: For applications that are open to the Internet, you can configure access control by using one of the following methods:
>   - Create a LoadBalancer Service and enable access to your application over the Internet by using a Server Load Balancer (SLB) instance.
>   - Create an Ingress and use the Ingress to expose your application to the Internet. For more information, see Ingress.

You can also specify how the backend pods are exposed to the Internet. In this example, a ClusterIP Service and an Ingress are created to expose the NGINX application to the Internet.

Parameter	Description
Services	Click **Create** on the right side of **Services**. In the Create Service dialog box, set the parameters. Select **Cluster IP**.
Ingresses	Click **Create** on the right side of **Ingresses**. In the Create dialog box, set the parameters. **Note** When you create an application from an image, you can create an Ingress only for one Service. In this example, a virtual hostname is used as the test domain name. You must add the following entry to the hosts file to map the domain name to the IP address of the Ingress. In actual scenarios, use a domain name that has obtained an Internet Content Provider (ICP) number. `101.37.22*.***  foo.bar.com  #The IP address of the Ingress.`

You can find the created Service and Ingress in the **Access Control** section. You can click **Update** or **Delete** to change the configurations.

- Scaling

  Specify whether to enable **HPA** to automatically scale the number of pods based on the CPU and memory usage. This enables the application to run smoothly at different load levels.

  > **Note** To enable HPA, you must configure required resources for the container. Otherwise, HPA does not take effect.

  - **Metric**: Select CPU Usage or Memory Usage. The selected resource type must be the same as the one you have specified in the Required Resources field.
  - **Condition**: Specify the resource usage threshold. HPA triggers scaling events when the threshold is exceeded.
  - **Max. Replicas**: Specify the maximum number of replicated pods to which the application can be scaled.
  - **Min. Replicas**: Specify the minimum number of replicated pods that must run.

- Scheduling

  You can set the following parameters: Update Method, Node Affinity, Pod Affinity, Pod Anti Affinity, and Toleration. For more information, see Affinity and anti-affinity.

  > **Note** Node affinity and pod affinity affect pod scheduling based on node labels and pod labels. You can add node labels and pod labels that are provided by Kubernetes to configure node affinity and pod affinity. You can also add custom labels to nodes and pods, and then configure node affinity and pod affinity based on these custom labels.

Parameter	Description
Update Method	Select Rolling Update or OnDelete. For more information, see Deployments.
Node Affinity	Set **Node Affinity** by adding labels to worker nodes. Node Affinity supports required and preferred rules, and various operators, such as In, NotIn, Exists, DoesNotExist, Gt, and Lt. ■ **Required**: Specify the rules that must be matched for pod scheduling. In the YAML file, these rules are defined by the requiredDuringSchedulingIgnoredDuringExecution field of the nodeAffinity parameter. These rules have the same effect as the `Node Selector` parameter. In this example, pods can be scheduled only to nodes with the specified labels. You can create multiple required rules. However, only one of them must be met. ■ **Preferred**: Specify the rules that are not required to be matched for pod scheduling. Pods are scheduled to a node that matches the preferred rules when multiple nodes match the required rules. In the YAML file, these rules are defined by the preferredDuringSchedulingIgnoredDuringExecution field of the nodeAffinity parameter. In this example, the scheduler attempts to schedule a pod to a node that matches the preferred rules. You can also set weights for preferred rules. If multiple nodes match the rule, the node with the highest weight is preferred. You can create multiple preferred rules. However, all of them must be met before the pod can be scheduled.

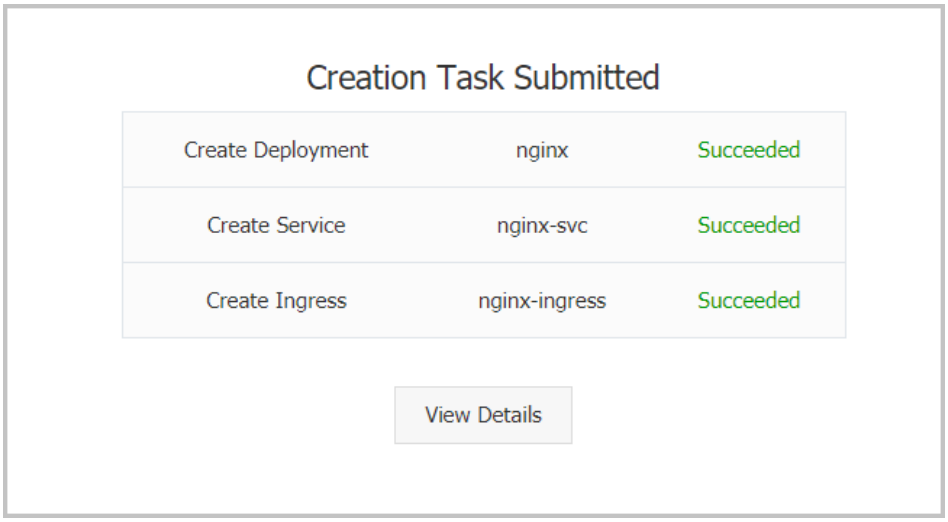
Parameter	Description
Pod Affinity	Pod affinity rules specify how pods are deployed relative to other pods in the same topology domain. For example, you can use pod affinity to deploy services that communicate with each other to the same topological domain, such as a host. This reduces the network latency between these services. Pod affinity enables you to select nodes to which pods can be scheduled based on the labels of other running pods. Pod affinity supports required and preferred rules, and the following operators: `In`, `NotIn`, `Exists`, and `DoesNotExist`. ■ **Required**: Specify rules that must be matched for pod scheduling. In the YAML file, these rules are defined by the requiredDuringSchedulingIgnoredDuringExecution field of the podAffinity parameter. A node must match the required rules before pods can be scheduled to the node. ■ **Namespace**: Specify the namespace to apply the required rule. Pod affinity rules are defined based on the labels that are added to pods and therefore must be scoped to a namespace. ■ **Topological Domain**: Set the topologyKey. This specifies the key for the node label that the system uses to denote the topological domain. For example, if you set the parameter to `kubernetes.io/hostname`, topologies are determined by nodes. If you set the parameter to `beta.kubernetes.io/os`, topologies are determined by the operating systems of nodes. ■ **Selector**: Click Add to add pod labels. ■ **View Applications**: Click **View Applications** and set the namespace and application in the dialog box that appears. You can view the pod labels on the selected application and add the labels as selectors. ■ Required Rules: Specify labels on existing applications, the operator, and the label value. In this example, the required rule specifies that the application to be created is scheduled to a host that runs applications with the `app:nginx` label. ■ **Preferred**: Specify rules that are not required to be matched for pod scheduling. In the YAML file, preferred rules are defined by the preferredDuringSchedulingIgnoredDuringExecution field of the podAffinity parameter. The scheduler attempts to schedule the pod to a node that matches the preferred rules. You can set weights for preferred rules. The other parameters are the same as those of required rules. **Note** **Weight**: Set the weight of a preferred rule to a value from 1 to 100. The scheduler calculates the weight of each node that meets the preferred rule based on an algorithm, and then schedules the pod to the node with the highest weight.

Parameter	Description
Pod Anti Affinity	Pod anti-affinity rules specify that pods are not scheduled to topological domains where pods with matching labels are deployed. Pod anti-affinity rules apply to the following scenarios: ■ Schedule the pods of an application to different topological domains, such as multiple hosts. This allows you to enhance the stability of the service. ■ Grant a pod exclusive access to a node. This enables resource isolation and ensures that no other pod can share the resources of the specified node. ■ Schedule pods of an application to different hosts if the pods may interfere with each other. **Note** The parameters of pod anti-affinity rules are the same as those of pod affinity rules. You can create the rules for different scenarios.
Toleration	Configure toleration rules to allow pods to be scheduled to nodes with matching taints.
Schedule to Virtual Nodes	Specify whether to schedule pods to virtual nodes. This option is unavailable if the cluster does not contain a virtual node.

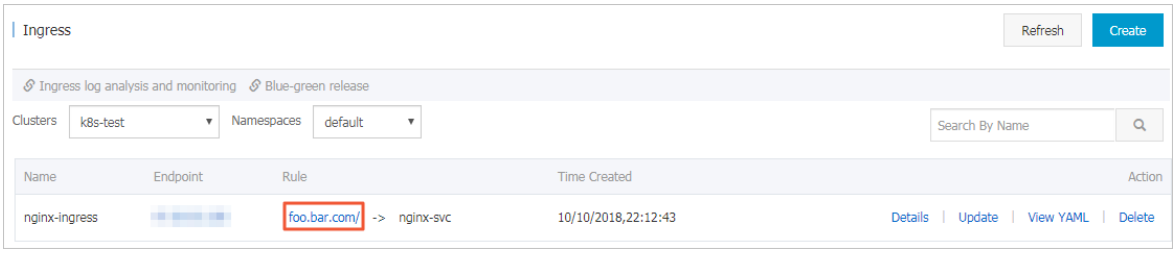
- Labels and Annotations
  - Pod Labels: Add a label to the pod. The label is used to identify the application.
  - Pod Annotations: Add an annotation to the pod.

10. Click **Create**.

    After the application is deployed, you are redirected to the Complete wizard page. The resource objects of the application are displayed. You can find the resource objects under the application and click **View Details** to view application details.



11. In the left-side navigation pane, choose **Ingresses and Load Balancing > Ingresses**.
    The created Ingress rule is displayed on the page.



Result

Enter the test domain in the address bar of your browser and press Enter. The NGINX welcome page appears.

3.1.6.14.5. Configure a Kubernetes cluster that runs both sandboxed and Docker containers

Node pools support multiple types of container runtime. However, nodes in the same node pool must use the same type of container runtime. Container Service allows you to create node pools of different container runtime types for a cluster. This topic describes how to create a node pool that runs sandboxed containers and a node pool that runs Docker containers for a Kubernetes cluster.

Prerequisites

A Kubernetes cluster is created. For more information, see Create a Kubernetes cluster.

> **Notice** The Kubernetes cluster must meet the following requirements:
>
> - The cluster version must be 1.14.6-aliyun.1 or later.
> - The network plug-in must be Flannel or Terway. Terway must run in One ENI for Multi-Pod mode.
> - The volume plug-in must be CSI-Plugin 1.14.8.39-0d749258-aliyun or later. Flexvolume is not supported.
> - The logtail-ds version must be 0.16.34.2-f6647154-aliyun or later.

Considerations

- By default, a cluster can contain at most 100 nodes.
- Before you add an existing Elastic Compute Service (ECS) instance that is deployed in a virtual private cloud (VPC), make sure that an elastic IP address (EIP) is associated with the ECS instance, or a NAT gateway is created in the VPC. In addition, the nodes that you want to add to the node pool must have access to the Internet. Otherwise, the ECS instance cannot be added.

Create a node pool that runs Docker containers

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.

4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool** and set the parameters.

   For more information, see Create a Kubernetes cluster. The following table describes the parameters.

Parameter	Description
Name	Enter a name for the node pool.
Container Runtime	Select Docker. This specifies that all containers in the node pool are Docker containers.
Quantity	Specify the initial number of nodes in the node pool. If you do not need to create nodes, set this parameter to 0.
Operating System	The CentOS and Aliyun Linux operating systems are supported.
ECS Label	You can add labels to the ECS instances.
Node Label	You can add labels to the nodes in the cluster.
Custom Resource Group	Specify the resource group of the nodes to be added to the node pool.
Custom Security Group	Select a custom security group.

6. Click **OK**.

Create a node pool that runs sandboxed containers

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Node Pool** and set the parameters.

   For more information, see Create a Kubernetes cluster. The following table describes the parameters.

Parameter	Description
Name	Enter a name for the node pool.
Container Runtime	Select Sandboxed-Container. This specifies that all containers in the node pool are sandboxed containers.
Quantity	Specify the initial number of nodes in the node pool. If you do not need to create nodes, set this parameter to 0.
Operating System	Select an operating system. Sandboxed containers support only the Aliyun Linux operating system.
Mount Data Disk	You must mount a disk of at least 200 GiB.
ECS Label	You can add labels to the ECS instances.
Node Label	You can add labels to the nodes in the cluster.

Parameter	Description
Custom Resource Group	Specify the resource group of the nodes to be added to the node pool.
Custom Security Group	Select a custom security group.

6. Click **OK**.

Result

- After you perform the preceding steps, check the states of the node pools on the **Node Pools** page. If the node pools are in the **Activate** state, the node pools are created.
- You can connect to the Kubernetes cluster and view detailed information about the nodes in the node pools.
  i. On the **Node Pools** page, select a node pool that you have created and click its name. In the **Node Pool Information** section, find and record the **Node Pool ID**.

  ii. Connect to the Kubernetes cluster by using kubectl. For more information, see Connect to a cluster through kubectl.
  iii. Run the following command to query the names of the nodes in a specified node pool:

```
kubectl get node --show-labels | grep -E "${node pool ID}|${node pool ID}"
```

  iv. Run the following command to query detailed information about a specified node:

```
kubectl get node -o wide | grep -E "${node name} {node name}"
```

3.1.6.14.6. How do I select between Docker and Sandboxed-Container?

Containers and images have become the industry standards for software packaging and delivery. Kubernetes has become a standard platform for building, developing, and managing containerized cloud-native applications. An increasing number of enterprises and customers choose to deploy their applications in Container Service. Container Service supports two types of runtime: Docker and Sandboxed-Container. This topic describes the differences between these runtimes in the following aspects: implementations and limits, commonly used commands provided by Docker Engine and Containerd, and deployment architectures. This provides references for you to select between Docker and Sandboxed-Container based on your requirements.

Differences between Docker and Sandboxed-Container in terms of implementations and limits

Item	Docker	Sandboxed-Container V2	Description
Cluster type	All types	All types	N/A

Item	Docker	Sandboxed-Container V2	Description
Node type	• ECS • EBM	EBM	N/A
Node operating system	• CentOS • Alibaba Cloud Linux2	Alibaba Cloud Linux2	• You cannot deploy both Docker and Sandboxed-Container on the same node. • To deploy both Docker and Sandboxed-Container in a cluster, you can create node pools of different runtime types.
Container engine	Docker	Containerd	N/A
Monitoring	Supported	Supported	N/A
Container log collection	Supported	Sidecar: supported. Manual configuration is required.	N/A
Container stdout collection	Supported	Supported	N/A
RuntimeClass	Not supported	Supported (runV)	N/A
Pod scheduling	No configuration is required.	• For Kubernetes V1.14.x, you must add the following configuration to the nodeSelector field: `alibabacloud.com/sandboxed-container: Sandboxed-Container.runv` • For Kubernetes V1.16.x and later, no configuration is required.	N/A
HostNetwork	Supported	Not supported	N/A
exec/logs	Supported	Supported	N/A
Node data disk	N/A	Required. The data disk must be at least 200 GiB.	N/A
Network plug-in	• Flannel • Terway	• Flannel • Terway: supports only the One ENI for Multi-Pod mode.	N/A
Kube-proxy mode	• Iptables • IPVS	• Iptables • IPVS	N/A

Item	Docker	Sandboxed-Container V2	Description
Volume plug-in	CSI Plugin	CSI Plugin	N/A
Container root file system	OverlayFS	VirtioFS	N/A

Differences in the commonly used commands provided by Docker Engine and Containerd

Docker uses Docker Engine for container lifecycle management. Sandboxed-Container uses Containerd for container lifecycle management. These tools support different commands that can be used to manage images and containers. The following table lists the commonly used commands.

Command	Docker	Containerd	
	docker	crictl (recommended)	ctr
Queries containers	docker ps	crictl ps	ctr -n k8s.io c ls
Queries container details	docker inspect	crictl inspect	ctr -n k8s.io c info
Queries container logs	docker logs	crictl logs	N/A
Runs a command in a container	docker exec	crictl exec	N/A
Mounts local standard input, output, and error streams to a running container	docker attach	crictl attach	N/A
Queries resource usage statistics	docker stats	crictl stats	N/A
Creates a container	docker create	crictl create	ctr -n k8s.io c create
Starts one or more containers	docker start	crictl start	ctr -n k8s.io run
Stops one or more containers	docker stop	crictl stop	N/A
Removes one or more containers	docker rm	crictl rm	ctr -n k8s.io c del
Queries images	docker images	crictl images	ctr -n k8s.io i ls
Queries image details	docker inspect	crictl inspecti	N/A
Pulls an image	docker pull	crictl pull	ctr -n k8s.io i pull
Pushes an image	docker push	N/A	ctr -n k8s.io i push
Removes one or more images	docker rmi	crictl rmi	ctr -n k8s.io i rm
Queries pods	N/A	crictl pods	N/A
Queries pod details	N/A	crictl inspectp	N/A

Command	Docker	Containerd	
	docker	crictl (recommended)	ctr
Starts one or more pods	N/A	crictl runp	N/A
Stops one or more pods	N/A	crictl stopp	N/A

Differences between Docker and Sandboxed-Container in terms of deployment architectures

Runtime	Deployment architecture
Docker	`kubelet -> dockerd -> containerd -> containerd-shim -> runC containers`

Sandboxed-Container V1	`kubelet -> (CRI) containerd`
	`\-> containerd-shim -> runC containers`
	`\-> containerd-shim-kata-v2 -> runV sandboxed containers`

Sandboxed-Container V2	`kubelet -> (CRI) containerd`
	`\-> containerd-shim -> runC containers`
	`\-> containerd-shim-rund-v2 -> runV sandboxed containers`

3.1.6.14.7. Benefits of Sandboxed-Container

This topic describes the advantages and application scenarios of Sandboxed-Container and provides a comparison between Sandboxed-Container and open source Kata Containers. This allows you to learn more about the benefits of Sandboxed-Container.

Context

Sandboxed-Container provides an alternative to the Docker runtime environment. It supports the following features:

- Sandboxed-Container allows your applications to run in a sandboxed and lightweight virtual machine. This virtual machine is equipped with a dedicated kernel and provides better isolation and enhanced security.
- Compared with open source Kata Containers, Sandboxed-Container is optimized for storage, networking, and stability.
- You can use Sandboxed-Container to isolate untrusted applications and applications of different tenants for higher security. You can also use Sandboxed-Container to isolate applications with faults and applications with degraded performance. This minimizes the negative impact on your service. In addition, Sandboxed-Container offers the same user experience as Docker in terms of logging, monitoring, and elastic scaling.

Benefits

Compared with Docker, Sandboxed-Container has the following benefits:

- Strong isolation based on sandboxed and lightweight virtual machines.
- Compatibility with runC in terms of application management.

- High performance that corresponds to 90% performance of applications based on runC.
- The same user experience as runC in terms of logging, monitoring, and storage.
- Support for RuntimeClass.
- Easy to use with limited expertise that is required to use virtual machines.
- Higher stability than that provided by Kata Containers.

Comparison between Sandboxed-Container and Kata Containers

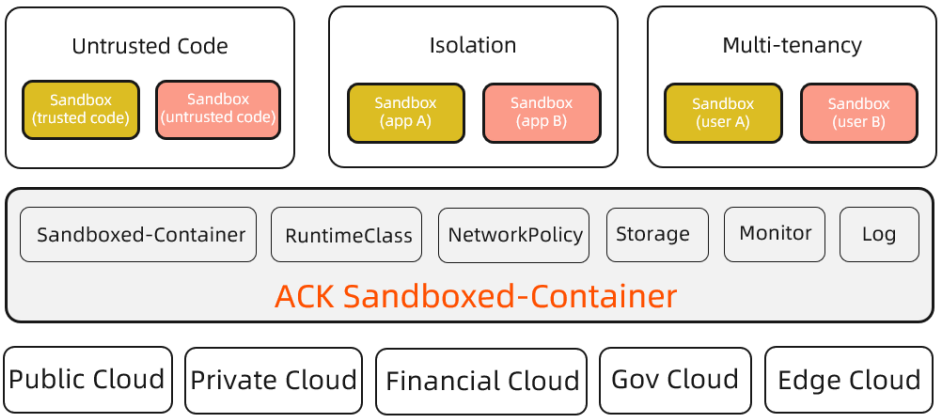
Sandboxed-Container outperforms Kata Containers in the following aspects.

Item	Category	Sandboxed-Container	Kata Containers
Sandbox startup time consumption		About 150 ms	About 500 ms
Root file system		OverlayFS over virtio-fs. Performance: ☆☆☆☆	OverlayFS over 9pfs. Performance: ☆☆
Volume	HostPath	Disks are mounted to Sandboxed-Container over 9pfs. Performance: ☆☆	Disks are mounted to Kata Containers over 9pfs. Performance: ☆☆
	EmptyDir	over VirtioFS	By default, the volume is mounted to Kata Containers over 9pfs.
	Disk	By default, cloud disks are mounted to Sandboxed-Container over virtio-fs. Performance: ☆☆☆☆	Cloud disks are mounted to Kata Containers over 9pfs. Performance: ☆☆
	NAS	By default, Apsara File Storage NAS (NAS) file systems are mounted to Sandboxed-Container over virtio-fs. Performance: ☆☆☆☆	NAS file systems are mounted to Kata Containers over 9pfs. Performance: ☆
Network plug-in		• The Terway network plug-in is used. Its network performance is 20% to 30% higher than Flannel. Terway supports features such as NetworkPolicy. This allows you to define the networking policies for pods. • Flannel	Flannel

Item	Category	Sandboxed-Container	Kata Containers
Monitoring and alerting		• Enhanced monitoring of disks and network conditions for pods that host Sandboxed-Container. • Integrated with Cloud Monitor. This facilitates cluster monitoring and alerting.	Monitoring of disks and network conditions is unavailable for pods that host Sandboxed-Container.
Stability		☆☆☆☆☆	☆☆

Applicable scenarios of Sandboxed-Container

This section describes the applicable scenarios of Sandboxed-Container.



- Scenario 1: Sandboxed-Container can run untrusted code and applications in isolated containers. This is not supported by containers in runC.

- Security risks of runC

  - runC isolates containers by using namespaces and control groups (cgroups). This exposes containers to security threats.
  - All containers on a node share the host kernel. If a kernel vulnerability is exposed, malicious code may escape to the host and then infiltrate the backend network. Malicious code execution may cause privilege escalation, compromise sensitive data, and destroy system services and other applications.
  - Attackers may also exploit application vulnerabilities to infiltrate the internal network.

  You can implement the following measures to reduce security risks of containers in runC.

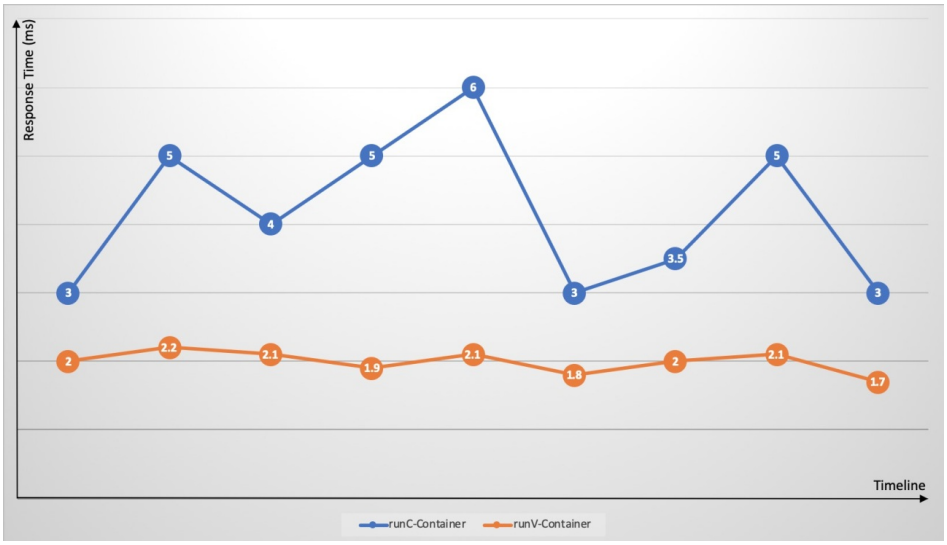
  - Seccomp: filters system calls.
  - SElinux: restricts the permissions of container processes, files, and users.
  - Capability: limits the capability of container processes.
  - dockerd rootless mode: forbids users to use root permissions to run the Docker daemon and containers.

  The preceding measures can enhance the security of containers in runC and reduce attacks on the host kernel by malicious containers. However, container escapes and host kernel vulnerabilities remain unresolved.

- Sandboxed-Container prevents potential risks based on container isolation

  In a Sandboxed-Container runtime environment, applications that have potential security risks are deployed on sandboxed and lightweight virtual machines. Each of the virtual machines has a dedicated guest OS kernel. If a security vulnerability is detected on a guest OS kernel, the attack is limited to one sandbox and does not affect the host kernel or other containers. The Terway network plug-in allows you to define networking policies for pods. This enables system isolation, data isolation, and network isolation for Sandboxed-Containers.

- Scenario 2: Sandboxed-Container resolves common issues of runC containers, such as fault spreading, resource contention, and performance interference.

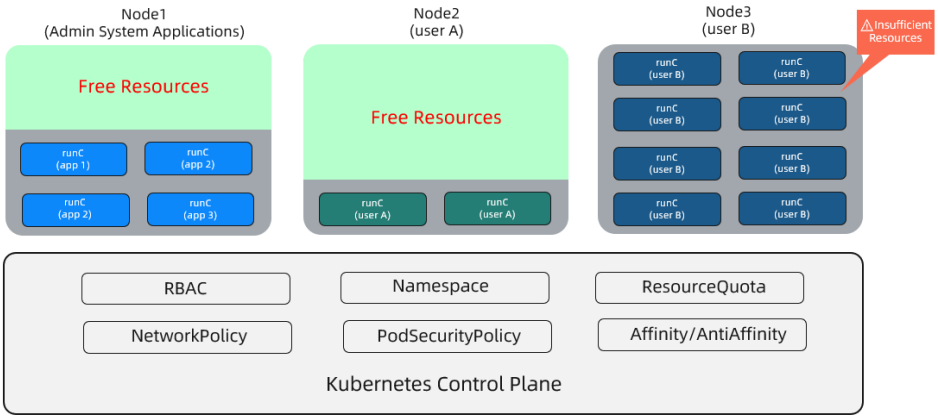


Kubernetes provides easy deployment of different containers on a single node. However, cgroups are not optimized to address resource contention. Resource-intensive applications (such as CPU-intensive, I/O-intensive applications) may compete for the same resources. This causes significant fluctuations in response time and increases the overall response time. Exceptions or faults on an application may spread to the hosting node and disrupt the running of the total cluster. For example, memory leaks and frequent core dumps of an application may overload the node, and exceptions on a container may trigger a host kernel bug that results in complete system failure. Sandboxed-Container addresses the issues that are common with runC containers by using dedicated guest OS kernels and hypervisors. The issues include failure spreading, resource contention, and performance interference.

- Scenario 3: Sandboxed-Container supports multi-tenant services.

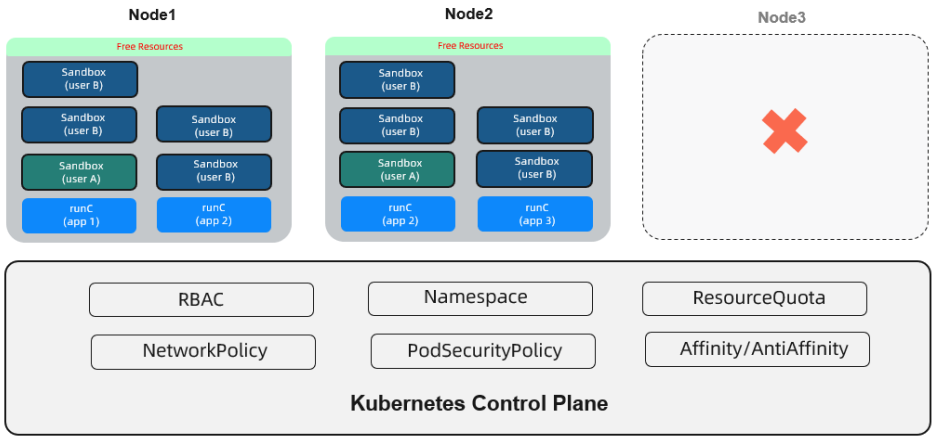
  You may need to isolate the applications of an enterprise that consists of multiple business lines or departments. For example, a financial department requires high security applications. However, other non-security-sensitive applications do not have high security requirements. Containers in runC fail to eliminate the potential risks that arise in untrusted applications. In this scenario, you can implement the following counter measures:

  - Deploy multiple independent single-tenant clusters. For example, deploy financial business and other non-security-sensitive business in different clusters.
  - Deploy a multi-tenant cluster and separate applications of different business lines by namespaces. The resource of a node is exclusive to a single business line. This solution provides data isolation for coordination with the resource quotas and network policies to implement multi-tenant isolation. Compared with multiple single-tenant clusters, this solution focuses on fewer management planes and thus reduces management costs. However, this solution cannot avoid resource waste on nodes. This issue is caused by low resource utilization of some tenants.



Sandboxed-Container allows you to isolate untrusted applications by using sandboxed virtual machines. This prevents the risks of container escapes. This also allows you to deploy different containerized applications on each node. This way, the following benefits are provided:

- Resource scheduling is simplified.
- A node is no longer exclusive to a service. This improves node resource usage and reduces resource fragments and cluster resource costs.
- Sandboxed containers use lightweight virtual machines to provide almost the same performance as containers in runC.



3.1.6.14.8. Differences between runC and runV

This topic describes the differences between runC and Sandboxed-Container (runV) in terms of their performance and pod creation methods. This allows you to better understand and utilize the benefits of sandboxed containers.

Differences between runC and runV

Item	runC	runV
Container engine	Docker and Containerd	Containerd
Node type	Elastic Compute Service (ECS) instances and ECS Bare Metal instances	EBM
Container kernel	Share the host kernel	Dedicated kernel
Container isolation	Cgroups and namespaces	Lightweight virtual machines (VMs)
Rootfs Graph Driver	OverlayFS	DeviceMapper
RootFS I/O throttling	Cgroups	DeviceMapper Block IO Limit **Note** Supported by only Sandboxed-Container V1.
NAS mounting	Not supported	Supported
Disk mounting	Not supported	Supported
Collection of container logs	Logtail directly collects container logs from the host.	logtail sidecar

Item	runC	runV
Pod Overhead	None	• Sandboxed-Container V1: For example, if you set memory: 512 Mi for a pod overhead, it indicates that 512 MiB of memory is allocated to the pod sandbox. Pod overhead refers to the amount of resources consumed by the pod sandbox. In this case, if you set a memory limit of 512 MiB for containers in the pod, the pod will request a total memory of 1,024 MiB. • Sandboxed-Container V2: The memory limit for a pod overhead is calculated based on the following formula: Memory for a pod overhead = 64 MiB + Requested memory of containers in a pod × 2%. If the result is greater than 512 MiB, the value is set to 512 Mi. If the result is smaller than 64 MiB, the value is set to 64 Mi.

Differences in pod creation between runC and runV

You can connect to clusters of Container Service by using kubectl. For more information, see Connect to a cluster through kubectl.

- Create a pod that uses runC
  i. (Optional)Use `runtimeClassName: runc` to set the container runtime to runC.

  > **Note** The preceding command is optional. runC is the default container runtime.

  ii. Run the following commands to create a pod that uses runC:

```
cat <<EOF | kubectl create -f -
apiVersion: v1
kind: Pod
metadata:
  name: busybox-runc
  labels:
    app: busybox-runc
spec:
  containers:
  - name: busybox
    image: registry.cn-hangzhou.aliyuncs.com/acs/busybox:v1.29.2
    command:
    - tail
    - -f
    - /dev/null
    resources:
      limits:
        cpu: 1000m
        memory: 512Mi
      requests:
        cpu: 1000m
        memory: 512Mi
EOF
```

- Create a pod that uses runV

i. Use `runtimeClassName: runv` to set the container runtime to runV.

ii. (Optional)Run the following command to verify that a RuntimeClass object named `runv` exists in the cluster.

```
kubectl get runtimeclass runv -o yaml
```

> **Note** A RuntimeClass object named `runv` is automatically created in a Kubernetes cluster that uses Sandboxed-Container.

iii. Run the following command to create a pod that uses runV:

```
cat <<EOF | kubectl create -f -
apiVersion: v1
kind: Pod
metadata:
  name: busybox-runv
  labels:
    app: busybox-runv
spec:
  runtimeClassName: runv
  nodeSelector:
    alibabacloud.com/container-runtime: Sandboxed-Container.runv
  containers:
  - name: busybox
    image: registry.cn-hangzhou.aliyuncs.com/acs/busybox:v1.29.2
    command:
    - tail
    - -f
    - /dev/null
    resources:
      limits:
        cpu: 1000m
        memory: 512Mi
      requests:
        cpu: 1000m
        memory: 512Mi
EOF
```

> **Notice** If the Kubernetes version is earlier than 1.16, add the following nodeSelector configuration:
>
> ```
> nodeSelector:
>     alibabacloud.com/container-runtime: Sandboxed-Container.runv
> ```

iv. Run the following command to query the pod that you have created: If the output is `runv`, it indicates that the pod is running in a sandbox.

```
kubectl get pod busybox-runv -o jsonpath={.spec.runtimeClassName}
```

v. Run the following command to log on to the pod and query its CPU and memory specifications:

```
kubectl exec -ti pod busybox-runv /bin/sh
/ # cat /proc/meminfo | head -n1
MemTotal:        1130692 kB
/ # cat /proc/cpuinfo | grep processor
processor    : 0
```

The output shows that the number of CPUs is not the same as that of the host. The total memory is the sum of pod memory and pod overhead. Be aware that the total memory is slightly smaller because the system also consumes some memory.

3.1.6.14.9. Compatibility notes

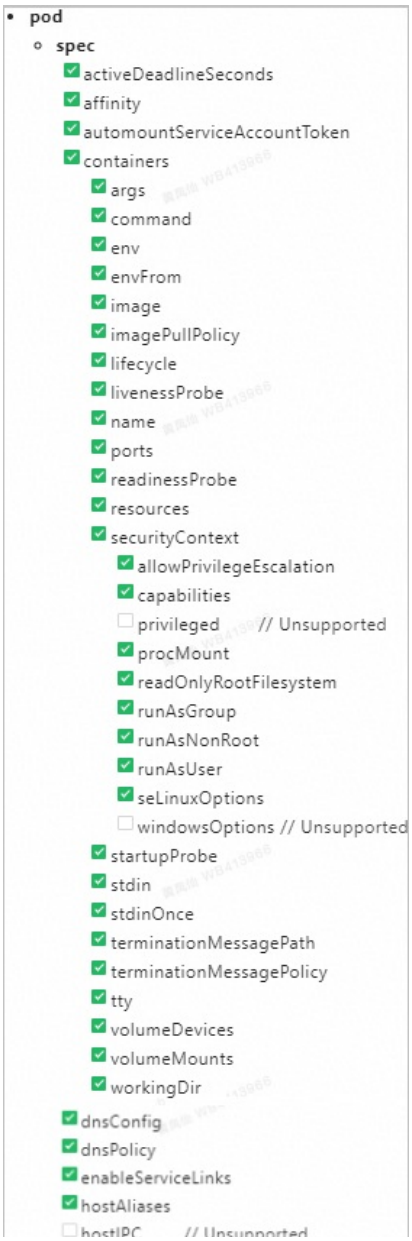
This topic describes the pod fields that are supported by Sandboxed-Container. This allows you to fully use the Sandboxed-Container runtime.

Context

Sandboxed-Container is a new runV container runtime that provides compatibility with runC in terms of pod networking, service networking (ClusterIP and NodePort), and image management. However, Sandboxed-Container does not support all pod fields. To use Sandboxed-Container, you do not need to change your development mode or image packaging method.

Supported pod fields

Sandboxed-Container supports the following pod fields that are marked by ticks:



3.1.6.15. Edge container service

3.1.6.15.1. Create an edge Kubernetes cluster

Edge Kubernetes clusters are intended for bringing cloud computing to edges (clients). Edge Kubernetes clusters can be created, managed, and maintained in the Container Service console. Container Service is a platform built on top of the edge computing infrastructure. It is also integrated with cloud computing and edge computing. This topic describes how to create an edge Kubernetes cluster.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the Clusters page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the Create Cluster page, click the **Managed Edge Kubernetes** tab and set the cluster parameters.

Parameter	Description
Cluster Name	Enter a name for the cluster. The name must be 1 to 63 characters in length, and can contain digits, letters, and hyphens (-). **Note** The cluster name must be unique among clusters that belong to the same Alibaba Cloud account.
Region	Select the region where you want to deploy the cluster.

Parameter	Description
VPC	You can select a virtual private cloud (VPC) from the drop-down list. ◦ If the specified VPC is already associated with a NAT gateway, the cluster uses this NAT gateway. ◦ Otherwise, the system automatically creates a NAT gateway. If you do not want the system to create a NAT gateway, clear **Configure SNAT for VPC**. **Note** If you disable the system to automatically create a NAT gateway and want the VPC to access the Internet, you must manually associate the VPC with a NAT gateway or create Source Network Address Translation (SNAT) rules for the VPC.
VSwitch	Select one or more vSwitches for the cluster. You can select up to three vSwitches that are deployed in different **zones**.
Kubernetes Version	Select a Kubernetes version.
Master Configurations	Set the Instance Type and System Disk parameters: ◦ Master Node Quantity: You can add up to three master nodes. ◦ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ◦ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data.
Worker Instance	You can select **Create Instance** or **Add Existing Instance**.

Parameter	Description
Worker Configurations	If **Worker Instance** is set to **Create Instance**, set the following parameters: ○ Instance Type: You can select one or more instance types. For more information, see the *Instance types* chapter of *ECS User Guide*. ○ Selected Types: The selected instance types are displayed. ○ Quantity: Set the number of worker nodes. By default, worker nodes are not required in edge Kubernetes clusters. Therefore, the value of this parameter is set to 0. ○ System Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** You can select **Enable Backup** to back up disk data. ○ Mount Data Disk: **SSD Disk** and **Ultra Disk** are supported. **Note** ■ You can select **Encrypt Disk** to encrypt disks. ■ You can select **Enable Backup** to back up disk data.
Operating System	The CentOS and Aliyun Linux operating systems are supported.
Network Plug-in	Edge Kubernetes clusters support only Flannel. You do not need to set this parameter.
Password	Set a password that is used to log on to the nodes. **Note** The password must be 8 to 30 characters in length, and must contain at least three of the following types of character: uppercase letters, lowercase letters, digits, and special characters.
Confirm Password	Enter the password again.
Pod CIDR Block and Service CIDR	These parameters are optional. For more information, see *Network planning* in *VPC User Guide*. **Note** These parameters are available only when you select an existing VPC.

Parameter	Description
Configure SNAT	This parameter is optional. If you clear Configure SNAT for VPC, you must create a NAT gateway or configure SNAT rules for the VPC. **Note** For edge Kubernetes clusters, we recommend that you select Configure SNAT for VPC.
Access to the Internet	Specify whether to expose the API server with an elastic IP address (EIP). The Kubernetes API server provides multiple HTTP-based RESTful APIs that can be used to create, delete, modify, query, and watch resource objects such as pods and Services. **Note** We recommend that you expose the API server with an EIP. ◦ If you select this check box, an EIP is created and associated with an internal-facing Server Load Balancer (SLB) instance. Port 6443 used by the API server is exposed on the master nodes. You can connect to and manage the cluster by using kubeconfig over the Internet. ◦ If you clear this check box, no EIP is created. You can connect to and manage the cluster only by using kubeconfig within the VPC.
SSH Logon	To enable Secure Shell (SSH) logon, you must first select Expose API Server with EIP. ◦ If you select Use SSH to Access the Cluster from the Internet, you can access the cluster through SSH. ◦ If you clear Use SSH to Access the Cluster from the Internet, you cannot access the cluster through SSH or kubectl. If you want to access an Elastic Compute Service (ECS) instance in the cluster through SSH, you must manually bind an elastic IP address (EIP) to the ECS instance and configure security group rules to open SSH port 22.
Log Service	If you enable Log Service, you can select an existing project or create a project. If you select **Enable Log Service**, the Log Service plug-in is automatically installed in the cluster. If you select **Create Ingress Dashboard**, Ingress access logs are collected and displayed on dashboards.
Deletion Protection	If you select this check box, the cluster cannot be deleted in the console or by calling API operations.
Node Protection	This check box is selected by default to prevent nodes from being accidentally deleted in the console or by calling API operations.

4. Complete advanced settings of the cluster.

Parameter	Description
IP Addresses per Node	The number of IP addresses that is assigned to a node. We recommend that you use the default value.
Custom Image	You can select a custom image. After you select a custom image, all nodes in the cluster are deployed by using this image.
Kube-proxy Mode	**iptables** and **IPVS** are supported. ◦ iptables is a tested and stable kube-proxy mode. It uses iptables rules to conduct service discovery and load balancing. The performance of this mode is limited by the size of the Kubernetes cluster. This mode is suitable for Kubernetes clusters that manage a small number of Services. ◦ IPVS is a high-performance kube-proxy mode. It uses Linux Virtual Server (LVS) to conduct service discovery and load balancing. This mode is suitable for Kubernetes clusters that manage a large number of Services. We recommend that you use this mode in scenarios where high-performance load balancing is required.
Node Port Range	Specify the value of **Node Port Range**.
Taints	Add taints to all of the worker nodes in the cluster. We recommend that you do not add additional taints in case the system components cannot be deployed in the edge Kubernetes cluster.
CPU Policy	Specify the CPU policy. Valid values: ◦ None: indicates that the default CPU affinity is used. This is the default policy. ◦ Static: allows pods with specific resource characteristics on the node to be granted with enhanced CPU affinity and exclusivity.
Cluster Domain	The default domain name of the cluster is cluster.local. You can specify a custom domain name.
Cluster CA	Specify whether to enable the cluster CA certificate.
User Data	Customize the startup behaviors of ECS instances and import data to the ECS instances. The user data can be used to perform the following operations: ◦ Run scripts during instance startup. ◦ Import user data as normal data to an ECS instance for future reference.

5. Click **Create Cluster** in the upper-right corner of the page.
6. On the **Confirm** page, after all check items are verified, select the terms of service and disclaimer and click **OK** to start the deployment.

Result

After the cluster is created, you can find the cluster on the **Clusters** page in the Container Service console.

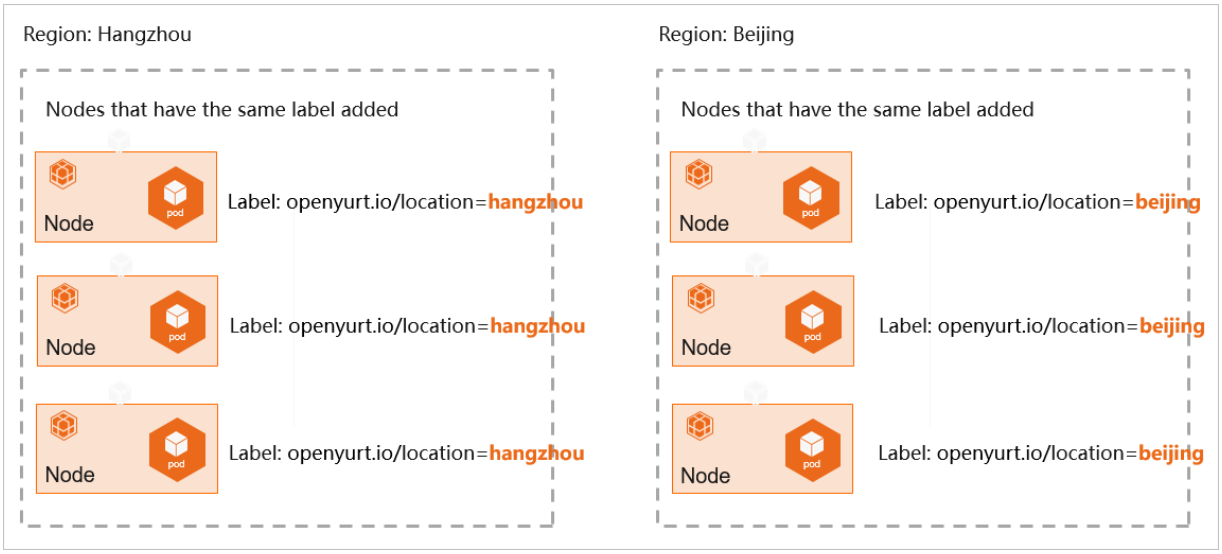
3.1.6.15.2. Edge node pools

3.1.6.15.2.1. Edge node pool overview

In edge computing scenarios, edge container service allows you to abstract nodes as edge node pools based on node attributes. This allows you to control and manage nodes in different regions in a unified manner. This topic describes edge node pools and how edge nodes are managed by edge node pools.

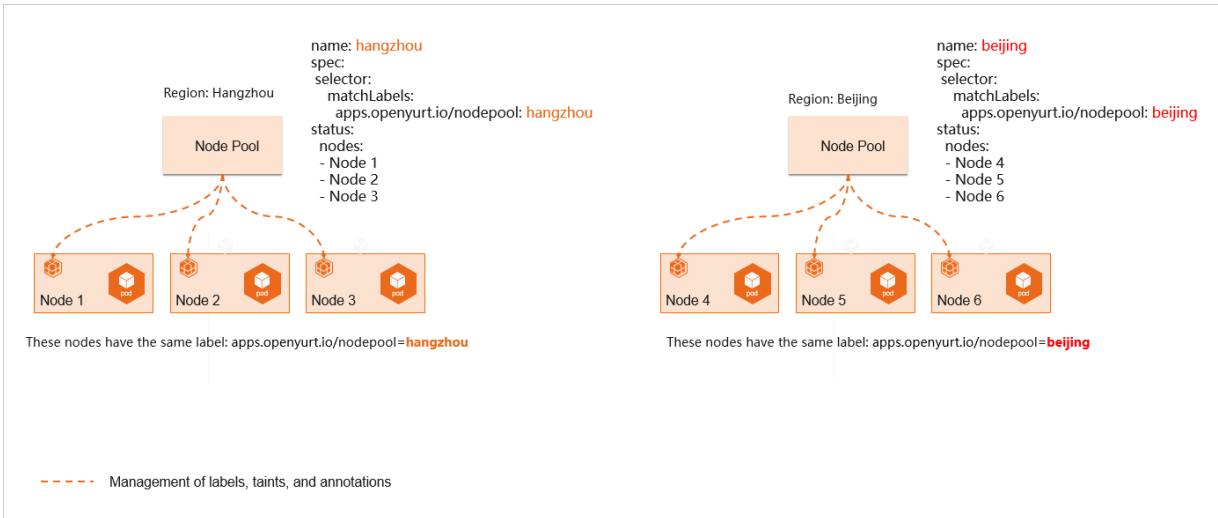
Traditional node management

In edge computing scenarios, edge nodes can be classified by different attributes such as CPU architecture, Internet service provider (ISP), and cloud service provider. Traditionally, labels are used to classify and manage nodes. However, as the numbers of nodes and labels increase, it becomes more complex to manage and maintain nodes. The following figure shows the traditional way of node management.



Edge node pools

Edge node pools allow you to classify nodes from a different dimension. You can centrally manage and maintain edge nodes that are deployed in different regions by using edge node pools, as shown in the following figure.



3.1.6.15.2.2. Create an edge node pool

An edge node pool manages a group of nodes in a cluster. For example, you can centrally manage labels and taints for the nodes in a node pool. This topic describes how to create an edge node pool in the Container Service console.

Prerequisites

- A managed edge Kubernetes cluster is created. For more information, see Create an edge Kubernetes cluster.
- The Kubernetes version of your cluster is 1.18 or later.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click its name or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, click **Create Edge Node Pool (Beta)** in the upper-right corner of the page.
6. In the **Create Edge Node Pool (Beta)** dialog box, set the parameters and click **Submit**.

Parameter	Description
Name	The name of the edge node pool.
Coordination Network between Cloud and Edge	By default, Basic is selected.
Maximum Nodes	The maximum number of nodes that can be added to the edge node pool.
Node Label	You can add labels to the nodes in the edge node pool.
Taints	You can add taints to the nodes in the edge node pool.

After the edge node pool is created, you can view information about the node pool in the node pool list.

3.1.6.15.2.3. Add nodes to an edge node pool

You can add worker nodes to an edge node pool that you created. Make sure that these worker nodes can communicate with the API server. This topic describes how to add nodes to an edge node pool.

Prerequisites

- An edge node pool is created. For more information, see Create an edge node pool.
- The Kubernetes version of your cluster is 1.18 or later.

> **Notice** You can add only nodes that run CentOS 7.4, CentOS 7.6, or Ubuntu 18.04.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane of the Container Service console, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage. Then, click the name of the cluster or click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Node Pools**.
5. On the **Node Pools** page, find the edge node pool to which you want to add nodes and click **Add Existing Node** in the **Actions** column.

Perform the same steps as you do when you add nodes to an edge Kubernetes cluster. For more information, see Add nodes to an edge Kubernetes cluster.

After you add nodes to the edge node pool, you can click **Details** in the **Actions** column to view the nodes that you added.

3.1.6.15.3. Edge nodes

3.1.6.15.3.1. Add nodes to an edge Kubernetes cluster

You can add worker nodes to an edge Kubernetes cluster in the Container Service console. However, you must make sure that the added nodes can communicate with the Kubernetes API server of the cluster. This topic describes how to add nodes to an edge Kubernetes cluster.

Prerequisites

Create an edge Kubernetes cluster

Context

By default, a cluster can contain at most 50 nodes.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, click the name of the cluster that you want to manage.
4. In the left-side navigation pane of the cluster details page, choose **Nodes > Nodes**. On the page that appears, click **Add Existing Node** in the upper-right corner.
5. On the **Select Existing ECS Instance** wizard page, click **Next Step**.

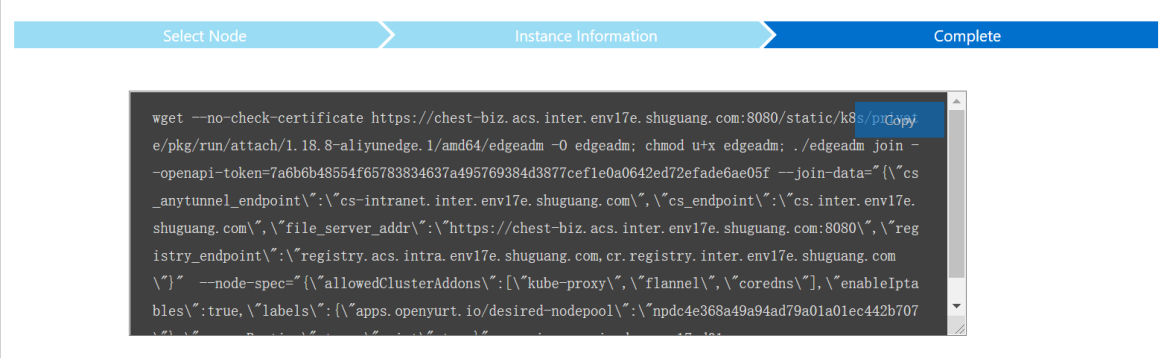
   You can only manually add nodes to edge Kubernetes clusters.
6. On the **Specify Instance Information** wizard page, set the parameters and click **Next Step**.

Parameter	Description	Default
flannelIface	The name of the network interface controller (NIC) that is used by the Flannel plug-in.	The name of the NIC that is specified in the default route entry of the node.
enableIptables	Specifies whether to enable iptables.	false
quiet	Specifies whether to answer all questions with yes when you add nodes.	false
manageRuntime	Specifies whether to use edgeadm to install and manage the runtime.	false

Parameter	Description	Default
nodeNameOverride	The name of the node.	◦ "". This is the default value. This value specifies that the hostname is used as the node name. ◦ "*". This value specifies that a random string that contains six characters is used as the node name. ◦ "*."*.XXX". This value specifies that a random string that is followed by a suffix is used as the node name. The random string contains six characters.
allowedClusterAddons	The list of add-ons to be installed. By default, this parameter is empty. This indicates that no add-on is installed. For a standard edge node, set this parameter to ["kube-proxy","flannel","coredns"].	[]
gpuVersion	Specifies whether the node to be added is a GPU-accelerated node. By default, this parameter is empty. Supported GPU models are Nvidia_Tesla_T4, Nvidia_Tesla_P4, and Nvidia_Tesla_P100.	"". This is the default value. This value specifies that the node to be added is not a GPU-accelerated node.
inDedicatedNetwork	Specifies whether an Express Connect circuit is used to connect to the managed edge Kubernetes cluster.	false
labels	Specifies the labels to be added to the node.	{}
annotations	Specifies the annotations to be added to the node.	{}

Parameter	Description	Default
nodeIface	This parameter specifies the following information: ○ Specifies the node IP address that kubelet retrieves from the specified network interface. If you do not specify this parameter, kubelet attempts to retrieve the node IP address in the following order: ■ Searches */etc/hosts* for the node whose name is the same as the specified hostname. ■ Finds the IP address of the network interface that is specified in the default route entry of the node. ○ Specifies the name of the NIC that is used by the Flannel plug-in. In this case, this parameter is equivalent to the flannelIface parameter. This parameter will soon replace the flannelIface parameter.	""

7. On the **Complete** wizard page, copy the script to the node that you want to add to the edge Kubernetes cluster and click **Done**.



8. Log on to the edge node and execute the script. This way, the node is added to the edge Kubernetes cluster.

3.1.6.15.3.2. Configure node autonomy

If an edge node is autonomous, applications run as expected on the edge node even if the edge node is disconnected from the cloud. This ensures that applications are not removed or migrated to other edge nodes in the case of network errors. This topic describes how to set the autonomy attribute for edge nodes.

Prerequisites

- Create an edge Kubernetes cluster
- Add nodes to an edge Kubernetes cluster

Context

You can enable or disable node autonomy in the Container Service console.

- If an autonomous edge node is disconnected from the cloud, Container Service does not migrate applications on this node to other nodes, and the applications are automatically restored. Node autonomy is applicable to edge computing scenarios where the network connection is weak.
- If a non-autonomous edge node is disconnected from the cloud, the node fails to send heartbeats to the nodes in the cloud. As a result, the state of the node is changed to **Not Ready** and the applications on the node are removed or migrated to other nodes after a specific time period.

Procedure

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Nodes > Nodes**.
5. On the **Nodes** page, find the node that you want to manage and choose **More > Node Autonomy Setting** in the **Actions** column.

   > **Note** The **Node Autonomy Setting** option is available only to edge nodes.

6. In the **Node Autonomy Setting** dialog box, click **OK**.

   > **Note** By default, edge nodes are not autonomous when they are added to the cluster. You can follow the preceding steps to enable or disable node autonomy.

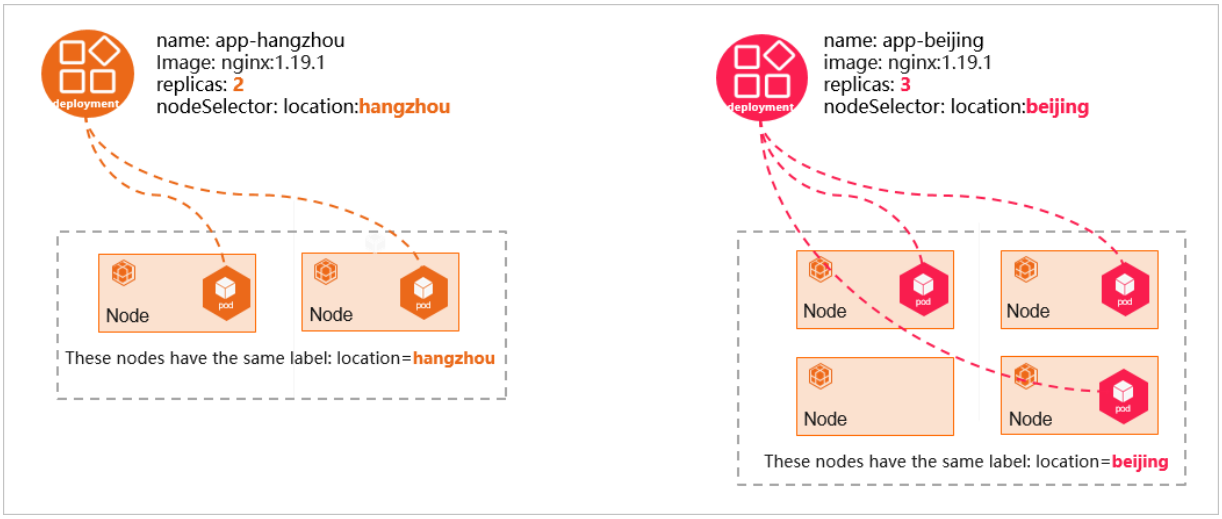
3.1.6.15.4. Cell-based management at the edge

3.1.6.15.4.1. Use the UnitedDeployment controller to deploy applications

In edge computing scenarios, you can use the UnitedDeployment controller to deploy applications to different node pools. This way, you can centrally manage the number of pods and the image version of containers by using node pools. This topic describes how to use the UnitedDeployment controller to deploy applications.

Context

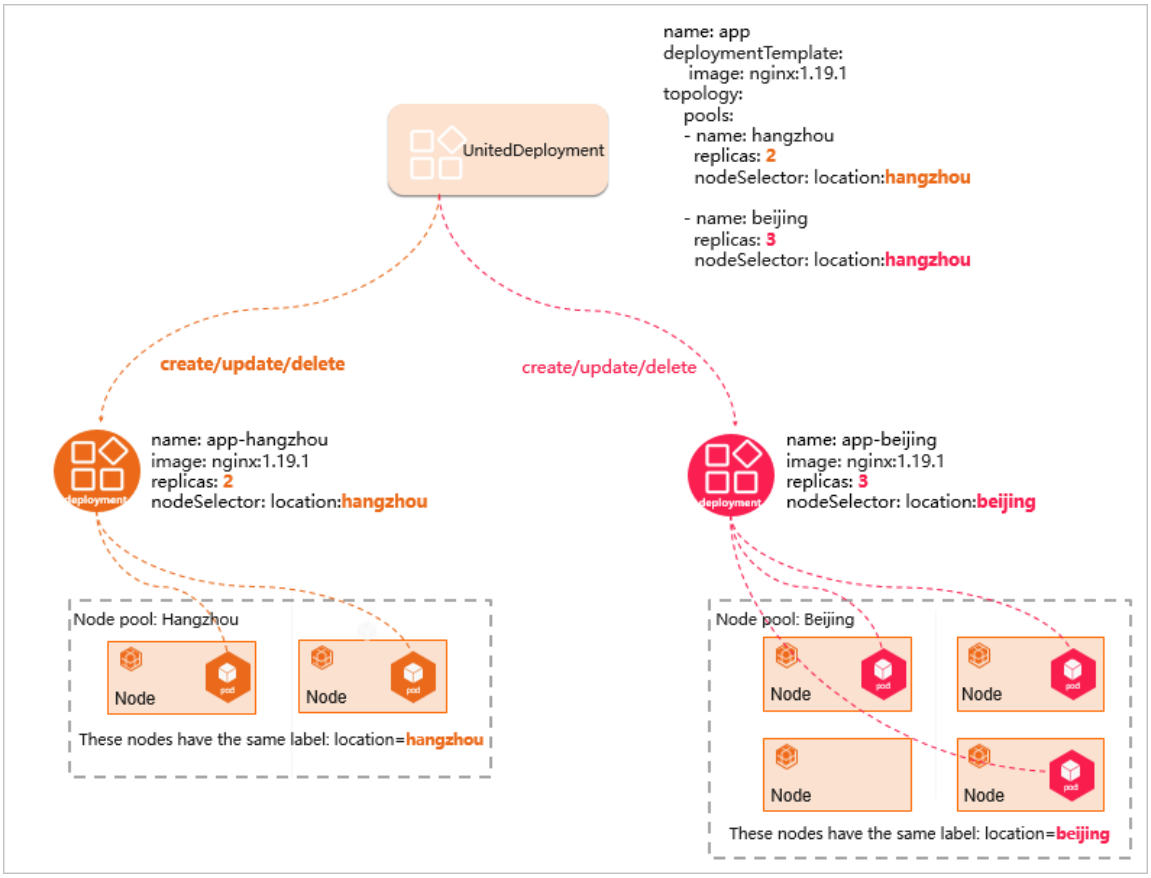
In edge computing scenarios, computing nodes may be deployed across regions, and an application may run on nodes in different regions. A Deployment is used as an example in this topic. Traditionally, you add the same label to the nodes that are deployed in the same region and create multiple Deployments. These Deployments are deployed to nodes in different regions by matching node selectors.



Application management and maintenance become more complex with the increasing number of regions and differentiated requirements for applications in different regions. The following list describes the main challenges:

- When a new image version is released, you must modify the image version for each Deployment.
- You must customize naming conventions to identify Deployments that belong to the same application.
- Deployments that belong to the same application are configured in the same way, except for the name, node selector, and number of replicated pods.

The UnitedDeployment controller is a feature provided for dedicated edge Kubernetes clusters. This feature allows you to centrally manage Deployments from a different dimension. For example, you can create, update, and delete multiple Deployments at a time.



The UnitedDeployment controller provides a template to define applications. This template allows you to deploy workloads in different regions and define the nodes in each region as a node pool. The UnitedDeployment controller supports two types of workload: StatefulSet and Deployment. The UnitedDeployment controller creates Deployments or StatefulSets based on the configurations of node pools. You can specify the number of replicated pods for each type of workload. UnitedDeployment enables automatic management and maintenance of multiple Deployments or StatefulSets within individual node pools. In addition, you can create differentiated configurations for these Deployments or StatefulSets, such as the name, node selector, and number of replicated pods.

Create a UnitedDeployment

Create a UnitedDeployment to deploy Deployments.

The following YAML template is an example:

```
apiVersion: apps.openyurt.io/v1alpha1
kind: UnitedDeployment
metadata:
  name: example
  namespace: default
spec:
  revisionHistoryLimit: 5
  selector:
    matchLabels:
      app: example
  workloadTemplate:
    deploymentTemplate:
      metadata:
        creationTimestamp: null
        labels:
          app: example
      spec:
        selector:
          matchLabels:
            app: example
        template:
          metadata:
            creationTimestamp: null
            labels:
              app: example
          spec:
            containers:
            - image: nginx:1.19.3
              imagePullPolicy: Always
              name: nginx
            dnsPolicy: ClusterFirst
            restartPolicy: Always
  topology:
    pools:
    - name: cloud
      nodeSelectorTerm:
        matchExpressions:
        - key: apps.openyurt.io/nodepool
          operator: In
          values:
          - cloud
      replicas: 2
    - name: edge
      nodeSelectorTerm:
        matchExpressions:
        - key: apps.openyurt.io/nodepool
          operator: In
          values:
          - edge
      replicas: 2
      tolerations:
      - effect: NoSchedule
        key: apps.openyurt.io/taints
        operator: Exists
```

The following table describes the fields in the YAML template.

Field	Description
spec.workloadTemplate	The workload template. Valid values: `deploymentTemplate and statefulSetTemplate`.
spec.topology.pools	Configurations of multiple node pools.
spec.topology.pools[*].name	The name of the node pool.
spec.topology.pools[*].nodeSelectorTerm	Specifies node affinity for the node pool. Set the key to `apps.openyurt.io/nodepool` and the value to the name of the node pool.
spec.topology.pools[*].tolerations	Sets tolerations for the node pool.
spec.topology.pools[*].replicas	The number of pods in each node pool.

Use the UnitedDeployment controller to manage pods

- Upgrade pods: You can modify the `spec.template.workloadTemplate.deploymentTemplate` field to trigger pod upgrades. The UnitedDeployment controller updates the workload template for all node pools. Then, the node pool controller upgrades the pods in the node pools.
- Scale the number of replicated pods for multiple node pools: You can modify the `spec.topology.pools` field to change the number of replicated pods for multiple node pools. Then, the replicated pods in the node pools are scaled based on the configuration.

3.1.6.15.4.2. Configure a Service topology

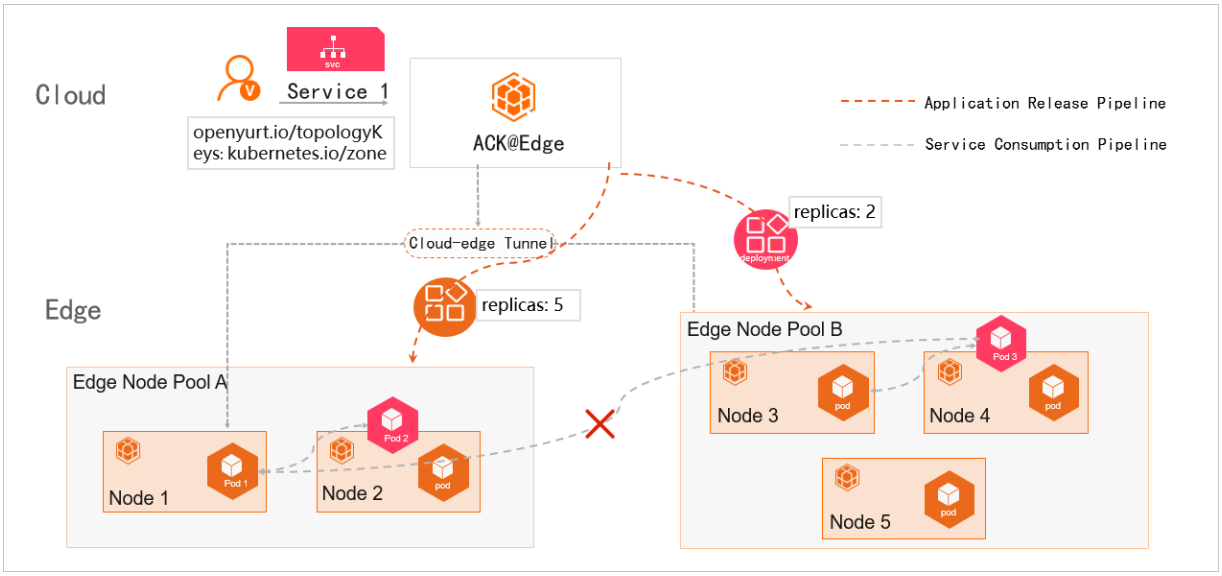
The backend endpoints of Kubernetes-native Services are randomly distributed across nodes. Consequently, when Service requests are distributed to nodes across node groups, these requests may fail to reach the nodes or may not be answered promptly. You can configure a Service topology to expose an application on an edge node only to the current node or nodes in the same edge node pool. This topic describes how a Service topology works and how to configure a Service topology.

Context

In edge computing, edge nodes are classified into groups by zone, region, and other logical attributes, such as CPU architecture, Internet service provider (ISP), or cloud service provider. Nodes in different groups are isolated from each other in one way or another. For example, these nodes may not be able to connect to each other, may not share the same resources, may have heterogeneous resources, and may run applications that are independent of each other.

How a Service topology works

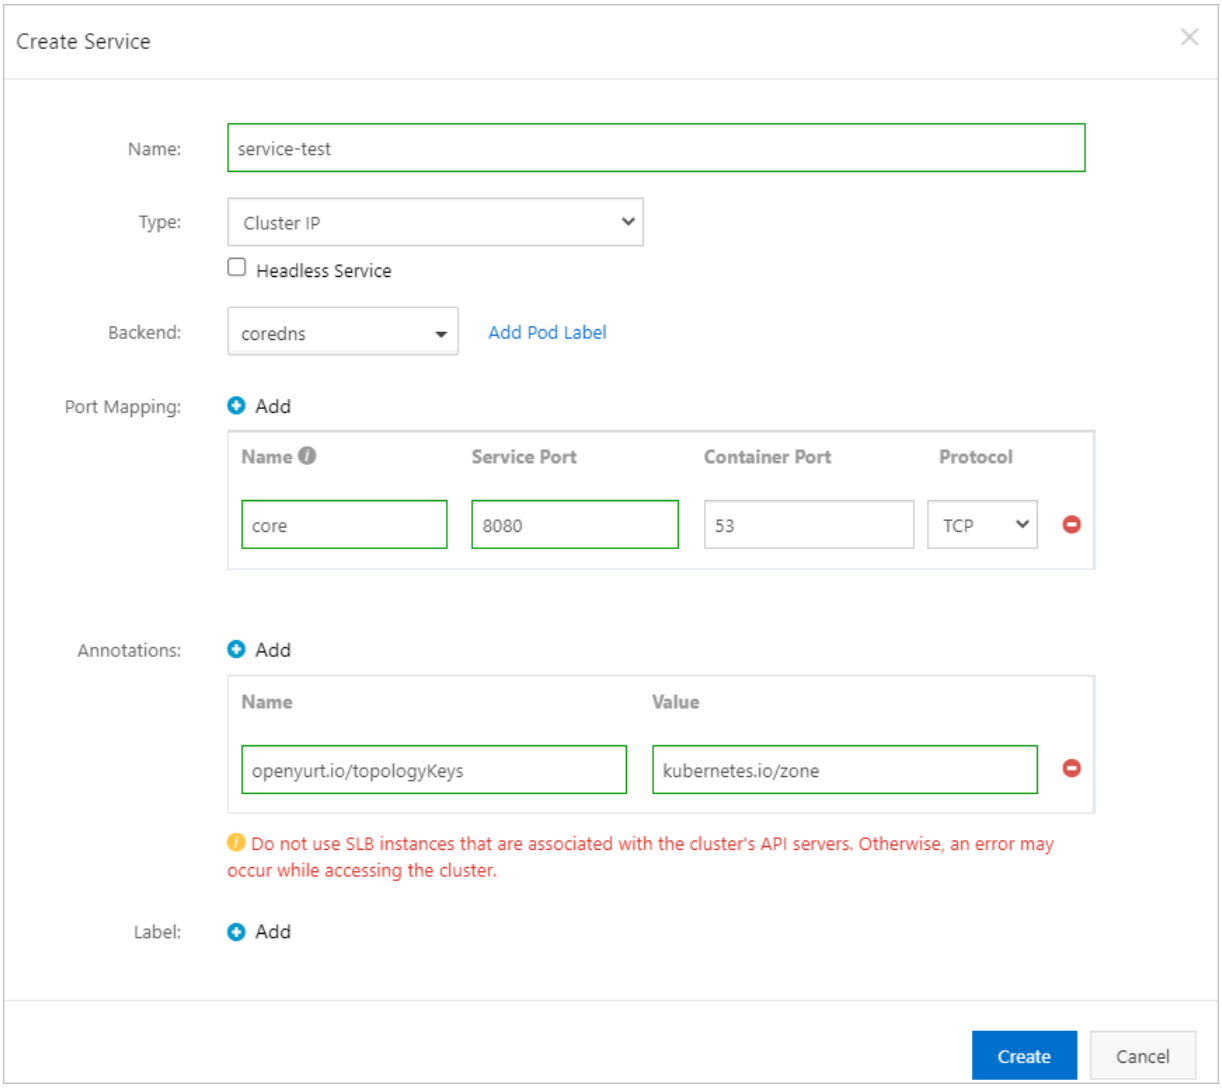
To solve the preceding issues, dedicated edge Kubernetes clusters provide a feature to manage the topology of endpoints of Kubernetes-native Services. You can configure a Service topology to specify how endpoints of a Service are accessed. For example, you can configure a Service topology to expose an application on an edge node only to the current node or nodes in the same edge node pool. The following figure shows how a Service topology works.



- Service 1 is associated with Pod 2 and Pod 3. `annotation:"openyurt.io/topologyKeys: kubernetes.io/zone"` specifies the node pool that is allowed to access Service 1.
- Pod 2 is deployed on Node 2 and Pod 3 is deployed on Node 3. Node 2 belongs to Node Pool A and Node 3 belongs to Node Pool B.
- Pod 3 and Pod 1 do not belong to the same node pool. As a result, when Pod 1 accesses Service 1, the traffic is forwarded only to Pod 2. The traffic is not forwarded to Pod 3.

Method 1: Configure a Service topology in the console

To create a Service that can be accessed only by the node pool where the Service is deployed, you only need to add an annotation to the Service. For example, you can set **Name** to `openyurt.io/topologyKeys` and **Value** to `kubernetes.io/zone`. For more information about how to create a Service, see Create a Service.



Method 2: Configure a Service topology by using a CLI

You can use a CLI to configure a Service topology in the following ways:

- Create a Service that uses the topological domain of a specific node pool. The following code block is an example of the YAML template:

```
apiVersion: v1
kind: Service
metadata:
  annotations:
    openyurt.io/topologyKeys: kubernetes.io/zone
  name: my-service-nodepool
  namespace: default
spec:
  ports:
  - port: 80
    protocol: TCP
    targetPort: 8080
  selector:
    app: nginx
  sessionAffinity: None
  type: ClusterIP
```

- Run the following command to configure the Service topology. The Service uses the topological domain of the specified node pool.

```
kubectl annotate service xxx openyurt.io/topologyKeys='kubernetes.io/zone'
```

Annotations

You can add annotations to a Kubernetes-native Service to configure a Service topology. The annotations are described in the following table.

annotation Key	annotation Value	Description
openyurt.io/topologyKeys	kubernetes.io/hostname	Specifies that the Service can be accessed only by the node where the Service is deployed.
openyurt.io/topologyKeys	kubernetes.io/zone	Specifies that the Service can be accessed only by the nodes in the node pool where the Service is deployed.
None	None	Specifies that access to the Service is unlimited.

3.1.6.15.5. Cloud-edge tunneling

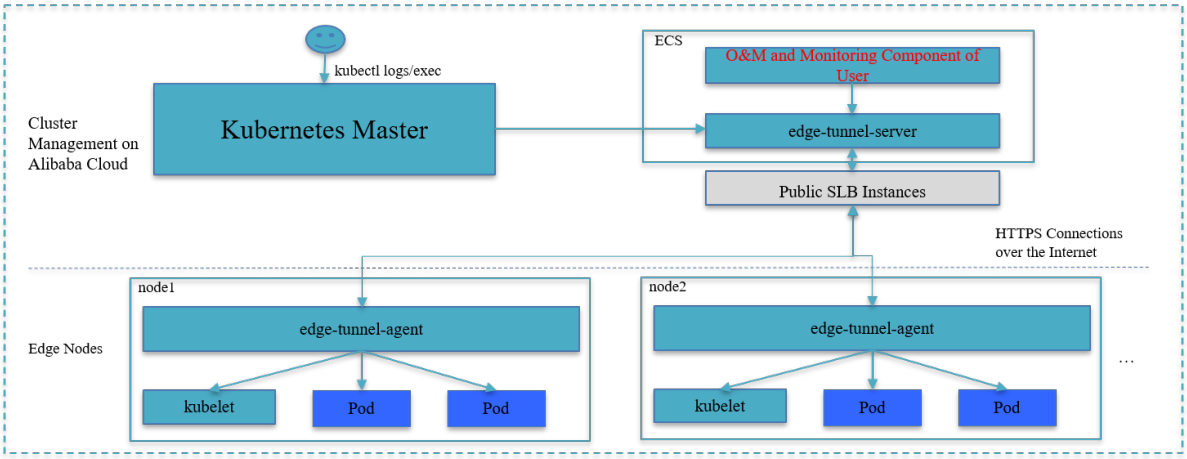
By default, Container Service deploys the **edge-tunnel-server or edge-tunnel-agent** component after you create a cluster. This improves user experience. These components are used to establish tunnels from the cloud to the edge. After the tunnels are established, you can access edge nodes from the cloud. This topic describes the tunneling components provided by managed edge Kubernetes clusters and the features of these components.

Background information

- In a Kubernetes cluster, the controller components in the cloud must run commands in kubelet to manage and maintain edge nodes. The monitoring components must retrieve monitoring data of edge nodes from the cloud. If the edge nodes of a managed edge Kubernetes cluster are deployed in an internal network, you cannot directly access the edge nodes from the cloud.
- The **edge-tunnel-server** component is deployed as a Deployment on nodes in the cloud. The **edge-tunnel-agent** component is deployed as a DaemonSet on each edge node.

Introduction

- edge-tunnel-server is automatically installed on master nodes when you create an edge Kubernetes cluster.
- To establish secure and encrypted tunnels over the Internet, the system creates a Server Load Balancer (SLB) instance for the Service that is created by **edge-tunnel-server**. The **edge-tunnel-agent** component on each edge node establishes a tunnel to the cloud through the SLB instance. The following figure shows how cloud-edge tunneling works.



Note

- When edge nodes are disconnected from the cloud or the network connection is weak, the tunnels may fail to work as normal.
- If you delete or stop the SLB instance through which the tunnels are established, the tunnels cannot work as normal.

3.1.6.16. Use the Kubernetes event center

The event center feature allows you to log Kubernetes events, query events, and configure alerting. This topic describes how to enable and view the Kubernetes event center.

Enable the Kubernetes event center

Enable the Kubernetes event center when a Kubernetes cluster is created

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**. On the page that appears, click **Create Kubernetes Cluster** in the upper-right corner.
3. On the **Create Cluster** page, select **Install node-problem-detector and Create Event Center** in the **Log Service** field. For more information about other parameters, see Create a Kubernetes cluster. Then, click **Create Cluster**.
4. On the **Confirm** dialog box, after all check items are verified, select the terms of service and disclaimer and click **OK** to create the cluster.

Enable the Kubernetes event center in App Catalog

1. Log on to the Container Service console.
2. In the left-side navigation pane, choose **Marketplace > App Catalog**.
3. On the **App Catalog** page, find and click ack-node-problem-detector.
4. On the **App Catalog - ack-node-problem-detector** page, click the **Parameters** tab and set `eventer.sinks.sls.enabled` to `true`.

```
sinks:
  sls:
    enabled: true
    # If you want the monitoring results to be notified by sls, set enabled to true.
    topic: ""
    project:  "k8s-log-cc7640381ac7f4a99971f55a2744a2748"
    # You can view the project information by logging in to the
    # SLS console. Please fill in the name of the project here.
    # eg: your project name is k8s-log-cc18a5f3443dhdss22654da,
    # then you can fill k8s-log-cc18a5f3443dhdss22654da to project label.
    logstore: "k8s-event"
    # You can view the project information by logging in to the
    # SLS console. Please fill the logstore address in here.
```

5. On the **App Catalog - ack-node-problem-detector** page, click the **Description** tab.
6. In the **Deploy** pane, select the cluster and click **Create**.

Access the Kubernetes event center

Access the Kubernetes event center in the Container Service console

1. Log on to the Container Service console.
2. In the left-side navigation pane, click **Clusters**.
3. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
4. In the left-side navigation pane of the details page, choose **Operations > Event Center**.
5. Access the Kubernetes event center on the Event Center page

   > **Note** If the Event Center page does not appear, check whether the Kubernetes event center is enabled.

   - On the **Event Center** page, click the **Events Overview** tab to go to the overview page of the Kubernetes event center.
   - On the **Event Center** page, click the **Cluster Events Query** tab to customize query conditions.
   - On the **Event Center** page, click the **Pod Events** tab to query events of pods.

Access the Kubernetes event center by using Log Service

1. View the cluster ID.
   i. Log on to the Container Service console.
   ii. In the left-side navigation pane, click **Clusters**.
   iii. On the **Clusters** page, find the cluster that you want to manage and click **Details** in the **Actions** column.
   iv. Click the **Basic Information** tab to view the cluster ID.
2. Log on to the Log Service console.
3. In the search box of the Projects section, enter and click k8s-log-<CLUSTER_ID>.

   > **Note** Replace the CLUSTER_ID with the cluster ID that you obtained in Step .

4. In the Logstores section, choose **K8s-event > Visual Dashboards > Kubernetes Event Center V1.2**.
5. On the **Kubernetes Event Center V1.2** page, you can view the trends of WARNING events and ERROR events.

4.Auto Scaling (ESS)

4.1. User Guide

4.1.1. What is Auto Scaling?

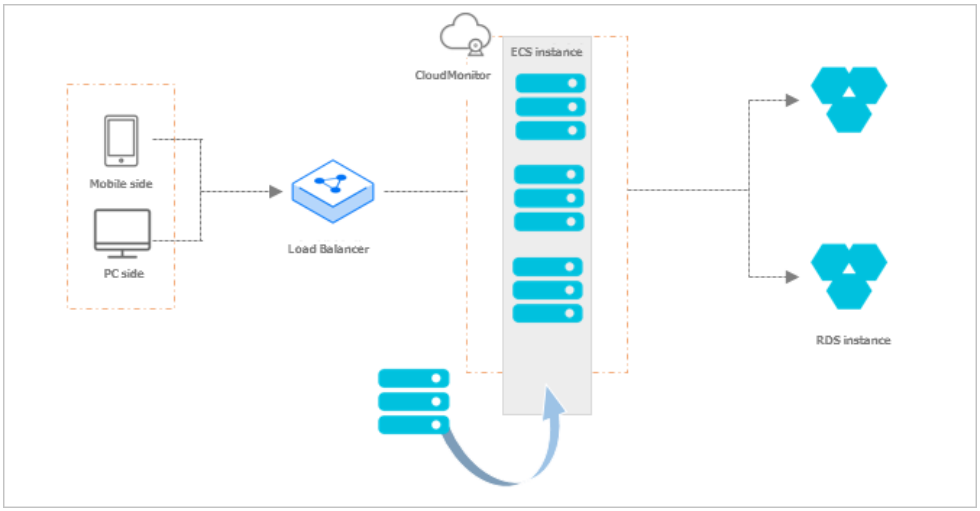
Auto Scaling automatically adjusts your elastic computing resources based on your business requirements and policies that you define.

When demand for services spikes, Auto Scaling automatically scales out Elastic Compute Service (ECS) instances based on your configurations to maintain sufficient computing resources. When demand for services drops, Auto Scaling automatically scales in ECS instances to save costs.

Auto Scaling provides the following features:

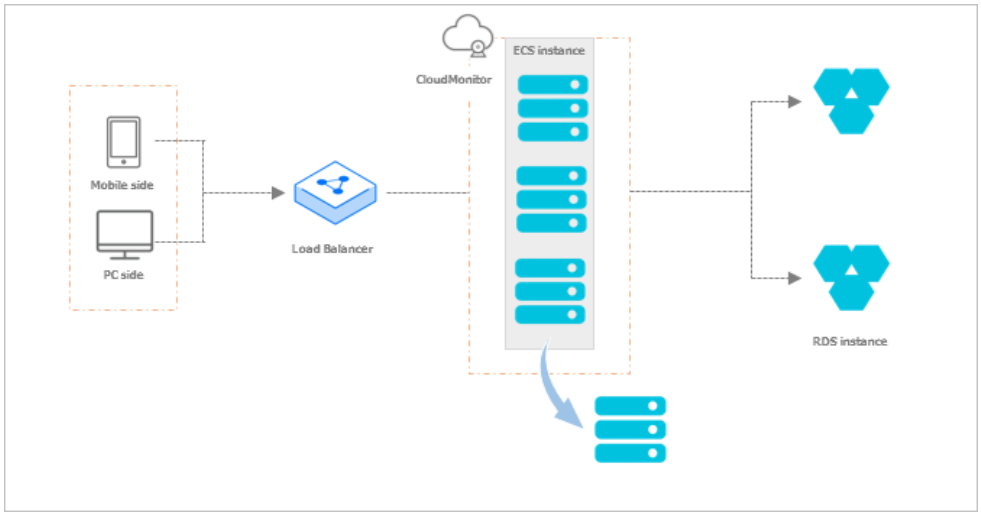
- Scale-out

  When demand for services suddenly grows, Auto Scaling automatically scales out the underlying resources. This ensures that resources are not overloaded and maintains the responsiveness of your servers. For example, if the vCPU utilization of ECS instances exceeds 80%, Auto Scaling scales out ECS resources based on your configurations. During the scale-out event, Auto Scaling automatically creates ECS instances, adds the ECS instances to a scaling group, and then adds the new instances to the backend server groups of the associated Server Load Balancer (SLB) instances and the whitelists of the associated ApsaraDB RDS instances. The following figure shows how a scale-out event is implemented.



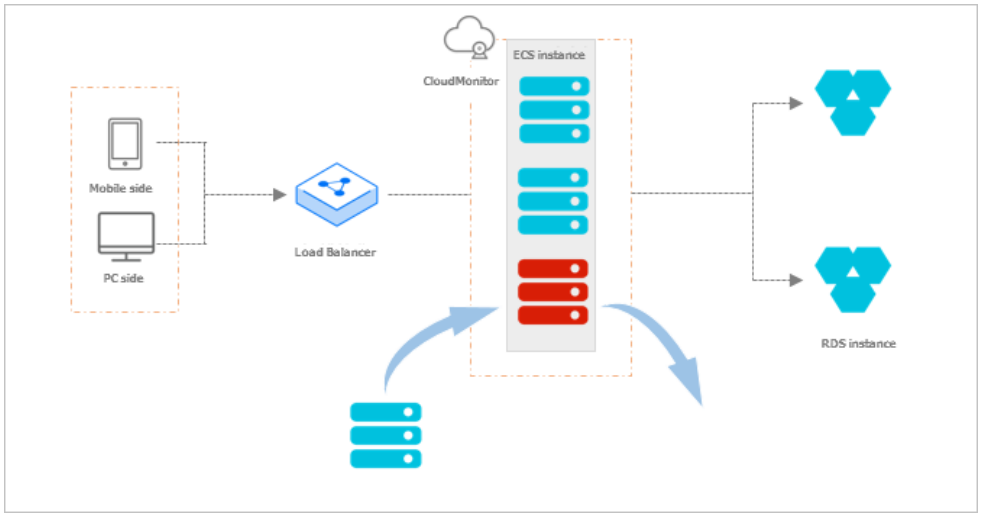
- Scale-in

  When demand for services drops, Auto Scaling automatically releases underlying resources to prevent waste of resources and reduce costs. For example, if the vCPU utilization of ECS instances in a scaling group falls below 30%, Auto Scaling automatically scales in ECS instances based on your configurations. During the scale-in event, Auto Scaling removes ECS instances from the scaling group and also from the backend server groups of the associated SLB instances and the whitelists of the associated ApsaraDB RDS instances. The following figure shows how a scale-in event is implemented.



- Elastic recovery

  If ECS instances in a scaling group are not in the Running state, Auto Scaling considers the instances to be unhealthy. If an ECS instance is considered unhealthy, Auto Scaling automatically releases the instance and creates a new one. This process is called elastic recovery. Elastic recovery ensures that the number of healthy ECS instances in a scaling group does not fall below the minimum number of ECS instances that you specified for the scaling group. The following figure shows how an elastic recovery event is implemented.



4.1.2. Notes

4.1.2.1. Precautions

This topic describes the precautions when you use Auto Scaling (ESS).

Scaling rules

ESS uses scaling rules to scale ECS instances in a scaling group based on the minimum and maximum numbers of ECS instances specified for the scaling group. Assume that a scaling group can contain up to 45 ECS instances. If you configure a scaling rule to increase the number of ECS instances in the scaling group to 50, ESS only increases the number of ECS instances to 45 at most.

Scaling activities

- Only one scaling activity can be executed at a time in a scaling group.
- An ongoing scaling activity cannot be terminated. For example, if a scaling activity is being executed to create

20 ECS instances but only five have been created, you cannot forcibly terminate the scaling activity.

- If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back the ECS instances that fails to be added but not the scaling activity. For example, if ESS has created 20 ECS instances for a scaling group, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

Cooldown period

- During the cooldown period, if you manually execute a scaling task, such as a scaling rule or scheduled task, the task is immediately executed without waiting for the cooldown period to expire.
- The cooldown period starts after the last ECS instance is added to or removed from a scaling group during a scaling activity.

4.1.2.2. Manual operations

If you perform a manual operation when an Auto Scaling operation is in progress, the manual operation takes precedence.

Auto Scaling supports manual operations, such as the deletion of automatically created Elastic Compute Service (ECS) instances from the ECS console. The following table describes how Auto Scaling processes manual operations.

Resource	Manual operation type	Processing method
ECS	A user deletes an ECS instance from a scaling group by using the ECS console or calling API operations.	Auto Scaling performs health checks to determine whether the ECS instance is unhealthy. If the instance is unhealthy, Auto Scaling removes it from the scaling group. The internal IP address of the ECS instance is not automatically deleted from the whitelist of the associated ApsaraDB RDS instance. If the total number of ECS instances in the scaling group falls below the lower limit after the ECS instance is removed, the scaling group automatically creates an ECS instance to ensure that the number of instances is at least equal to the lower limit.
ECS	A user revokes the ECS API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests.
Server Load Balancer (SLB)	A user manually removes an ECS instance from the associated SLB instance by using the SLB console or calling API operations.	Auto Scaling does not automatically detect this operation or handle this exception. The ECS instance remains in the scaling group. When a scale-in activity is triggered, Auto Scaling releases the ECS instance if the instance meets the conditions specified in the removal policy.
SLB	A user manually deletes an SLB instance or disables the health check feature for an SLB instance by using the SLB console or calling API operations.	Auto Scaling does not add ECS instances to scaling groups that are associated with this SLB instance. Auto Scaling removes ECS instances from the scaling groups if a scaling task triggers a scale-in rule or the ECS instances are considered unhealthy after a health check is performed.
SLB	An SLB instance is unavailable due to a system error.	All scaling activities fail, except for instance removal tasks that are manually executed.

Resource	Manual operation type	Processing method
SLB	A user revokes the SLB API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests for the scaling groups that are associated with SLB instances.
ApsaraDB RDS	A user manually removes the IP address of an ECS instance from the whitelist of the associated ApsaraDB RDS instance by using the ApsaraDB RDS console or calling API operations.	Auto Scaling does not automatically detect this operation or handle this exception. The ECS instance remains in the scaling group. When a scale-in activity is triggered, Auto Scaling releases the ECS instance if the instance meets the conditions specified in the removal policy.
ApsaraDB RDS	A user manually deletes an ApsaraDB RDS instance by using the ApsaraDB RDS console or calling API operations.	Auto Scaling does not add ECS instances that are associated with the ApsaraDB RDS instance to scaling groups. Auto Scaling removes ECS instances from the scaling groups if a scaling task triggers a scale-in rule or the ECS instances are considered as unhealthy after a health check is performed.
ApsaraDB RDS	An ApsaraDB RDS instance is unavailable due to a system error.	All scaling activities fail, except for instance removal tasks that are manually executed.
ApsaraDB RDS	A user revokes the ApsaraDB RDS API permissions granted to Auto Scaling.	Auto Scaling rejects all scaling activity requests for the scaling groups that are associated with ApsaraDB RDS instances.

4.1.2.3. Limits

This topic describes the limits of Auto Scaling.

- Auto Scaling can automatically scale the number of Elastic Compute Service (ECS) instances in a scaling group, but cannot automatically upgrade or downgrade configurations of the ECS instances, such as vCPUs, memory, and bandwidth.
- Applications deployed on the ECS instances in a scaling group must be stateless and horizontally scalable.
- ECS instances in a scaling group can be automatically released. We recommend that you do not store information such as sessions, application data, or logs on the ECS instances in a scaling group. If you need to store data of the applications deployed on the ECS instances, store status information such as sessions on the independent ECS instances, store application data in ApsaraDB RDS, and store logs in Log Service. For more information, see *What is ApsaraDB RDS?* in *ApsaraDB RDS Product Introduction* and *What is Log Service?* in *Log Service Product Introduction*.
- The following table describes the quantity limits that are applied to a scaling group.

Item	Quota
Scaling configuration	You can create a maximum of 10 scaling configurations in a scaling group.
Scaling rule	You can create a maximum of 50 scaling rules in a scaling group.
ECS instance	You can add a maximum of 1,000 ECS instances to a scaling group.

4.1.2.4. Scaling group status

This topic describes the states of a scaling group in the console and in an API operation.

State in the console	State in an API operation
Creating	Inactive
Created	Inactive
Enabling	Inactive
Enabled	Active
Disabling	Inactive
Disabled	Inactive
Deleting	Deleting

4.1.2.5. Scaling processes

Before you use Auto Scaling, you must understand the processes related to scaling activities.

Automatic scaling of a scaling group

- Automatic scale-out
  i. Check the health status and boundary conditions of the scaling group.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Create ECS instances.
  iv. Modify Total Capacity.
  v. Assign IP addresses to the created ECS instances.
  vi. Add the ECS instances to the whitelist of the associated ApsaraDB RDS instance.
  vii. Start the ECS instances.
  viii. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified when the scaling configuration is created.
  ix. The cooldown period starts after the scaling activity is complete.
- Automatic scale-in
  i. Check the health status and boundary conditions of the scaling group.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Remove ECS instances from the associated SLB instance.
  iv. Stop the ECS instances.
  v. Remove the ECS instances from the whitelist of the associated ApsaraDB RDS instance.
  vi. Release the ECS instances.
  vii. Modify Total Capacity.
  viii. The cooldown period starts after the scaling activity is complete.

Manually add or remove existing ECS instances

- Manually add instances
  i. Check the health status and boundary conditions of the scaling group, and check the status and type of ECS instances.
  ii. Assign the activity ID and execute the scaling activity.
  iii. Add the ECS instances.

iv. Modify Total Capacity.
v. Add the ECS instances to the whitelist of the associated ApsaraDB RDS instance.
vi. Associate the ECS instances with an SLB instance and set the weight to the SLB weight value that is specified in the active scaling configuration.

> **Note** If you want to manually add an instance to a scaling group, the instance type of the instance must be the same as that specified in the active scaling configuration of the scaling group. Therefore, you must set the weight to the SLB weight value that is specified in the active scaling configuration.

vii. The cooldown period starts after the scaling activity is complete.

- Manually remove instances
  i. Check the health status and boundary conditions of the scaling group.
  ii. Assign the activity ID and execute the scaling activity.
  iii. SLB stops forwarding traffic to ECS instances.
  iv. Remove the ECS instances from SLB after 60 seconds.
  v. Remove the ECS instances from the whitelist of the associated ApsaraDB RDS instance.
  vi. Modify Total Capacity.
  vii. Remove the ECS instances from the scaling group.
  viii. After the scaling activity is complete, the cooldown period starts.

4.1.2.6. Remove unhealthy ECS instances

Before you use ESS, you must understand information about the removal of unhealthy ECS instances.

After an ECS instance is added to a scaling group, ESS checks the status of the instance on a regular basis. If the ECS instance is not in the Running state, ESS removes the ECS instance from the scaling group. The removal method depends on how the ECS instance is added:

- If an ECS instance is automatically created, ESS immediately removes and releases it.
- If an ECS instance is manually added, ESS immediately removes it, but does not stop or release it.

The removal of unhealthy ECS instances is not limited by the MinSize value. After the unhealthy ECS instances are removed, the number of ECS instances (Total Capacity) may fall below the MinSize value. In this case, ESS automatically creates ECS instances based on the difference between the actual instance number and MinSize value to ensure that the total number of ECS instances is equal to the MinSize value.

4.1.2.7. Instance rollback after a failed scaling activity

Before you use ESS, you must understand the mechanism of instance rollback after a failed scaling activity.

If some ECS instances fail to be added to a scaling group during a scaling activity, ESS considers that the scaling activity is complete without trying to add the failed instances to the scaling group. ESS rolls back ECS instances, not the scaling activity.

For example, if a scaling group has created 20 ECS instances, and 19 of the instances are added to SLB instances, only the one ECS instance that failed to be added is automatically released.

4.1.2.8. Instance lifecycle management

Before you use Auto Scaling, we recommend that you understand the instance lifecycle.

Automatically created ECS instances

The ECS instances are automatically created by Auto Scaling based on user-defined scaling configurations and rules.

Auto Scaling manages the entire lifecycle of automatically created ECS instances. Auto Scaling creates ECS instances during scale-out activities, and stops and releases ECS instances during scale-in activities.

Manually added ECS instances

The ECS instances are manually added to scaling groups.

Auto Scaling does not manage the entire lifecycle of manually added ECS instances. These instances are not automatically created by Auto Scaling but are manually added by a user to a scaling group. If the ECS instances are manually or automatically removed from the scaling group, Auto Scaling removes the instances but does not stop or release them.

Instance status

An ECS instance in a scaling group can change to the following status during its lifecycle:

- Pending: The ECS instance is being added to the scaling group. The instance is being created, added as the backend server of the associated SLB instance, or added to the whitelist of the associated ApsaraDB RDS instance.
- InService: The ECS instance is added to the scaling group and is providing services as expected.
- Removing: The ECS instance is being removed from the scaling group.

Instance health status

An ECS instance in a scaling group can change to the following health status:

- Healthy
- Unhealthy

If an ECS instance is not in the Running state, Auto Scaling considers the instance unhealthy and automatically removes it from the scaling group.

- Auto Scaling stops and releases automatically created ECS instances.
- Auto Scaling does not stop or release manually added ECS instances.

4.1.3. Quick start

4.1.3.1. Overview

This topic describes how to get started with Auto Scaling.

You can perform the following steps to get started with Auto Scaling:

1. Create a scaling group

   Configure the parameters for the scaling group, such as Maximum Number of Instances and Minimum Number of Instances.

2. Create a scaling configuration

   Configure the parameters for the scaling configuration, such as Instance Type and Image.

3. Enable a scaling group

   Enable the scaling group for which the scaling configuration is enabled.

4. Create a scaling rule

   Add ECS instances to or remove ECS instances from the scaling group.

5. Create a scheduled task

Create scheduled tasks to add or remove instances at a specified point in time. Auto Scaling executes the scheduled tasks and scaling rules at the specified time. For example, Auto Scaling can trigger a task to execute a specified scaling rule at 08:00.

4.1.3.2. Log on to the Auto Scaling console

This topic describes how to log on to the Auto Scaling console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 8 to 20 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Login**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

5. In the top navigation bar, choose **Products > Elastic Computing > Auto Scaling**.

4.1.3.3. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of Elastic Compute Service (ECS) instances that are dynamically scaled based on the preconfigured rules. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see the "Create a VPC" and "Create a vSwitch" topics in *VPC User Guide*.
- To associate a scaling group with Server Load Balancer (SLB) instances, make sure that the following requirements are met:
  - You have one or more SLB instances in the **Running** state. For more information, see *Create an SLB instance* in *SLB User Guide*.
  - The SLB instances and the scaling group are in the same organization, resource set, and region.
  - If the network type is VPC, the SLB instances and the scaling group must be in the same VPC.
  - If the network type of the SLB instances is classic network, the network type of the scaling group is VPC, and the backend server groups of the SLB instances contain VPC-type ECS instances, the ECS instances and the scaling group must be in the same VPC.
  - At least one listener is configured for an SLB instance. For more information, see *Listener overview* in *SLB User Guide*.
  - The health check feature is enabled for the SLB instances. For more information, see *Configure health checks* in *SLB User Guide*.
- Before you associate ApsaraDB RDS instances with a scaling group, make sure that the following requirements are met:
  - You have one or more ApsaraDB RDS instances in the **Running** state. For more information, see *What is Apsara DB RDS?* in *ApsaraDB RDS Product Introduction*.
  - The ApsaraDB RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

1.
2.
3.
4. In the upper-right corner of the Scaling Groups page, click **Create Scaling Group**.
5. Configure the following parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). The name must start with a letter or a digit.
Organization/Resource Group	Yes	The organization and resource set to which the scaling group belongs.
Region	Yes	The ID of the region where the scaling group resides.
Maximum Number of Instances	Yes	The maximum number of instances that the scaling group can contain. To manage costs, specify a value based on your business requirements. Valid values: 0 to 1000.

Parameter	Required	Description
Minimum Number of Instances	Yes	The minimum number of instances that the scaling group must contain. To ensure service availability, specify a value based on your business requirements. When a scaling group is enabled, Auto Scaling automatically creates a certain number of ECS instances in the scaling group to maintain the minimum number. Valid values: 0 to 1000.
Cooldown Time (Seconds)	Yes	The period during which Auto Scaling cannot execute new scaling activities. The cooldown time occurs after Auto Scaling successfully executes a scaling activity. During the cooldown time, Auto Scaling rejects scaling requests triggered by event-triggered tasks from CloudMonitor. Scaling activities triggered by other types of tasks such as manually triggered tasks and scheduled tasks can be immediately executed. The value must be an integer that is greater than or equal to zero. Unit: seconds.
Scale-In Policy	No	The policy that is used to automatically remove the ECS instances from the scaling group. This parameter contains the **Filter First** and **Then Remove From Results** fields. You cannot specify the same values for the two fields. Valid values: ○ **Earliest Instance Created Using Scaling Configuration**: filters instances that are created based on the earliest scaling configuration. ○ **Earliest Created Instance**: filters instances that are added to the scaling group at the earliest point in time. ○ **Most Recently Created Instance**: filters instances that are added to the scaling group at the latest point in time ○ **None**: This value is available only for the **Then Remove From Results** field. This value specifies that Auto Scaling does not filter instances based on the Filter First field. For example, if Auto Scaling filters instances based on the **Earliest Created Instance** value of the Filter First field, you can select only one of the following values for the Then Remove From Results field: ○ **None**: specifies that Auto Scaling does not filter instances based on the Filter First field. ○ **Most Recently Created Instance**: filters instances that are most recently added to the scaling group from instances obtained based on the Filter First field.
VPC	Yes	The ID of the VPC to which the scaling group belongs.
vSwitch	Yes	The ID of the vSwitch with which the scaling group is associated.

Parameter	Required	Description
Associate SLB Instance	No	After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group are automatically added as the backend servers of the SLB instances. You can specify one of the following server groups for the ECS instances: ◦ Default server group: The group of ECS instances that are used to receive requests. If the listener is not configured with a vServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. ◦ vServer group: If you want to forward different requests to different backend servers or configure domain name- or URL-based routing methods, you can use vServer groups.
Associate RDS Instance	No	After you associate ApsaraDB RDS instances with the scaling group, the internal IP addresses of ECS instances in the scaling group are automatically added to the whitelists of the ApsaraDB RDS instances to allow mutual access between ECS instances and ApsaraDB RDS instances over the internal network.

6. Click **OK**.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. You need to create scaling configurations to enable the scaling group. For more information, see Create a scaling configuration.

4.1.3.4. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

A security group is available in the virtual private cloud (VPC) where the scaling group resides. For more information, see the *Create a security group* topic in *ECS User Guide*.

Context

A limited number of scaling configurations can be created in a scaling group. For more information, see the *Limits* topic in *Auto Scaling Product Introduction*.

Procedure

1.
2.
3.
4.
5.
6. Choose **Create > Create Scaling Configuration**.
7. Configure the following parameters for the scaling configuration.

Section	Parameter	Required	Description
Region	Region	Yes	The region where the Elastic Compute Service (ECS) instance is located.
	Zone	Yes	The zone where the ECS instance is located.
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	◦ **Public Image**: You can select public images provided by Alibaba Cloud. Public images are licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ **Custom Image**: You can create custom images that you can use to install software or deploy projects that have special requirements. ◦ **Shared Custom Image**: You can select a shared custom image.
Storage	System Disk (GB)	Yes	The type and size of the system disk. The operating system is installed on the system disk. You can select **Ultra Disk** or **Standard SSD**.
	Data Disk (GB)	No	The type and size of the data disk. You can select **Ultra Disk** or **Standard SSD**. You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can select **Release with Instance** and **Encrypt** for each data disk.
	Password Setting	Yes	Specifies when to set the password. You can select **Set Now** or **Set after Purchase**. If you set Password Setting to Set after Purchase, you need to reset the password in the console after the instance is created. For more information, see the "Change the logon password" topic in *ECS User Guide*.

Section	Parameter	Required	Description
Password	Logon Password	No	The password that is used to log on to the ECS instance. The password must be 8 to 30 characters in length and contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters. **Note** The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the logon password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Scaling Configuration	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.
User Data	User Data	No	The Windows operating system supports batch and PowerShell scripts. Before you perform Base64 encoding of user data, make sure that the first line of the data is included in `[bat]` or `[powershell]`. You can run shell scripts in the Linux operating system for ECS instances.
Quantity	Quantity	No	The number of instances that you want to create.

8. Click **Submit**.

Result

After the scaling configuration is created, the scaling configuration enters the **Disabled** state and is displayed in your scaling configuration list. To enable this scaling configuration, click Select in the Actions column. Then you can use scaling configuration when an ECS instance is created. For more information, see Apply a scaling configuration.

4.1.3.5. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enabled** state.

Procedure

1.

2.
3.
4. Find the scaling group that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The state of the scaling group is changed from **Disabled** to **Enabled** in the **Status** column.

4.1.3.6. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove Elastic Compute Service (ECS) instances. For example, you can add an ECS instance to a scaling group.

Context

- A limited number of scaling rules can be created in a scaling group. For more information, see the "Limits" topic in *Auto Scaling Product Introduction*.
- After a scaling rule is executed, the remaining number of ECS instances in the scaling group may be outside the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1.
2.
3.
4.
5.
6. Choose **Create > Create Scaling Rule**.
7. Configure the following parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). The name must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: ○ **Change to N Units**: When the scaling rule is executed, the number of instances in the scaling group is changed to N. ○ **Add N Units**: When the scaling rule is executed, N instances are added to the scaling group. ○ **Remove N Units**: When the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not configured, the default value is used.

8. In the message that appears, click **OK**.

4.1.3.7. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the business peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and meet business requirements. You can also specify recurring schedules for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in 1 minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1.
2.
3.
4. In the upper-right corner of the Scheduled Tasks page, click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set in which to create the scheduled task.
Start Time	Yes	The time to execute the scheduled task.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Interval (Seconds)	No	The period of time during which the system retires to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling executes the scheduled task again within the period of time that is specified by the Retry Interval (Seconds) parameter.
Recurrence Settings (Advanced)	No	Specifies whether to execute the scheduled task on a recurring schedule. Select **Recurrence Settings (Advanced)** and set the Recurrence and Expire parameters. The valid values for Recurrence include **Daily**, **Weekly**, and **Monthly**.

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.1.3.8. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time and triggers an alert when the specified condition is met. Then, Auto Scaling executes the corresponding scaling rule to scale Elastic Compute Service (ECS) instances in the scaling group.

Procedure

1.
2.
3.
4. In the upper-right corner of the Event-Triggered Tasks page, click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rule	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	**System-Level Monitoring** is selected by default.
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: ○ **Average CPU Utilization** ○ **Memory Usage** ○ **Outbound Traffic** ○ **Inbound Traffic** ○ **Average System Load**
Monitoring Period	Yes	The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values: ○ 1 ○ 2 ○ 5 ○ 15

Parameter	Required	Description
Statistic	Yes	The rule that determines whether to trigger an alert. Select **Average**, **Max Capacity**, or **Min Capacity**, and specify a threshold value. For example, to trigger an alert when the CPU utilization exceeds 80%, you can use one of the following methods to specify the trigger condition: ○ Average: An alert is triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ○ Max Capacity: An alert is triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ○ Min Capacity: An alert is triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Trigger After	Yes	The number of consecutive times that the threshold must be exceeded before the alert is triggered. Valid values: ○ 1 ○ 2 ○ 3 ○ 5

6. Click **OK**.

4.1.4. Scaling groups

4.1.4.1. Create a scaling group

This topic describes how to create a scaling group. A scaling group is a group of Elastic Compute Service (ECS) instances that are dynamically scaled based on the preconfigured rules. You can specify the minimum and maximum numbers of ECS instances in a scaling group.

Prerequisites

- A virtual private cloud (VPC) and a vSwitch are created. For more information, see the "Create a VPC" and "Create a vSwitch" topics in *VPC User Guide*.
- To associate a scaling group with Server Load Balancer (SLB) instances, make sure that the following requirements are met:
  - You have one or more SLB instances in the **Running** state. For more information, see *Create an SLB instance* in *SLB User Guide*.
  - The SLB instances and the scaling group are in the same organization, resource set, and region.
  - If the network type is VPC, the SLB instances and the scaling group must be in the same VPC.
  - If the network type of the SLB instances is classic network, the network type of the scaling group is VPC, and the backend server groups of the SLB instances contain VPC-type ECS instances, the ECS instances and the scaling group must be in the same VPC.
  - At least one listener is configured for an SLB instance. For more information, see *Listener overview* in *SLB User Guide*.
  - The health check feature is enabled for the SLB instances. For more information, see *Configure health checks* in *SLB User Guide*.
- Before you associate ApsaraDB RDS instances with a scaling group, make sure that the following requirements are met:

- You have one or more ApsaraDB RDS instances in the **Running** state. For more information, see *What is Apsara DB RDS?* in *ApsaraDB RDS Product Introduction*.
- The ApsaraDB RDS instances and the scaling group are in the same organization, resource set, and region.

Procedure

1.
2.
3.
4. In the upper-right corner of the Scaling Groups page, click **Create Scaling Group**.
5. Configure the following parameters for the scaling group.

Parameter	Required	Description
Scaling Group	Yes	The name of the scaling group. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). The name must start with a letter or a digit.
Organization/Resource Group	Yes	The organization and resource set to which the scaling group belongs.
Region	Yes	The ID of the region where the scaling group resides.
Maximum Number of Instances	Yes	The maximum number of instances that the scaling group can contain. To manage costs, specify a value based on your business requirements. Valid values: 0 to 1000.
Minimum Number of Instances	Yes	The minimum number of instances that the scaling group must contain. To ensure service availability, specify a value based on your business requirements. When a scaling group is enabled, Auto Scaling automatically creates a certain number of ECS instances in the scaling group to maintain the minimum number. Valid values: 0 to 1000.
Cooldown Time (Seconds)	Yes	The period during which Auto Scaling cannot execute new scaling activities. The cooldown time occurs after Auto Scaling successfully executes a scaling activity. During the cooldown time, Auto Scaling rejects scaling requests triggered by event-triggered tasks from CloudMonitor. Scaling activities triggered by other types of tasks such as manually triggered tasks and scheduled tasks can be immediately executed. The value must be an integer that is greater than or equal to zero. Unit: seconds.

Parameter	Required	Description
Scale-In Policy	No	The policy that is used to automatically remove the ECS instances from the scaling group. This parameter contains the **Filter First** and **Then Remove From Results** fields. You cannot specify the same values for the two fields. Valid values: ◦ **Earliest Instance Created Using Scaling Configuration**: filters instances that are created based on the earliest scaling configuration. ◦ **Earliest Created Instance**: filters instances that are added to the scaling group at the earliest point in time. ◦ **Most Recently Created Instance**: filters instances that are added to the scaling group at the latest point in time ◦ **None**: This value is available only for the **Then Remove From Results** field. This value specifies that Auto Scaling does not filter instances based on the Filter First field. For example, if Auto Scaling filters instances based on the **Earliest Created Instance** value of the Filter First field, you can select only one of the following values for the Then Remove From Results field: ◦ **None**: specifies that Auto Scaling does not filter instances based on the Filter First field. ◦ **Most Recently Created Instance**: filters instances that are most recently added to the scaling group from instances obtained based on the Filter First field.
VPC	Yes	The ID of the VPC to which the scaling group belongs.
vSwitch	Yes	The ID of the vSwitch with which the scaling group is associated.
Associate SLB Instance	No	After you associate SLB instances with the scaling group, ECS instances that are added to the scaling group are automatically added as the backend servers of the SLB instances. You can specify one of the following server groups for the ECS instances: ◦ Default server group: The group of ECS instances that are used to receive requests. If the listener is not configured with a vServer group or a primary/secondary server group, requests are forwarded to the ECS instances in the default server group. ◦ vServer group: If you want to forward different requests to different backend servers or configure domain name- or URL-based routing methods, you can use vServer groups.
Associate RDS Instance	No	After you associate ApsaraDB RDS instances with the scaling group, the internal IP addresses of ECS instances in the scaling group are automatically added to the whitelists of the ApsaraDB RDS instances to allow mutual access between ECS instances and ApsaraDB RDS instances over the internal network.

6. Click **OK**.

Result

The created scaling group is displayed in the scaling group list but is in the **Disabled** state. You need to create scaling configurations to enable the scaling group. For more information, see Create a scaling configuration.

4.1.4.2. Enable a scaling group

This topic describes how to enable a scaling group. You can enable a scaling group to trigger scaling activities.

Prerequisites

- The scaling group is in the **Disabled** state.
- The scaling group has a scaling configuration that is in the **Enabled** state.

Procedure

1.
2.
3.
4. Find the scaling group that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The state of the scaling group is changed from **Disabled** to **Enabled** in the **Status** column.

4.1.4.3. Query scaling groups

This topic describes how to query scaling groups and view the details about a scaling group.

Procedure

1.
2.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that belong to the specified organization, resource set, and region are displayed.
4. Select a filter option, enter the information about a scaling group, and then click **Search**.

   You can select multiple filter options to search for scaling groups.

Filter option	Description
Scaling Group Name	Enter the name of the scaling group that you want to search for.
Scaling Group ID	Enter the ID of the scaling group that you want to search for.

5. Click the name of the scaling group in the **Scaling Group Name/ID** column.
6. View the details about the scaling group.

Page	Description
Basic Information	The configuration information about the scaling group, including the scaling group ID, scaling group name, total instances, minimum number of instances, maximum number of instances, and scale-in policy.

Page	Description
ECS Instances	The details about the ECS instances, including the list of automatically created ECS instances, the list of manually added ECS instances, and the number of ECS instances that are in service.
Scaling Activities	The scaling activities that were executed in the scaling group.
Scaling Configuration	The information about the scaling configuration in the scaling group.
Scaling Rules	The information about the scaling rules.

4.1.4.4. Edit a scaling group

This topic describes how to edit a scaling group. You can edit the parameter settings of a specified scaling group, including the minimum and maximum numbers of ECS instances.

Context

After you change the minimum or maximum number of ECS instances in a scaling group, Auto Scaling automatically creates or removes ECS instances to maintain the number of instances within the valid range.

Procedure

1.
2.
3.
4. Find the scaling group that you want to edit and click **Edit** in the **Actions** column.
5. Edit the parameter settings of the scaling group.

   You can edit only the scaling configuration and other parameters. You cannot change the organization and resource set. For more information about other parameters, see Create a scaling group.
6. Click **OK**.

4.1.4.5. Disable a scaling group

This topic describes how to disable a scaling group.

Prerequisites

- Make sure that the scaling group that you want to disable does not have any scaling activities in progress.
- The scaling group is in the **Enabled** state.

Procedure

1.
2.
3.
4. Find the scaling group that you want to disable and click **Disable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The state of the scaling group is changed from **Enabled** to **Disabled** in the **Status** column.

4.1.4.6. Delete a scaling group

This topic describes how to delete a scaling group. When you delete a scaling group, Auto Scaling removes and releases ECS instances that are automatically created, removes ECS instances that are manually added, and deletes the scaling configurations and rules in the scaling group. However, Auto Scaling does not delete the scheduled tasks and event-triggered tasks that are associated with the scaling group.

Procedure

1.
2.
3.
4. Find the scaling group that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

4.1.4.7. Query ECS instances

You can query all ECS instances in a scaling group and their states.

Procedure

1.
2.
3.
4.
5.
6. View the details of ECS instances.

Category	Description
Automatically created ECS instances	The ECS instances that are automatically created based on the active scaling configuration when a scaling rule is triggered.
Manually added ECS instances	The ECS instances that are manually added to the specified scaling group.
The number of ECS instances in each state.	The following section describes the states: ○ Total: all ECS instances in the scaling group ○ In Service: the ECS instances that are in normal use ○ On Standby: the ECS instances that are on standby ○ Protected: the ECS instances that are protected ○ Adding: the ECS instances that are being added to the scaling group ○ Removing: the ECS instances that are being removed from the scaling group **Note** The Disabled, Adding:wait, and Suspending states are unavailable.

4.1.4.8. Switch an ECS instance to the Standby state

This topic describes how to switch an ECS instance to the Standby state. Auto Scaling does not perform health checks on or release ECS instances that are in the Standby state.

Context

The following items describe an ECS instance that is switched to the Standby state:

- The ECS instance remains in the Standby state until you manually remove it from the Standby state.
- Auto Scaling stops managing the lifecycle of the ECS instance. You must manually manage the lifecycle of the ECS instance.
- If a scale-in activity is triggered, Auto Scaling does not remove the ECS instance.
- When the ECS instance is stopped or restarted, the health check status of the ECS instance remains unchanged.
- To release the ECS instance, you must first remove it from the scaling group.
- If you delete the scaling group, the ECS instance is automatically removed from the Standby state and is released.
- You can also perform other operations on the ECS instance, such as stop, restart, change the instance type of, or change the operating system of the ECS instance.

Procedure

1.
2.
3.
4.
5.
6.
7. Find the ECS instance that you want to switch to the Standby state and choose **Actions > Switch to Standby** in the **Actions** column.
8. In the message that appears, click **OK**.

4.1.4.9. Remove an ECS instance from the Standby state

This topic describes how to remove an ECS instance from the Standby state. You can reuse instances that are removed from the Standby state.

Context

The following items describe an ECS instance that is removed from the Standby state:

- The ECS instance enters the In Service state.
- When the ECS instance is stopped or restarted, its health status is updated.
- Auto Scaling continues to manage the lifecycle of the ECS instance, and can remove the ECS instance from the scaling group during a scaling activity.

Procedure

1.
2.
3.
4.
5.

6.
7. Find the ECS instance that you want to remove from the Standby state and choose **Actions > Move Out Of Standby** in the **Actions** column.
8. In the message that appears, click **OK**.

4.1.4.10. Switch an ECS instance to the Protected state

This topic describes how to switch an ECS instance to the Protected state. Auto Scaling does not perform health checks on or release ECS instances that are in the Protected state.

Context

The following items describe an ECS instance that is switched to the Protected state:

- The ECS instance remains in the Protected state until you manually remove it from the Protected state.
- If a scale-in activity is triggered, Auto Scaling does not remove the ECS instance. To release the ECS instance, you must remove the ECS instance from the Protected state and then remove it from the scaling group.
- When the ECS instance is stopped or restarted, the health check status of the ECS instance remains unchanged.

Procedure

1.
2.
3.
4.
5.
6.
7. Find the ECS instance that you want to switch to the Protected state and choose **Actions > Switch to Protected** in the **Actions** column.
8. In the message that appears, click **OK**.

4.1.4.11. Remove an ECS instance from the Protected state

This topic describes how to remove an ECS instance from the Protected state. After an ECS instance is removed from the Protected state, Auto Scaling continues to manage the lifecycle of the ECS instance.

Procedure

1.
2.
3.
4.
5.
6.
7. Find the ECS instance that you want to remove from the Protected state and choose **Actions > Move Out Of Protection** in the **Actions** column.
8. In the message that appears, click **OK**.

4.1.5. Scaling configurations

4.1.5.1. Create a scaling configuration

This topic describes how to create a scaling configuration for a scaling group.

Prerequisites

A security group is available in the virtual private cloud (VPC) where the scaling group resides. For more information, see the *Create a security group* topic in *ECS User Guide*.

Context

A limited number of scaling configurations can be created in a scaling group. For more information, see the *Limits* topic in *Auto Scaling Product Introduction*.

Procedure

1.
2.
3.
4.
5.
6. Choose **Create > Create Scaling Configuration**.
7. Configure the following parameters for the scaling configuration.

Section	Parameter	Required	Description
Region	Region	Yes	The region where the Elastic Compute Service (ECS) instance is located.
	Zone	Yes	The zone where the ECS instance is located.
Security Group	Security Group	Yes	The security group to which the ECS instance belongs.
Instance	Instance Type	Yes	The instance type of the ECS instance.
Image	Image Type	Yes	◦ **Public Image**: You can select public images provided by Alibaba Cloud. Public images are licensed to offer a secure and stable operating environment for applications on ECS instances. ◦ **Custom Image**: You can create custom images that you can use to install software or deploy projects that have special requirements. ◦ **Shared Custom Image**: You can select a shared custom image.

Section	Parameter	Required	Description
Storage	System Disk (GB)	Yes	The type and size of the system disk. The operating system is installed on the system disk. You can select **Ultra Disk** or **Standard SSD**.
	Data Disk (GB)	No	The type and size of the data disk. You can select **Ultra Disk** or **Standard SSD**. You can add a maximum of 16 data disks. The maximum capacity of each data disk is 32 TiB. You can select **Release with Instance** and **Encrypt** for each data disk.
Password	Password Setting	Yes	Specifies when to set the password. You can select **Set Now** or **Set after Purchase**. If you set Password Setting to Set after Purchase, you need to reset the password in the console after the instance is created. For more information, see the "Change the logon password" topic in *ECS User Guide*.
	Logon Password	No	The password that is used to log on to the ECS instance. The password must be 8 to 30 characters in length and contain at least three of the following character types: digits, uppercase letters, lowercase letters, and special characters. **Note** The password is used to log on to the operating system and is not the VNC password.
	Confirm Password	No	Enter the logon password again.
Deployment Set	Deployment Set	No	The deployment set to which the instance belongs.
Instance Name	Scaling Configuration	No	The name of the scaling configuration.
	Instance Name	No	The name of the ECS instance.

Section	Parameter	Required	Description
User Data	User Data	No	The Windows operating system supports batch and PowerShell scripts. Before you perform Base64 encoding of user data, make sure that the first line of the data is included in `[bat]` or `[powershell]`. You can run shell scripts in the Linux operating system for ECS instances.
Quantity	Quantity	No	The number of instances that you want to create.

8. Click **Submit**.

Result

After the scaling configuration is created, the scaling configuration enters the **Disabled** state and is displayed in your scaling configuration list. To enable this scaling configuration, click Select in the Actions column. Then you can use scaling configuration when an ECS instance is created. For more information, see Apply a scaling configuration.

4.1.5.2. View scaling configurations

This topic describes how to view scaling configurations.

Procedure

1.
2.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that belong to the specified organization, resource set, and region are displayed.
4.
5.
6. View the scaling configurations.

4.1.5.3. Modify a scaling configuration

This topic describes how to modify a scaling configuration. You can modify the parameter settings of a scaling configuration based on your business requirements.

Procedure

1.
2.
3.
4.
5.
6. Find the scaling configuration that you want to modify and click its name in the **Scaling Configuration Name/ID** column.
7. Modify the parameter settings of the scaling configuration.

   For more information about the parameters of the scaling configuration, see Create a scaling configuration.
8. Click **OK**.

4.1.5.4. Apply a scaling configuration

This topic describes how to apply a scaling configuration. You can create multiple scaling configurations for a scaling group and apply one of the scaling configurations based on your business requirements.

Procedure

1.
2.
3.
4.
5.
6. Find the scaling configuration that you want to apply and click **Apply** in the **Actions** column.

   Only one scaling configuration can be in the **Enabled** state in a scaling group. After a scaling configuration is applied, other scaling configurations are switched to the **Disabled** state.
7. Click **OK**.

Result

The state of the scaling configuration is changed from **Disabled** to **Enabled** in the **Status** column.

4.1.5.5. Delete a scaling configuration

This topic describes how to delete a scaling configuration that you no longer use. After you delete a scaling configuration, the ECS instances that are created from the scaling configuration are not released.

Prerequisites

The scaling configuration is in the **Disabled** state.

Procedure

1.
2.
3.
4.
5.
6. Find the scaling configuration that you want to delete and click **Select Delete** in the **Actions** column.
7. In the message that appears, click **OK**.

4.1.6. Scaling rules

4.1.6.1. Create a scaling rule

This topic describes how to create a scaling rule. You can create scaling rules to add or remove Elastic Compute Service (ECS) instances. For example, you can add an ECS instance to a scaling group.

Context

- A limited number of scaling rules can be created in a scaling group. For more information, see the "Limits" topic in *Auto Scaling Product Introduction*.
- After a scaling rule is executed, the remaining number of ECS instances in the scaling group may be outside the specified range. In this case, Auto Scaling automatically adjusts the number of ECS instances to ensure that the number of ECS instances in the scaling group is within the specified range.

Procedure

1.
2.
3.
4.
5.
6. Choose **Create > Create Scaling Rule**.
7. Configure the following parameters for the scaling rule.

Parameter	Required	Description
Rule Name	Yes	The name of the scaling rule. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). The name must start with a letter or digit.
Scaling Activity	Yes	The operation that is performed when the scaling rule is triggered. The operations include: ○ **Change to N Units**: When the scaling rule is executed, the number of instances in the scaling group is changed to N. ○ **Add N Units**: When the scaling rule is executed, N instances are added to the scaling group. ○ **Remove N Units**: When the scaling rule is executed, N instances are removed from the scaling group.
Default Cooldown (Seconds)	No	The cooldown period. If this parameter is not configured, the default value is used.

8. In the message that appears, click **OK**.

4.1.6.2. View scaling rules

This topic describes how to view scaling rules.

Procedure

1.
2.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The scaling groups that belong to the specified organization, resource set, and region are displayed.
4.
5.
6. View scaling rules.

4.1.6.3. Modify a scaling rule

This topic describes how to modify a scaling rule. You can modify the settings of the following parameters of a scaling rule: Rule Name, Scaling Activity, and Default Cooldown (Seconds).

Procedure

1.
2.
3.
4.
5.
6. Find the scaling rule that you want to modify and click **Edit** in the **Actions** column.
7. Modify the Rule Name, Scaling Activity, and Default Cooldown (Seconds) parameters based on your business requirements.
8. Click **OK**.

4.1.6.4. Delete a scaling rule

This topic describes how to delete a scaling rule that you no longer use.

Procedure

1.
2.
3.
4.
5.
6. Find the scaling rule that you want to delete and click **Delete** in the **Actions** column.
7. In the message that appears, click **OK**.

4.1.7. Scaling tasks

4.1.7.1. Manually execute a scaling rule

This topic describes how to manually execute a scaling rule to add or remove ECS instances.

Prerequisites

- The scaling group for which the scaling rule is created is in the **Enabled** state.
- No scaling activity is in progress in the scaling group for which the scaling rule is created.

Context

After the scaling rule is executed, Auto Scaling automatically adds or removes ECS instances to maintain the number of ECS instances based on the specified maximum and minimum number.

Auto Scaling allows you to manually execute scaling rules. You can also associate scaling rules with scaling tasks when you create scheduled tasks or event-triggered tasks to enable auto scaling. For more information, see Create a scheduled task and Create an event-triggered task.

Procedure

1.
2.
3.
4.
5.
6. Find the scaling rule that you want to execute and click **Run** in the **Actions** column.

7. In the message that appears, click **OK**.

Result

The **Scaling Activities** page appears. You can view the details about your scaling activities.

4.1.7.2. Manually add an ECS instance to a scaling group

This topic describes how to manually add an ECS instance to a scaling group. You can add existing ECS instances to a scaling group to maximize the use of compute resources.

Prerequisites

The ECS instance that you want to add must meet the following conditions:

- The ECS instance and the scaling group to which you want to add the ECS instance share the same region, organization, and resource set.
- The ECS instance is in the **Running** state.
- The ECS instance does not belong to another scaling group.
- The ECS instance and the scaling group are in the same virtual private cloud (VPC).

The scaling group to which you want to add the ECS instance must meet the following conditions:

- The scaling group is in the **Enabled** state.
- No scaling activity is in progress in the scaling group.

Context

- You can manually remove an ECS instance from a scaling group without the need to wait for the cooldown period to expire.
- After the ECS instance is added to a scaling group, the number of instances in the scaling group must be less than or equal to the maximum number of instances. Otherwise, the ECS instance cannot be added.
- The ECS instances that are manually added to a scaling group are not limited by the scaling configurations. The instance types of the manually added instances can be different from the instance type of the scaling configuration that is in the **Enabled** state.

Procedure

1.
2.
3.
4.
5.
6. Click **Add Instance**.
7. Select the ECS instance that you want to add to the scaling group and click **OK**.

Result

The manually added instance is displayed on the **Manually Added** tab.

4.1.7.3. Manually remove an ECS instance

This topic describes how to manually remove an ECS instance that you no longer use from a scaling group.

Prerequisites

The scaling group from which you want to remove the ECS instance must meet the following conditions:

- The scaling group is in the **Enabled** state.

- No scaling activity is in progress in the scaling group.

Context

- You can manually remove the ECS instance from a scaling group without the need to wait for the cooldown period to expire.
- After the ECS instance is removed from a scaling group, the number of instances in the scaling group must be greater than or equal to the minimum number of instances. Otherwise, the ECS instance cannot be removed.

Procedure

1.
2.
3.
4.
5.
6.
7. Select a method to remove the ECS instance.

   Manually added ECS instances can only be removed, but cannot be released.

   - Find the ECS instance that you want to remove from the scaling group and choose **Actions > Remove from Scaling Group** in the **Actions** column.
   - Find the ECS instance that you want to remove and release, and choose **Actions > Remove from Scaling Group and Release** in the **Actions** column.
8. In the message that appears, click **OK**.

4.1.8. Scheduled tasks

4.1.8.1. Create a scheduled task

This topic describes how to create a scheduled task to scale computing resources in response to predictable business changes in the future. Scheduled tasks enable the system to automatically obtain sufficient computing resources before business peaks and release idle computing resources after the business peaks.

Context

A scheduled task is preconfigured to execute the specified scaling rule at the specified time. When the specified time arrives, the scheduled task automatically scales computing resources. This allows you to reduce costs and meet business requirements. You can also specify recurring schedules for scheduled tasks if business changes are regular.

If multiple scheduled tasks need to be executed in 1 minute, Auto Scaling executes the most recently created scheduled task.

Procedure

1.
2.
3.
4. In the upper-right corner of the Scheduled Tasks page, click **Create Scheduled Task**.
5. In the dialog box that appears, configure parameters for the scheduled task.

Parameter	Required	Description

Parameter	Required	Description
Task Name	Yes	The name of the scheduled task. The name must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	Yes	The description of the scheduled task.
Organization/Resource Group	Yes	The organization and resource set in which to create the scheduled task.
Start Time	Yes	The time to execute the scheduled task.
Scaling Rules	Yes	The scaling group to be monitored and the scaling rule to be executed.
Retry Interval (Seconds)	No	The period of time during which the system retires to execute the scheduled task. Unit: seconds. If a scaling activity fails to be executed at the specified time, Auto Scaling executes the scheduled task again within the period of time that is specified by the Retry Interval (Seconds) parameter.
Recurrence Settings (Advanced)	No	Specifies whether to execute the scheduled task on a recurring schedule. Select **Recurrence Settings (Advanced)** and set the Recurrence and Expire parameters. The valid values for Recurrence include **Daily**, **Weekly**, and **Monthly**.

6. Click **OK**.

Result

The scheduled task that you created is displayed in the scheduled task list.

4.1.8.2. View scheduled tasks

This topic describes how to view scheduled tasks.

Procedure

1.
2.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The scheduled tasks that correspond to the specified organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

   You can select multiple filter options to narrow down the search results.

Option	Description
Task Name	Enter a task name to search for the scheduled task.
Task ID	Enter a task ID to search for the scheduled task.

5. View the scheduled task list.

4.1.8.3. Modify a scheduled task

This topic describes how to modify a scheduled task. You can modify parameters such as Start Time, Scaling Rules, and Retry Expiry Time for a scheduled task.

Procedure

1.
2.
3.
4. Find the scheduled task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the scheduled task.

   You can modify the Recurrence and Expire parameters if you have enabled the Recurrence Settings (Advanced) feature when you create the scheduled task, but the Recurrence Settings (Advanced) feature cannot be disabled. For more information about other parameters of the scheduled task, see Create a scheduled task.
6. Click **OK**.

4.1.8.4. Disable a scheduled task

This topic describes how to disable a scheduled task. You can disable a scheduled task that is no longer needed.

Prerequisites

The scheduled task is in the **Running** state.

Procedure

1.
2.
3.
4. Find the scheduled task that you want to disable and click **Disabled** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task is changed from **Running** to **Stop** in the **Status** column.

4.1.8.5. Enable a scheduled task

This topic describes how to enable a scheduled task. You can enable a scheduled task that has been disabled and use it to trigger scaling activities at the specified time point.

Prerequisites

The scheduled task is in the **Stop** state.

Procedure

1.
2.
3.
4. Find the scheduled task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the scheduled task is changed from **Stop** to **Running** in the **Status** column.

4.1.8.6. Delete a scheduled task

This topic describes how to delete a scheduled task that is no longer needed.

Procedure

1.
2.
3.
4. Find the scheduled task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

4.1.9. Event-triggered tasks

4.1.9.1. Create an event-triggered task

This topic describes how to create an event-triggered task associated with monitoring metrics in response to emergent or unpredictable business changes. After you create and enable an event-triggered task, Auto Scaling collects data for the specified metric in real time and triggers an alert when the specified condition is met. Then, Auto Scaling executes the corresponding scaling rule to scale Elastic Compute Service (ECS) instances in the scaling group.

Procedure

1.
2.
3.
4. In the upper-right corner of the Event-Triggered Tasks page, click **Create Alert**.
5. In the dialog box that appears, configure parameters for the event-triggered task.

Parameter	Required	Description
Task Name	Yes	The name of the event-triggered task. It must be 2 to 64 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or a digit.
Description	No	The description of the event-triggered task.
Organization/Resource Group	Yes	The organization and resource set in which to create the event-triggered task.
Monitoring Metrics/Scaling Rule	Yes	The scaling group to be monitored and the scaling rule to be executed.
Monitoring Type	Yes	**System-Level Monitoring** is selected by default.
Monitoring Metrics	Yes	The metrics that you want to monitor. Valid values: ○ **Average CPU Utilization** ○ **Memory Usage** ○ **Outbound Traffic** ○ **Inbound Traffic** ○ **Average System Load**

Parameter	Required	Description
Monitoring Period	Yes	The period during which data is aggregated and analyzed. The shorter the period, the higher the frequency that the alert is triggered. Unit: minutes. Valid values: ○ 1 ○ 2 ○ 5 ○ 15
Statistic	Yes	The rule that determines whether to trigger an alert. Select **Average**, **Max Capacity**, or **Min Capacity**, and specify a threshold value. For example, to trigger an alert when the CPU utilization exceeds 80%, you can use one of the following methods to specify the trigger condition: ○ Average: An alert is triggered when the average CPU utilization of all ECS instances in the scaling group exceeds 80%. ○ Max Capacity: An alert is triggered when the highest CPU utilization among the ECS instances in the scaling group exceeds 80%. ○ Min Capacity: An alert is triggered when the lowest CPU utilization among the ECS instances in the scaling group exceeds 80%.
Trigger After	Yes	The number of consecutive times that the threshold must be exceeded before the alert is triggered. Valid values: ○ 1 ○ 2 ○ 3 ○ 5

6. Click **OK**.

4.1.9.2. View event-triggered tasks

This topic describes how to view event-triggered tasks.

Procedure

1.
2.
3. In the top navigation bar, select an organization, a resource set, and a region.
   The event-triggered tasks that correspond to the specific organization, resource set, and region are displayed.
4. Select a filter option, enter the corresponding information, and then click **Search**.

   You can select multiple filter options to narrow down the search results.

Option	Description
Alert Name	Enter an event-triggered task name to search for the event-triggered task.
Scaling Group ID	Enter a scaling group ID to search for the event-triggered task associated with the scaling group.

4.1.9.3. Modify an event-triggered task

This topic describes how to modify an event-triggered task. You can modify parameters such as Scaling Rules, Monitoring Type, and Statistic for an event-triggered task.

Procedure

1.
2.
3.
4. Find the event-triggered task that you want to modify and click **Edit** in the **Actions** column.
5. Modify the parameters of the event-triggered task.

   For more information about other parameters of the scheduled task, see Create an event-triggered task. The following parameters cannot be modified:

   - Organization
   - Resource Group
   - Monitoring Metrics
   - Monitoring Period
6. Click **OK**.

4.1.9.4. Disable an event-triggered task

This topic describes how to disable an event-triggered task. You can disable an event-triggered task if you no longer want to use it to trigger scaling activities.

Prerequisites

The event-triggered task is in the **Normal**, **Alerts**, or **Insufficient Data** state.

Procedure

1.
2.
3.
4. Find the event-triggered task that you want to disable and click **Disable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task is changed to **Stopped** in the **Status** column.

4.1.9.5. Enable an event-triggered task

This topic describes how to enable an event-triggered task. You can enable an event-triggered task that has been disabled to continue to monitor metrics and trigger scaling activities for a scaling group.

Prerequisites

The event-triggered task is in the **Stopped** state.

Procedure

1.
2.

3.
4. Find the event-triggered task that you want to enable and click **Enable** in the **Actions** column.
5. In the message that appears, click **OK**.

Result

The status of the event-triggered task changes from **Stopped** to **Normal** in the **Status** column.

4.1.9.6. Delete an event-triggered task

This topic describes how to delete an event-triggered task. You can delete an event-triggered task that is no longer needed.

Procedure

1.
2.
3.
4. Find the event-triggered task that you want to delete and click **Delete** in the **Actions** column.
5. In the message that appears, click **OK**.

5.Resource Orchestration Service (ROS)

5.1. User Guide

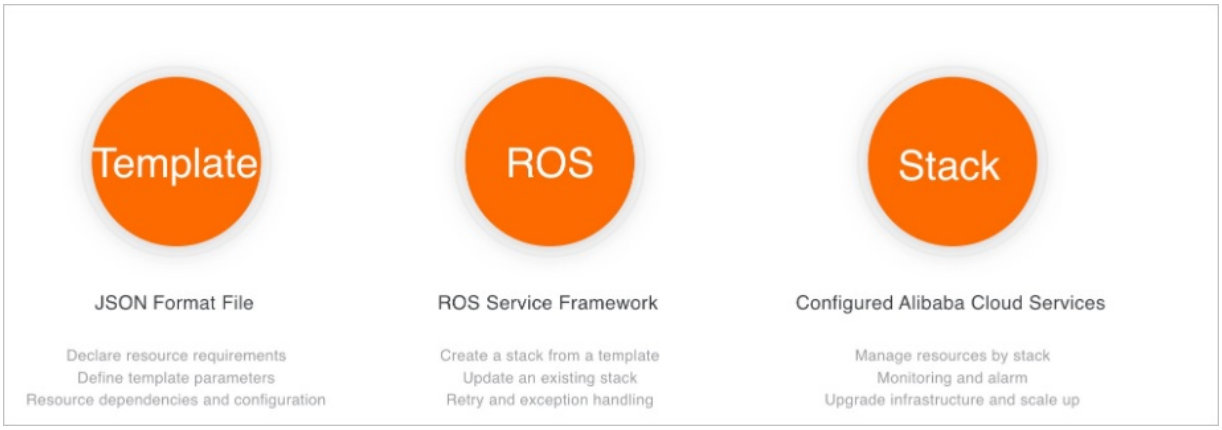
5.1.1. What is ROS?

Resource Orchestration Service (ROS) is an Apsara Stack service that can simplify the management of cloud computing resources. You can create stack templates based on the template specifications defined in ROS. Within a template, you can define cloud computing resources such as Elastic Compute Service (ECS) and ApsaraDB RDS instances, and the dependencies between resources. The ROS engine automatically creates and configures all resources in a stack based on a template, which makes automatic deployment and O&M possible.

An ROS template is a readable, easy-to-create text file. You can directly edit a JSON template or use version control tools such as Apache Subversion (SVN) and Git to manage the template and infrastructure versions. You can use APIs and SDKs to integrate the orchestration capabilities of ROS with your own applications to implement Infrastructure as Code (IaC).

ROS templates are also a standardized way to deliver resources and applications. If you are an independent software vendor (ISV), you can use ROS templates to deliver a holistic system or solution that encompasses cloud resources and applications. ISVs can use this method to integrate Apsara Stack resources with their own software systems for centralized delivery.

ROS manages a group of cloud resources as a single unit called stack. A stack is a group of Apsara Stack resources. You can create, delete, and clone cloud resources by stack.



5.1.2. Log on to the ROS console

This topic describes how to log on to the Resource Orchestration Service (ROS) console.

Prerequisites

- The URL, username, and password of the Apsara Uni-manager Management Console are obtained from the operations administrator before you log on.
- A browser is available. We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter the correct username and password.

The first time you log on to the Apsara Uni-manager Management Console, you must change the password of your Apsara Stack tenant account. For security purposes, your password must meet the minimum complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:

- Uppercase and lowercase letters
- Digits
- Special characters including exclamation points (!), at signs (@), number signs (#), dollar signs ($), and percent signs (%)

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.
5. In the top navigation bar, choose **Products > Elastic Computing > Resource Orchestration Service**.

5.1.3. Manage stacks

5.1.3.1. Create a stack

Resource Orchestration Service (ROS) allows you to use a template to create a group of Apsara Stack resources. This topic describes how to create a stack.

Method 1: (Recommended) Use the Stacks page

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **Stacks**.
3. On the **Stacks** page, click **Create Stack**.
4. In the **Select Template** step, configure **Organization**, **Resource Set**, and **regionId**.
5. Select a value for Specify Template Import Method. Enter the content of your template in the Prepare Template section. Then, click **Next**.
   - **Enter Template Content**: Enter the content of a JSON template in the **Prepare Template** section.
   - **My Templates**: Select an existing template. For more information about how to create a template, see Create a template.
6. In the **Configure Template Parameters** step, configure parameters in the Stacks and Set Parameters sections. Then, click **Next**.

   > **Note** The parameters that you need to configure vary based on the templates. Configure the parameters as instructed in the ROS console.
7. In the **Configure Stack** step, configure Rollback on Failure and Timeout Period. Then, click **Next**.
8. In the **Confirm** step, check the template and stack configurations, and click **Create Stack**.

After the stack is created, the state of the stack is **Created**. You can click the ID of the stack to go to the following tabs: Stack Information, Events, Resources, Outputs, Parameters, and Template.

Method 2: Use an existing template

If you have an existing template, you can perform the following steps to create a stack. For more information about how to create a template, see Create a template.

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **My Templates**.
3. On the **My Templates** page, find the template that you want to use and click **Create** in the **Actions** column.
4. In the **Select Template** step, configure **Organization**, **Resource Set**, and **regionId**. Then, click **Next**.
5. In the **Configure Template Parameters** step, configure parameters in the Stacks and Set Parameters sections. Then, click **Next**.
6. In the **Configure Stack** step, configure Rollback on Failure and Timeout Period. Then, click **Next**.
7. In the **Confirm** step, check the template and stack configurations, and click **Create Stack**.

   After the stack is created, the state of the stack is **Created**. You can click the ID of the stack to go to the following tabs: Stack Information, Events, Resources, Outputs, Parameters, and Template.

5.1.3.2. Update a stack

You can update a stack if you want to modify only the template that is used to create the stack or the stack configurations. The update operation does not change the organization, resource set, or region ID of your stack. This topic describes how to update a stack.

Prerequisites

A stack is created. For more information, see Create a stack.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **Stacks**.
3. On the **Stacks** page, find the stack that you want to update and click **Update** in the **Actions** column.
4. In the **Select Template** step, select a value for Specify Template Import Method. Then, click **Next**.
   - **Enter Template Content**: Enter the content of a JSON template in the **Prepare Template** section.
   - **My Templates**: Select an existing template.
5. In the **Configure Template Parameters** step, modify the parameter settings in the Set Parameter section. Then, click **Next**.

   > **Note** The parameters that you need to configure vary based on the templates. Configure the parameters as instructed in the ROS console.

6. In the **Configure Stack** step, configure Rollback on Failure and Timeout Period based on your business requirements, and click **Next**.
7. In the **Confirm** step, check the template and stack configurations, and click **Create Stack**.

5.1.3.3. Recreate a stack

You can recreate a stack if you want to change your template, stack configurations, and the organization, resource set, and region ID of the stack. This topic describes how to recreate a stack.

Prerequisites

A stack is created. For more information, see Create a stack.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **Stacks**.
3. On the **Stacks** page, find the stack that you want to recreate and click **Re-create** in the **Actions** column.
4. In the **Select Template** step, configure **Organization**, **Resource Set**, and **regionId**.
5. Select a value for Specify Template Import Method. Enter the content of your template in the Prepare Template section. Then, click **Next**.
   - **Enter Template Content**: Enter the content of a JSON template in the **Prepare Template** section.
   - **My Templates**: Select an existing template.
6. In the **Configure Template Parameters** step, modify the parameter settings in the Stacks and Set Parameters sections. Then, click **Next**.

   > Note
   > - The parameters that you need to configure vary based on the templates. Configure the parameters as instructed in the ROS console.
   > - The name must be unique in your Apsara Stack tenant account.

7. In the **Configure Stack** step, configure Rollback on Failure and Timeout Period based on your business requirements and click **Next**.
8. In the **Confirm** step, check the template and stack configurations and click **Create Stack**.

5.1.3.4. Delete a stack

You cannot delete a stack that is in the process of an operation such as create or update.

Prerequisites

A stack is created. For more information, see Create a stack.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **Stacks**.
3. On the **Stacks** page, find the stack that you want to delete and click **Delete** in the **Actions** column.
4. In the dialog box that appears, choose a method to delete the stack.
   - **Retain Resources**: retains the resources in a stack when the stack is deleted.
   - **Release Resources**: releases the resources in a stack when the stack is deleted. Proceed with caution.
5. Click **OK**.

5.1.4. Manage templates

5.1.4.1. Create a template

You can use Resource Orchestration Service (ROS) to create a JSON template, and then use the template to create a stack. This topic describes how to create a template.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **My Templates**.
3. On the **My Templates** page, click **Create Template**.
4. In the **Create Template** dialog box, configure **Template Name**, **Template Description**, **Organization**, **Resource Set**, and **Template Content**.
5. Click **OK**.

5.1.4.2. Edit a template

You can edit the name, description, and content of a template based on your business requirements.

Prerequisites

A template is created. For more information, see Create a template.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **My Templates**.
3. On the **My Templates** page, find the template that you want to edit and click **Edit** in the **Actions** column.
4. In the **Edit Template** dialog box, configure **Template Name**, **Template Description**, and **Template Content**.
5. Click **OK**.

5.1.4.3. Delete a template

You can delete templates that you no longer need.

Prerequisites

A template is created. For more information, see Create a template.

Procedure

1. Log on to the ROS console. For more information, see Log on to the ROS console.
2. In the left-side navigation pane, click **My Templates**.
3. On the **My Templates** page, find the template that you want to delete and click **Delete** in the **Actions** column.
4. In the **Delete** message, click **OK**.

5.1.5. Template syntax

5.1.5.1. Template structure

A template is a UTF-8 encoded JSON file that is used to create stacks. Templates serve as the blueprint for underlying infrastructure and architecture. Templates define the configurations of Apsara Stack resources and dependencies between the resources.

ROS template structure

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Description" : "The description of the template, which is used to provide information such as use scenarios and architecture of the template",
  "Metadata" : {
    // The template metadata that provides information such as the layout for visualizations.
  },
  "Parameters" : {
    // The parameters that you can specify when you create a stack.
  },
  "Mappings" : {
    // The mapping tables. Mapping tables are nested tables.
  },
  "Conditions": {
    // The conditions defined by using internal condition functions. These conditions determine when to create associated resources.
  },
  "Resources" : {
    // The detailed information of resources such as configurations and dependencies.
  },
  "Outputs" : {
    // The outputs that are used to provide information such as resource properties. You can use the Resource Orchestration Service (ROS) console or API to obtain the information.
  }
}
```

ROSTemplateFormatVersion

Required. The template versions supported by ROS. Current version: 2015-09-01.

Description

Optional. The description of the template, which is used to provide information such as use scenarios and architecture of the template.

A detailed description can help users better understand the content of the template.

Metadata

Optional. The metadata of the template, in the JSON format.

Parameters

Optional. The parameters that you can specify when you create a stack. An Elastic Compute Service (ECS) instance type is often defined as a parameter. Parameters have default values. Parameters can improve the flexibility and reusability of the template. When you create a stack, select appropriate specifications.

Mappings

Optional. Mappings are defined as nested mapping tables. You can use Fn::FindInMap to retrieve values corresponding to keys. You can also use parameter values as keys. For example, you can search the region-image mapping table for desired images by region.

Conditions

Optional. The conditions defined by using Fn::And, Fn::Or, Fn::Not, and Fn::Equals. Multiple conditions are separated by commas (,). The system evaluates all conditions in the template before it creates or updates a stack. All resources associated with `true` conditions are created, and all resources associated with `false` conditions are ignored.

Resources

Optional. The detailed information of resources in the stack created based on the template. The information includes resource dependencies and configurations.

Outputs

Optional. The outputs that are used to provide information such as resource properties. You can use the ROS console or API to obtain the information.

5.1.5.2. Parameters

When you create a template, you can use the Parameters section to improve the flexibility and reusability of the template. When you create a stack, you can replace parameter values in the template.

For example, you have a web application requiring a stack that contains one Server Load Balancer (SLB) instance, two Elastic Compute Service (ECS) instances, and one ApsaraDB RDS instance. If the web application has a heavy workload, you can select ECS instances with advanced specifications when you create the stack. Otherwise, you can select ECS instances with basic specifications. The following example shows how to define the InstanceType parameter for an ECS instance:

```
"Parameters" : {
  "InstanceType" : {
    "Type" : "String",
    "AllowedValues":["ecs.t1.small","ecs.s1.medium", "ecs.m1.medium", "ecs.c1.large"],
    "Default": "ecs.t1.small",
    "Label": "ECS instance type",
    "Description" : "The type of the ECS instance that you want to create. Default value: ecs.t1.small
. Valid values: ecs.t1.small, ecs.s1.medium, ecs.m1.medium, and ecs.c1.large."
  }
}
```

You can assign a value to the InstanceType parameter when you create stacks based on templates. If this parameter is not specified, the default value `ecs.t1.small` is used.

The following example shows how to reference the InstanceType parameter when you define a resource:

```
"Webserver" : {
  "Type" : "ALIYUN::ECS::Instance",
  "InstanceType": {
    "Ref": "InstanceType"
  }
}
```

Syntax

Each parameter consists of a name and properties. The parameter name can contain only letters and digits, and must be unique within the template. You can use the `Label` field to define the alias of a parameter.

The following table describes the parameter properties.

Parameter property	Required	Description

Parameter property	Required	Description
Type	Yes	The data type of the parameter. • String: a string value. Example: `"ecs.s1.medium"`. • Number: an integer or a floating-point number. Example: 3.14. • CommaDelimitedList: a set of strings separated by commas (,), which can be indexed by using the Fn::Select function. Example: `"80, foo, bar"`. • Json: a JSON string. Example: `{ "foo": "bar" }`. • Boolean: a Boolean value. Example: `true` or `false`.
Default	No	The default value of the parameter. If you do not specify a value when you create a stack, Resource Orchestration Service (ROS) checks whether a default value is defined in the template. If a default value is found, ROS uses the default value. Otherwise, an error is returned.
AllowedValues	No	The list of one or more valid parameter values.
AllowedPattern	No	The regular expression that is used to check whether the specified parameter value is a string. If the input is not a string, an error is returned.
MaxLength	No	The integer value that determines the longest string allowed for a String-type parameter.
MinLength	No	The integer value that determines the shortest string allowed for a String-type parameter.
MaxValue	No	The numeric value that determines the maximum value allowed for a Number-type parameter.
MinValue	No	The numeric value that determines the minimum value allowed for a Number-type parameter.
NoEcho	No	Specifies whether to mask the parameter value when the GetStack operation is called. If you set this property to `true`, only asterisks (*) are returned.
Description	No	The string that describes the parameter.
ConstraintDescription	No	The description of the parameter constraints.
Label	No	The alias of the parameter, encoded in UTF-8. When you create a web form based on a template, the `Label` value can be mapped to the parameter name.

Parameter property	Required	Description
AssociationProperty	No	The associated resource property. If you specify this parameter property, ROS verifies whether the specified parameter value is valid and provides a list of valid values based on the associated resource property. Valid values: • `ALIYUN::ECS::Instance::ImageId` • `ALIYUN::ECS::Instance::ZoneId` • `ALIYUN::ECS::VPC::VPCId` • `ALIYUN::ECS::VSwitch::VSwitchId` For example, if you set `AssociationProperty` to `ALIYUN::ECS::Instance::ImageId`, ROS verifies whether the specified image ID is valid and lists other valid values in a drop-down list.
Confirm	No	Specifies whether to enter the parameter value for a second time if the NoEcho property is set to `true`. Default value: `false`. **Notice** The Confirm property can be set to `true` only when it is used with a String-type parameter and when the NoEcho parameter is set to `true`.

Examples

In the following example, two parameters are defined in the Parameters section:

- `username`
  - Type: String
  - Valid values:
    - `anonymous`
    - `user-one`
    - `user-two`
  - Length: 6 to 12 characters

  Notice The default value `anonymous` must also meet the length and valid value requirements.
- `password`
  - Type: String
  - Length: 1 to 41 characters
  - The password can contain letters and digits.
  - If you set the NoEcho property to `true`, the GetStack operation does not return parameter values.

```
"Parameters": {
    "username": {
        "Label": "Username"
        "Description": "Enter the username"
        "Default": "anonymous",
        "Type": "String",
        "MinLength": "6",
        "MaxLength": "12",
        "AllowedValues": ["anonymous", "user-one", "user-two"]
    },
    "password": {
        "Label": "Password"
        "NoEcho": "True",
        "Description": "Enter the password"
        "Type": "String",
        "MinLength": "1",
        "MaxLength": "41",
        "AllowedPattern": "[a-zA-Z0-9]*"
    }
}
```

Pseudo parameters

Pseudo parameters are internal parameters provided by the ROS engine. They can be referenced in the same manner as user-defined parameters, and their values are determined when ROS is running. The following pseudo parameters are supported:

- `ALIYUN::StackName` : the name of the stack.
- `ALIYUN::StackId` : the ID of the stack.
- `ALIYUN::Region` : the region where the stack resides.
- A `LIYUN::AccountId` : the account ID of the stack.
- `ALIYUN::NoValue` : specifies whether the specific resource property is deleted when the resource is created or updated.

5.1.5.3. Resources

This topic describes the properties of each resource and dependencies between resources in a stack. A resource can be referenced by other resources and output items.

Syntax

Each resource consists of an ID and a description. All resource descriptions are enclosed in braces {}. Multiple resources are separated by commas (,). The following sample code shows the Resources syntax:

```
"Resources" : {
    "Resource1 ID" : {
        "Type" : "The resource type",
        "Condition": "The condition that specifies whether to create the resource",
        "Properties" : {
            The description of the resource properties
        }
    },
    "Resource2 ID" : {
        "Type" : "The resource type",
        "Condition": "The condition that specifies whether to create the resource",
        "Properties" : {
            The description of the resource properties
        }
    }
}
```

Parameter description:

- The resource ID must be unique within the template. You can use the resource ID to reference the resource in other parts of the template.
- The Type parameter specifies the type of the resource that is being declared. For example, ALIYUN::ECS::Instance indicates that the resource is an Elastic Cloud Service (ECS) instance.
- The Properties section provides additional options that you can specify for a resource. For example, you must specify an image ID for each ECS instance. The image ID is one of the resource properties.

Examples

```
"Resources" : {
  "ECSInstance" : {
    "Type" : "ALIYUN::ECS::Instance",
    "Properties" : {
      "ImageId" : "m-25l0r****"
    }
  }
}
```

If a resource does not need properties to be declared, omit the Properties section of that resource.

Property values can be text strings, string lists, Boolean values, referenced parameters, or return values of functions.

The following example shows how to declare different types of property values:

```
"Properties" : {
    "String" : "string",
    "LiteralList" : [ "value1", "value2" ],
    "Boolean" : "true"
    "ReferenceForOneValue" :  { "Ref" : "ResourceID" } ,
    "FunctionResultWithFunctionParams" : {
        "Fn::Join" : [ "%", [ "Key=", { "Ref" : "SomeParameter" } ] ] }
}
```

DeletionPolicy

The DeletionPolicy parameter specifies whether to retain a resource when its stack is deleted. The following sample code shows how to use the DeletionPolicy parameter to retain an ECS instance when its stack is deleted:

```
"Resources" : {
  "ECSInstance" : {
    "Type" : "ALIYUN::ECS::Instance",
    "Properties" : {
      "ImageId" : "m-25l0r****"
    },
    "DeletionPolicy" : "Retain"
  }
}
```

DependsOn

The DependsOn parameter allows you to create a specific resource after you create its dependent resource. If you specify the DependsOn parameter for a resource, the resource is created only after its dependent resource specified by the DependsOn parameter is created.

In the following example, WebServer is created only after DatabaseServer is created:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "DependsOn": "DatabseServer"
    },
    "DatabseServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
      }
    }
  }
}
```

Condition

The Condition parameter specifies whether to create the resource. The resource can be created only when the Condition parameter is set to true.

In the following example, WebServer is created only if the condition determined by the MaxAmount parameter is true:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters": {
    "MaxAmount": {
      "Type": "Number",
      "Default": 1
    }
  },
  "Conditions": {
    "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
  }
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Condition": "CreateWebServer",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
        "MaxAmount": {"Ref": "MaxAmount"}
      }
    },
    "DatabseServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small"
      }
    }
  }
}
```

Resource declaration example

The following example shows how to declare a resource:

```
"Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-25l0r****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "Tags": [{
            "Key": "Department1",
            "Value": "HumanResource"
        },{
            "Key": "Department2",
            "Value": "Finance"
        }
        ]
      }
    },
    "ScalingConfiguration": {
      "Type": "ALIYUN::ESS::ScalingConfiguration",
      "Properties": {
        "ImageId": "ubuntu1404_64_20G_aliaegis_2015****.vhd",
        "InstanceType": "ecs.t1.small",
        "InstanceId": "i-25xhh****",
        "InternetChargeType": "PayByTraffic",
        "InternetMaxBandwidthIn": 1,
        "InternetMaxBandwidthOut": 20,
        "SystemDisk_Category": "cloud",
        "ScalingGroupId": "bwhtvpcBcKYac9fe3vd0****",
        "SecurityGroupId": "sg-25zwc****",
        "DiskMappings": [
            {
                "Size": 10
            },
            {
                "Category": "cloud",
                "Size": 10
            }
        ]
      }
    }
}
```

5.1.5.4. Outputs

The Outputs section is used to define the values returned when the GetStack operation is called. For example, if you define an Elastic Compute Service (ECS) instance ID as an output item, the ECS instance ID is returned when the GetStack operation is called.

Syntax

Each output item consists of an ID and a description. All output descriptions are enclosed in braces {}. Multiple output items are separated by commas (,). Each output item can have multiple values in an array format. The following example shows the Outputs syntax:

```
"Outputs" : {
  "Output1 ID" : {
    "Description": "The description of the output item",
    "Condition": "The condition that specifies whether to provide resource properties",
    "Value": "The output value expression"
  },
  "Output2 ID" : {
    "Description": "The description of the output item",
    "Condition": "The condition that specifies whether to provide resource properties",
    "Value" : [
      "Output value expression 1",
      "Output value expression 2",
      ...
    ]
  }
}
```

- Output ID: the ID of the output item. Duplicate IDs are not allowed within a template.
- Description: optional. The description of the output item.
- Value: required. The value returned when the GetStack operation is called.
- Condition: optional. The condition that specifies whether to create a resource and provide its information. The resource is created and its information is provided only when the specified condition is `true`.

  In the following example, WebServer is created only if the condition determined by the MaxAmount parameter is true:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters": {
    "MaxAmount": {
      "Type": "Number",
      "Default": 1
    }
  },
  "Conditions": {
    "CreateWebServer": {"Fn::Not": {"Fn::Equals": [0, {"Ref": "MaxAmount"}]}}
  }
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Condition": "CreateWebServer",
      "Properties": {
        "ImageId" : "m-2510r****",
        "InstanceType": "ecs.t1.small"
        "MaxAmount": {"Ref": "MaxAmount"}
      }
    }
  }
  "Outputs": {
    "WebServerIP": {
      "Condition": "CreateWebServer",
      "Value": {
        "Fn::GetAtt": ["WebServer", "PublicIps"]
      }
    }
  }
}
```

Examples

The following example contains two output items:

- The InstanceId value of WebServer
- The PublicIp and PrivateIp values of WebServer

```
"Outputs": {
  "InstanceId": {
    "Value" : {"Fn::GetAtt": ["WebServer", "InstanceId"]}
  },
  "PublicIp & PrivateIp": {
    "Value" : [
      {"Fn::GetAtt": ["WebServer", "PublicIp"]},
      {"Fn::GetAtt": ["WebServer", "PrivateIp"]}
    ]
  }
}
```

5.1.5.5. Functions

Resource Orchestration Service (ROS) provides several built-in functions to help you manage stacks. You can use built-in functions to define Resources and Outputs.

Fn::Base64Encode

The Fn::Base64Encode function is used to return the Base64 representation of the input string.

- Declaration

  ```
  "Fn::Base64Encode": "stringToEncode"
  ```

- Parameters

  `stringToEncode`: the string to be encoded in Base64.

- Return value

  The Base64 representation of the input string.

- Examples

  ```
  {"Fn::Base64Encode": "string to encode"}
  ```

  `c3RyaW5nIHRvIGVuY29kZQ==` is returned in this example.

Fn::Base64Decode

The Fn::Base64Decode function is used to return a string decoded from a Base64-encoded string.

- Declaration

  ```
  {"Fn::Base64Decode": "stringToEncode"}
  ```

- Parameters

  `stringToDecode`: the string decoded from the Base64-encoded string.

- Return value

  The string decoded from the Base64-encoded string.

- Examples

  ```
  {"Fn::Base64Decode": "c3RyaW5nIHRvIGVuY29kZQ=="}
  ```

`string to encode` is returned in this example.

Fn::Base64

The Fn::Base64 function returns the Base64 representation of the input string.

- Declaration

  ```
  "Fn::Base64": stringToEncode
  ```

- Parameters

  valueToEncode: the string to be encoded in Base64.

- Return value

  The Base64 representation of the input string.

- Examples

  ```
  "Fn::Base64":"string to encode"
  ```

Fn::FindInMap

The Fn::FindInMap function is used to return the values based on keys in a two-level mapping that is declared in the Mappings section.

- Declaration

  ```
  "Fn::FindInMap": ["MapName", "TopLevelKey", "SecondLevelKey"]
  ```

- Parameters
  - `MapName`: the ID of a mapping declared in the Mappings section that contains keys and values.
  - `TopLevelKey`: the top-level key name. The value is a list of key-value pairs.
  - `SecondLevelKey`: the second-level key name. The value is a string or a number.

- Return value

  The value that is assigned to the SecondLevelKey parameter.

- Examples

  The ImageId property must be specified when you create a WebServer instance. The Mappings section describes the ImageId mappings by region. The Parameters section describes the regions that must be specified by template users. Fn::FindInMap finds the corresponding ImageId mapping in RegionMap based on the region specified by a user, and then finds the corresponding ImageId values in the mapping.
  - MapName can be set to a custom value, which is `RegionMap` in this example.
  - TopLevelKey is set to the region where the stack is created, which is `{ "Ref" : "regionParam" }` in this example.
  - SecondLevelKey is set to the required architecture, which is `32` in this example.

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou",
        "beijing"
      ]
    }
  },
  "Mappings": {
    "RegionMap": {
      "hangzhou": {
        "32": "m-25l0rcfjo",
        "64": "m-25l0rcfj1"
      },
      "beijing": {
        "32": "m-25l0rcfj2",
        "64": "m-25l0rcfj3"
      }
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": {
          "Fn::FindInMap": [
            "RegionMap",
            {"Ref": "regionParam"},
            "32"
          ]
        },
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "Tags": [
          {
            "Key": "key1",
            "Value": "value1"
          },
          {
            "Key": "key2",
            "Value": "value2"
          }
        ]
      }
    }
  }
}
```

- Supported functions
  - Fn::FindInMap
  - Ref

Fn::GetAtt

The Fn::GetAtt function is used to return the value of a property from a resource in a template.

- Declaration

```
"Fn::GetAtt": ["resourceID", "attributeName"]
```

- Parameters
  - `resourceID`: the ID of the resource.
  - `attributeName`: the name of the resource property.
- Return value

  The value of the resource property.
- Examples

  The ImageId property of MyEcsInstance is returned in this example.

```
{"Fn::GetAtt" : ["MyEcsInstance" , "ImageID"]}
```

Fn::Join

The Fn::Join function is used to combine a set of values into a single value that is separated by a specified delimiter.

- Declaration

```
{"Fn::Join": ["delimiter", ["string1", "string2", ... ]]}
```

- Parameters
  - `delimiter`: the value used to divide the string. The delimiter value can be left blank so that all the values are directly combined.
  - `[ "string1", "string2", ... ]`: the list of values that are combined into a string.
- Return value

  The combined string.
- Examples

```
{"Fn::Join": [ ",", ["a", "b", "c"]]}
```

  `"a,b,c"` is returned in this example.
- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Select

The Fn::Select function is used to return a single data element from a list of data elements by using an index.

- Declaration
  - The following example assumes that the list of data elements is an array:

```
"Fn::Select": ["index", ["value1", "value2", ... ]]
```

- The following example assumes that the list of data elements is a mapping table:

```
"Fn::Select": ["index", {"key1": "value1", ... }]
```

- Parameters

  `index`: the index of the object data element. If the list of data elements is an array, the index must be an integer ranging from 0 to N-1, where N indicates the number of elements in the array. If the list of data elements is a mapping table, the index must be a key in the mapping table.

  If the corresponding value of the index cannot be found, the system returns an empty string.

- Return value

  The object data element.

- Examples
  - The following example assumes that the list of data elements is an array:

```
{"Fn::Select": ["1", ["apples", "grapes", "oranges", "mangoes"]]}
```

    `"grapes"` is returned in this example.
  - The following example assumes that the list of data elements is a mapping table:

```
{"Fn::Select": ["key1", {"key1": "grapes", "key2": "mangoes"}]}
```

    `"grapes"` is returned in this example.
  - The following example assumes that the list of data elements is a comma-delimited list:

```
"Parameters": {
  "userParam": {
    "Type": "CommaDelimitedList",
      "Default": "10.0.100.0/24, 10.0.101.0/24, 10.0.102.0/24"
  }
}
"Resources": {
  "resourceID": {
      "Properties": {
          "CidrBlock": {"Fn::Select": ["0", {"Ref": "userParam"}]}
    }
  }
}
```

- Supported functions
  - For the Fn::Select index value, you can use the Ref function.
  - For the Fn::Select list of data elements, you can use the following functions:
    - Fn::Base64Encode
    - Fn::FindInMap
    - Fn::GetAtt
    - Fn::Join
    - Fn::Select
    - Ref

Ref

The Ref function is used to return the value of a specified parameter or resource.

If the specified parameter is a resource ID, the value of the resource is returned. Otherwise, the system returns the value of the specified parameter.

- Declaration

```
"Ref": "logicalName"
```

- Parameters

  `logicalName`: the logical name of the resource or parameter that you want to reference.

- Return value

  The value of the resource or parameter.

- Examples

  The following example demonstrates how to use the Ref function to specify regionParam as the region parameter for RegionMap of WebServer:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou",
        "beijing"
      ]
    }
  },
  "Mappings": {
    "RegionMap": {
      "hangzhou": {
        "32": "m-25l0rcfjo",
        "64": "m-25l0rcfj1"
      },
      "beijing": {
        "32": "m-25l0rcfj2",
        "64": "m-25l0rcfj3"
      }
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": {
          "Fn::FindInMap": [
            "RegionMap",
            {"Ref": "regionParam"},
            "32"
          ]
        },
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "Tags": [
          {
            "Key": "tiantt",
            "Value": "ros"
          },
          {
            "Key": "tiantt1",
            "Value": "ros1"
          }
        ]
      }
    }
  }
}
```

- Supported function

  When you use the Ref function, you cannot use other functions in it at the same time. You must specify a string value for the logical ID of a resource.

Fn::GetAZs

The Fn::GetAZs function is used to return a list of zones for a specified region.

- Declaration

```
"Fn::GetAZs": "region"
```

- Parameters

  `region`: the ID of the region.

- Return value

  The list of zones within the specified region.

- Examples

  The following example demonstrates how to create an Elastic Compute Service (ECS) instance in the first zone of a specified region:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": "centos7u2_64_40G_cloudinit_2016****.raw",
        "InstanceType": "ecs.n1.tiny",
        "SecurityGroupId": "sg-2zedcm7ep5quses0****",
        "Password": "Ros1****",
        "AllocatePublicIP": true,
        "InternetChargeType": "PayByTraffic",
        "InternetMaxBandwidthIn": 100,
        "InternetMaxBandwidthOut": 100,
        "SystemDiskCategory": "cloud_efficiency",
        "IoOptimized": "optimized",
        "ZoneId": {"Fn::Select": ["0", {"Fn::GetAZs": {"Ref": "ALIYUN::Region"}}]}
      }
    }
  },
  "Outputs": {
    "InstanceId": {
         "Value": {"Fn::GetAtt": ["WebServer","InstanceId"]}
    },
    "PublicIp": {
         "Value": {"Fn::GetAtt": ["WebServer","PublicIp"]}
    }
  }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::FindInMap
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Replace

The Fn::Replace function is used to replace a specified substring contained in a string with a new substring.

- Declaration

```
{"Fn::Replace": [{"object_key": "object_value"}, "object_string"]}
```

- Parameters
  - `object_key`: the substring to be replaced.
  - `object_value`: the new substring to replace the previous substring.
  - `object_string`: the string whose `object_key` is replaced.
- Return value

  The string after replacement.
- Examples

  The following example demonstrates how to replace "print" with "echo" in the specified script:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "centos_7_2_64_40G_base_2017****.vhd",
        "InstanceType": "ecs.n1.medium",
        "SecurityGroupId": "sg-94q49****",
        "Password": "MytestPassword****",
        "IoOptimized": "optimized",
        "VSwitchId": "vsw-94vdv8****",
        "VpcId": "vpc-949uz****",
        "SystemDiskCategory": "cloud_ssd",
        "UserData": {"Fn::Replace": [{"print": "echo"},
         {"Fn::Join": ["", [
             "#!/bin/sh\n",
             "mkdir ~/test_ros\n",
             "print hello > ~/1.txt\n"
         ]]}]}
      }
    }
  },
  "Outputs": {
    "InstanceId": {
         "Value" : {"Fn::GetAtt": ["WebServer","InstanceId"]}
    },
    "PublicIp": {
         "Value" : {"Fn::GetAtt": ["WebServer","PublicIp"]}
    }
  }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref

Fn::Split

The Fn::Split function is used to split a string into a list of values separated by a specified delimiter and return the list.

- Declaration

```
"Fn::Split": ["delim",  "original_string"]
```

- Parameters
  - `delim`: the specified delimiter, which can be a comma (,), semicolon (;), line break (\n), or indent (\t).
  - `original_string`: the string to be split.
- Return value

  A list of string values.
- Examples
  - The following example assumes that the list of data elements is an array:

```
{"Fn::Split": [";", "foo; bar; achoo"]}
```

    `["foo", " bar", "achoo "]` is returned in this example.
  - The following example demonstrates how to use Fn::Split to split InstanceIds:

```
{
  "Parameters": {
    "InstanceIds": {
      "Type": "String",
      "Default": "instane1_id,instance2_id,instance2_id"
    }
  },
  "Resources": {
    "resourceID": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "BackendServerList": {
          "Fn::Split": [
            ",",
            {
              "Ref": "InstanceIds"
            }
          ]
        }
      }
    }
  }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::FindInMap
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Fn::Replace
  - Fn::GetAZs
  - Fn::If
  - Ref

Fn::Equals

The Fn::Equals function is used to compare whether two values are equal. If the two values are equal, true is returned. If the two values are not equal, false is returned.

- Declaration

```
{"Fn::Equals": ["value_1", "value_2"]}
```

- Parameters

  `value`: the values to be compared.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Equals to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "EnvType": {
      "Default": "pre",
      "Type": "String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {
      "Fn::Equals": [
        "prod",
        {"Ref": "EnvType"}
      ]
    }
  }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::And

The Fn::And function is used to represent the AND operator, and must contain at least two conditions. If all the specified conditions are evaluated as true, true is returned. If any condition is evaluated as false, false is returned.

- Declaration

```
{"Fn::And": ["condition", {...}]}
```

- Parameters

  `condition`: the condition to be evaluated.

- Return value

  true or false.

- Examples

The following example demonstrates how to use Fn::And to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
    "TestAndCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
  }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::Or

The Fn::Or function is used to represent the OR operator, and must contain at least two conditions. If any specified condition is evaluated as true, true is returned. If all the conditions are evaluated as false, false is returned.

- Declaration

```
{"Fn::Or": ["condition", {...}]}
```

- Parameters

  `condition`: the condition to be evaluated.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Or to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestEqualsCond": {"Fn::Equals": ["prod", {"Ref": "EnvType"}]},
    "TestOrCond": {"Fn::And": ["TestEqualsCond", {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}]}
  }
}
```

- Supported functions
  - Fn::Or

- Fn::Not
- Fn::Equals
- Fn::FindInMap
- Fn::And
- Ref

Fn::Not

The Fn::Not function is used to represent the NOT operator. If a condition is evaluated as false, true is returned. If a condition is evaluated as true, false is returned.

- Declaration

```
{"Fn::Not": "condition"}
```

- Parameters

  `condition`: the condition to be evaluated.

- Return value

  true or false.

- Examples

  The following example demonstrates how to use Fn::Not to define a condition in the Conditions section:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Parameters":{
    "EnvType":{
      "Default":"pre",
      "Type":"String"
    }
  },
  "Conditions": {
    "TestNotCond": {"Fn::Not": {"Fn::Equals": ["pre", {"Ref": "EnvType"}]}}
  }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::If

This function returns one of two possible values. If a specified condition is evaluated as true, one value is returned. If the specified condition is evaluated as false, the other value is returned. The property values of Resources and Outputs in templates support the Fn::If function. You can use the `ALIYUN::NoValue` pseudo parameter as the return value to delete the corresponding property.

- Declaration

```
{"Fn::If": ["condition_name", "value_if_true", "value_if_false"]}
```

- Parameters

- `condition_name`: the name of the condition in the Conditions section. A condition is referenced by using the condition name.
- `value_if_true`: If the specified condition is evaluated as true, this value is returned.
- `value_if_false`: If the specified condition is evaluated as false, this value is returned.

- Examples

  The following example demonstrates how to determine whether to create a data disk based on input parameters:

```
{
    "ROSTemplateFormatVersion":"2015-09-01",
    "Parameters":{
        "EnvType":{
            "Default":"pre",
            "Type":"String"
        }
    },
    "Conditions":{
        "CreateDisk":{
            "Fn::Equals":[
                "prod",
                {
                    "Ref":"EnvType"
                }
            ]
        }
    },
    "Resources":{
        "WebServer":{
            "Type":"ALIYUN::ECS::Instance",
            "Properties":{
                "DiskMappings":{
                    "Fn::If":[
                        "CreateDisk",
                        [
                            {
                                "Category":"cloud_efficiency",
                                "DiskName":"FirstDataDiskName",
                                "Size":40
                            },
                            {
                                "Category":"cloud_ssd",
                                "DiskName":"SecondDataDiskName",
                                "Size":40
                            }
                        ],
                        {
                            "Ref":"ALIYUN::NoValue"
                        }
                    ]
                },
                "VpcId":"vpc-2zew9pxh2yirtzqxd****",
                "SystemDiskCategory":"cloud_efficiency",
                "SecurityGroupId":"sg-2zece6wcqriejf1v****",
                "SystemDiskSize":40,
                "ImageId":"centos_6_8_64_40G_base_2017****.vhd",
                "IoOptimized":"optimized",
                "VSwitchId":"vsw-2zed9txvy7h2srqo6****",
                "InstanceType":"ecs.n1.medium"
```

```
            }
        }
    },
    "Outputs":{
        "InstanceId":{
            "Value":{
                "Fn::GetAtt":[
                    "WebServer",
                    "InstanceId"
                ]
            }
        },
        "ZoneId":{
            "Value":{
                "Fn::GetAtt":[
                    "WebServer",
                    "ZoneId"
                ]
            }
        }
    }
}
```

- Supported functions
  - Fn::Or
  - Fn::Not
  - Fn::Equals
  - Fn::FindInMap
  - Fn::And
  - Ref

Fn::ListMerge

The Fn::ListMerge function is used to merge multiple lists into one list.

- Declaration

```
{"Fn::ListMerge": [["list_1_item_1", "list_1_imte_2", ...], ["list_2_item_1", "list_2_imte_2", ...]
]}
```

- Parameters
  - `["list_1_item_1", "list_1_imte_2", ...]`: the first list to merge.
  - `["list_2_item_1", "list_2_imte_2", ...]`: the second list to merge into the first list.
- Examples

  The following example demonstrates how to attach two ECS instance groups to a Server Load Balancer (SLB) instance:

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "ros",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth",
      }
    },
    "BackendServer1": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Properties": {
        "ImageId" : "m-2ze9uqi7wo61hwep****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-2ze8yxgempcdsq3****",
        "MaxAmount": 1,
        "MinAmount": 1
      }
    },
    "BackendServer2": {
      "Type": "ALIYUN::ECS::InstanceGroup",
      "Properties": {
        "ImageId" : "m-2ze9uqi7wo61hwep****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-2ze8yxgempcdsq3iu****",
        "MaxAmount": 1,
        "MinAmount": 1
      }
    },
    "Attachment": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "LoadBalancerId": {"Ref": "LoadBalancer"},
        "BackendServerList": { "Fn::ListMerge": [
            {"Fn::GetAtt": ["BackendServer1", "InstanceIds"]},
            {"Fn::GetAtt": ["BackendServer2", "InstanceIds"]}
          ]
        }
      }
    }
  }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If

Fn::GetJsonValue

The Fn::GetJsonValue function is used to resolve a JSON string and obtain its key value from the first layer.

- Declaration

```
{"Fn::GetJsonValue": ["key", "json_string"]}
```

- Parameters
  - `key`: the key value.
  - `json_string`: the specified JSON string to be resolved.
- Examples

  In the following example, the WebServer instance executes UserData and returns a JSON string, and the WebServer2 instance then obtains the corresponding key value from the string.

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-2ze45uwova5fedlu****",
        "InstanceType": "ecs.n1.medium",
        "SecurityGroupId": "sg-2ze7pxymaix640qr****",
        "Password": "Wenqiao****",
        "IoOptimized": "optimized",
        "VSwitchId": "vsw-2zei67xd9nhcqxze****",
        "VpcId": "vpc-2zevx9ios1rszqv0a****",
        "SystemDiskCategory": "cloud_ssd",
        "UserData": {"Fn::Join": ["", [
             "#!/bin/sh\n",
             "mkdir ~/test_ros\n",
             "print hello > ~/1.txt\n",
             "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
             "\n",
             "Fn::GetAtt": ["WaitConHandle", "CurlCli"],
             " -d '{\\"id\\" : \\"1\\", \\"data\\": [\\"1111\\", \\"2222\\"]}'\n"
         ]]},
         "PrivateIpAddress": "192.168.XX.XX",
         "HostName": "userdata-1
      }
    },
    "WaitConHandle": {
        "Type": "ALIYUN::ROS::WaitConditionHandle"
    },
    "WaitCondition": {
        "Type": "ALIYUN::ROS::WaitCondition",
        "Properties": {
          "Handle": {"Ref": "WaitConHandle"},
          "Timeout": 900
        }
    },
    "WebServer2": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId" : "m-2ze45uwova5fedlu****",
        "InstanceType": "ecs.n1.medium",
        "SecurityGroupId": "sg-2ze7pxymaix640qr****",
        "Password": "Wenqiao****,
        "IoOptimized": "optimized",
        "VSwitchId": "vsw-2zei67xd9nhcqxzec****",
        "VpcId": "vpc-2zevx9ios1rszqv0a****",
        "SystemDiskCategory": "cloud_ssd",
        "UserData":
```

```
          {"Fn::Join": ["", [
             "#!/bin/sh\n",
             "mkdir ~/test_ros\n",
             "echo hello > ~/1.txt\n",
             "server_1_token=",
             {"Fn::GetJsonValue": ["1", { "Fn::GetAtt": ["WaitCondition", "Data"]}]},
             "\n"
          ]]},
          "PrivateIpAddress": "192.168.XX.XX",
          "HostName": "userdata-2"
       }
     },
   },
   "Outputs": {
     "InstanceId": {
          "Value" : {"Fn::GetAtt": ["WebServer","InstanceId"]}
     },
     "PublicIp": {
          "Value" : {"Fn::GetAtt": ["WebServer","PublicIp"]}
     }
   }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If

Fn::MergeMapToList

The Fn::MergeMapToList function is used to merge multiple mappings into a list of mapping elements.

- Declaration

```
{"Fn::MergeMapToList": [{"key_1": ["key_1_item_1", "key_1_item_2", ...]}, {"key_2":["key_2_item_1",
"key_2_item_2", ...]}, ... ]}
```

- Parameters
  - `{"key_1": ["key_1_item_1", "key_1_item_2", ...]}` : the first mapping to merge. The `"key_1"` value must be a list. `"key_1"` is the key for each mapping in the list of merged mappings. The "key_1" value is `"key_1_item_1"` for the first merged mapping and `"key_1_item_2"` for the second merged mapping. All values follow the same format. The length of the final list of merged mappings is the length of the longest list `"key_x"` from all mappings being merged. If a `"key_y"` list is shorter, the last element of the list is repeated until the list is the longest.
  - `{"key_2": ["key_2_item_1", "key_2_item_2", ...]}` : the second mapping to merge into the first mapping. The `"key_2"` value must be a list. `"key_2"` is the key for each mapping in the merged list. The "key_2" value is `"key_2_item_1"` for the first merged mapping and `"key_2_item_2"` for the second merged mapping. All values follow the same format.
- Examples

- The following example demonstrates how to merge three mappings. The length of the list based on the key values for each mapping is the same.

```
{
   "Fn::MergeMapToList": [
      {"key_1": ["kye_1_item_1", "kye_1_item_2"]},
      {"key_2": ["kye_2_item_1", "kye_2_item_2"]},
      {"key_3": ["kye_3_item_1", "kye_3_item_2"]}
   ]
}
```

The following code shows the merged result:

```
[
   {
      "key_1": "kye_1_item_1",
      "key_2": "kye_2_item_1",
      "key_3": "kye_3_item_1"
    },
    {
      "key_1": "kye_1_item_2",
      "key_2": "kye_2_item_2",
      "key_3": "kye_3_item_2"
    }
]
```

- The length of the list based on the key values for each mapping varies in the following example:

```
{
   "Fn::MergeMapToList": [
      {"key_1": ["kye_1_item_1", "kye_1_item_2"]},
      {"key_2": ["kye_2_item_1", "kye_2_item_2", "key_2_item_3"]},
      {"key_3": ["kye_3_item_1", "kye_3_item_2"]}
   ]
}
```

The following code shows the merged result:

```
[
   {
      "key_1": "kye_1_item_1",
      "key_2": "kye_2_item_1",
      "key_3": "kye_3_item_1"
    },
    {
      "key_1": "kye_1_item_2",
      "key_2": "kye_2_item_2",
      "key_3": "kye_3_item_2"
    },
    {
      "key_1": "kye_1_item_2",
      "key_2": "kye_2_item_3",
      "key_3": "kye_3_item_2"
    }
]
```

- In the following template example, all instances created in WebServer are added to the vServer group of an SLB instance:

```
{
    "ROSTemplateFormatVersion": "2015-09-01",
    "Resources": {
        "WebServer": {
          "Type": "ALIYUN::ECS::InstanceGroupClone",
          "Properties": {
              "SourceInstanceId": "i-xxxxx",
               "Password": "Hello****",
               "MinAmount": 1,
               "MaxAmount": 1
          }
        },
        "CreateVServerGroup": {
            "Type": "ALIYUN::SLB::VServerGroup",
            "Properties": {
                "LoadBalancerId": "lb-****",
                "VServerGroupName": "VServerGroup-****",
                "BackendServers": {
                   "Fn::MergeMapToList": [
                       {"Port": [6666, 9090, 8080]},
                       {"ServerId": {"Fn::GetAtt": ["WebServer", "InstanceIds"]}},
                       {"Weight": [20, 100]}
                   ]
                }
            }
        }
    }
}
```

- Supported functions
  - Fn::Base64Encode
  - Fn::GetAtt
  - Fn::Join
  - Fn::Select
  - Ref
  - Fn::If
  - Fn::ListMerge
  - Fn::GetJsonValue

Fn::Avg

The Fn::Avg function is used to return the average value of a set of numbers.

- Declaration

```
{"Fn::Avg": [ndigits, [number1, number2, ... ]]}
```

- Parameters
  - `ndigits`: the number of decimal places to display. This parameter value must be an integer.
  - `[ number1, number2, ... ]`: the set of numbers for which the average value will be calculated. Each element in the group must be a number or a string that can be converted into a number.
- Return value

  The average value of the set of numbers.

- Examples

```
{ "Fn::Avg": [ 1, [1, 2, 6.0] ] }
{ "Fn::Avg": [ 1, ['1', '2', '6.0'] ] }
```

3.0 is returned in this example.

- Supported functions
  - Fn::GetAtt
  - Ref

Fn::SelectMapList

The Fn::SelectMapList function is used to return a list of map elements.

- Declaration

```
{"Fn::SelectMapList": ["key2", [{"key1": "value1-1", "key3": "value1-3"}, {"key1": "value2-1", "key2": "value2-2"}, {"key1": "value3-1", "key2": "value3-2"}, ...] ] }
```

- Parameters
  - `key2`: the key to be queried in the map.
  - `[{ "key1": "value1-1", "key3": "value1-3" }, ... ]`: the list of maps.
- Return value

  A list of key values for all maps in the map list.
- Examples

```
{
 "Fn::SelectMapList": [
   "key2",
   [
      {"key1": "value1-1", "key3": "value1-3"},
      {"key1": "value2-1", "key2": "value2-2"},
      {"key1": "value3-1", "key2": "value3-2"}
   ]
 ]
}
```

`["value2-2","value3-2"]` is returned in this example.

Fn::Add

The Fn::Add function is used to sum the values of parameters.

- Declaration

```
{"Fn::Add": [{"Product": "ROS"}, {"Fn": "Add"}]}
```

- Parameters
  - The parameters must be arranged as a list.
  - The parameters in the list can be of the Number, List, or Dictionary type. All the parameters must be of the same type. The list must contain at least two parameters.
- Return value

  If the parameter values are numbers, sum the parameter values. If the parameter values are lists, concatenate the values. If the parameter values are dictionaries, merge the values. If the two parameters have the same key, overwrite the former parameter value with the latter.
- Examples

```
{
 "Fn::Add": [
   {"Product": "ROS"},
   {"Fn": "Add"}
 ]
}
```

`{"Fn":"Add","Product":"ROS"}` is returned in this example.

5.1.5.6. Mappings

The Mappings section is a key-value mapping table. When mappings are used in resource and output definitions, use Fn::FindInMap to find their values by specifying corresponding keys.

Syntax

A mapping consists of key-value pairs, where both the keys and values can be strings or numbers. Multiple mappings are separated by commas (,). Each mapping name must be unique. Mappings must be pure data and cannot parse functions.

Examples

The following example shows a correct mapping definition:

```
"Mappings": {
    "ValidMapping": {
        "TestKey1": {"TestValu1": "value1"},
        "TestKey2": {"TestValu2": "value2"},
        1234567890: {"TestValu3": "value3"},
        "TestKey4": {"TestValu4": 1234}
    }
}
```

The following example shows an incorrect mapping definition:

```
"Mappings": {
    "InvalidMapping1": {
        "ValueList": ["foo", "bar"],
          "ValueString": "baz"
    },
    "InvalidMapping2": ["foo", {"bar" : "baz"}],
    "InvalidMapping3": "foobar"
}
```

The following example shows how to use Fn::FindInMap to find the return value:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "regionParam": {
      "Description": "The region where the ECS instance is created",
      "Type": "String",
      "AllowedValues": [
        "hangzhou",
        "beijing"
      ]
    }
  },
  "Mappings": {
    "RegionMap": {
      "hangzhou": {
        "32": "m-25l0rcfjo",
        "64": "m-25l0rcfj1"
      },
      "beijing": {
        "32": "m-25l0rcfj2",
        "64": "m-25l0rcfj3"
      }
    }
  },
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": {
          "Fn::FindInMap": [
            "RegionMap",
            {
              "Ref": "regionParam"
            },
            "32"
          ]
        },
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "Tags": [
          {
            "Key": "Department1",
            "Value": "HumanResource"
          },
          {
            "Key": "Department2",
            "Value": "Finance"
          }
        ]
      }
    }
  }
}
```

5.1.5.7. Conditions

Condition bodies are defined by Fn::And, Fn::Or, Fn::Not, and Fn::Equals operators. These operators, along with the parameters that you specify when you create or update a stack, are used to evaluate each condition. You can reference other conditions, parameters, and mappings in your condition. Conditions are used in resource and output definitions to establish dependencies. Use Fn::If or Condition in resource and output definitions to implement conditions.

Syntax

Each condition consists of a condition name and a condition body. The condition name is a string. The condition body starts with Fn::And, Fn::Or, Fn::Not, or Fn::Equals. You can reference other conditions in your condition. Separate multiple conditions with comma (,). Each condition name must be unique.

The following functions can be used, but not as the outermost functions:

"Fn::Select", "Fn::Join", "Fn::Split", "Fn::Replace","Fn::Base64Encode", "Fn::Base64Decode", "Fn::MemberListToMap","Fn::If", "Fn::ListMerge", "Fn::GetJsonValue", "Fn::MergeMapToList","Fn::SelectMapList", "Fn::Add", "Fn::Avg", "Fn::Str", "Fn::Calculate","Ref"(parameter references only), and "Fn:: FindInMap".

Examples

- The following example shows how to define conditions:

```
"Conditions" : {
       "DevEnv": {"Fn::Equals": ["Dev", {"Ref": "EnvType"}]},
       "UTEnv": {"Fn::Equals": ["UT", {"Ref": "EnvType"}]},
       "PREEnv": {"Fn::Not": {"Fn::Or": ["DevEnv", "UTEnv"]}},
       "ProdEnv": {"Fn::And": [{"Fn::Equals": ["Prod", {"Ref": "EnvType"}]}, "PREEnv"]}
}
```

- The following example shows how to use conditions in a resource definition.

  In this example, a condition is used to determine whether to create a data disk and an Object Storage Service (OSS) bucket for an Elastic Compute Service (ECS) instance based on the EnvType value.

```
{
    "ROSTemplateFormatVersion":"2015-09-01",
    "Parameters":{
        "EnvType":{
            "Default":"pre",
            "Type":"String"
        }
    },
    "Conditions":{
        "CreateProdRes":{
            "Fn::Equals":[
                "prod",
                {
                    "Ref":"EnvType"
                }
            ]
        }
    },
    "Resources":{
        "WebServer":{
            "Type":"ALIYUN::ECS::Instance",
            "Properties":{
                "DiskMappings":{
                    "Fn::If":[
                        "CreateProdRes",
                        [
                            {
                                "Category":"cloud_efficiency",
```

```
                                "DiskName":"FirstDataDiskName",
                                "Size":40
                            },
                            {
                                "Category":"cloud_ssd",
                                "DiskName":"SecondDataDiskName",
                                "Size":40
                            }
                        ],
                        {
                            "Ref":"ALIYUN::NoValue"
                        }
                    ]
                },
                "VpcId":"vpc-2zew9pxh2yirtzqxd****",
                "SystemDiskCategory":"cloud_efficiency",
                "SecurityGroupId":"sg-2zece6wcqriejf1v****",
                "SystemDiskSize":40,
                "ImageId":"centos_6_8_64_40G_base_2017****.vhd",
                "IoOptimized":"optimized",
                "VSwitchId":"vsw-2zed9txvy7h2srqo6****",
                "InstanceType":"ecs.n1.medium"
            }
        },
        "OssBucket": {
            "Type": "ALIYUN::OSS::Bucket",
            "Condition": "CreateProdRes",
            "Properties": {
                "AccessControl": "private",
                "BucketName": "myprodbucket"
            }
        }
    },
    "Outputs":{
        "InstanceId":{
            "Value":{
                "Fn::GetAtt":[
                    "WebServer",
                    "InstanceId"
                ]
            }
        },
        "OssDomain":{
            "Condition": "CreateProdRes",
            "Value":{
                "Fn::GetAtt":[
                    "OssBucket",
                    "DomainName"
                ]
            }
        }
    }
}
```

5.1.6. Resource types

5.1.6.1. ECS

5.1.6.1.1. ALIYUN::ECS::AutoSnapshotPolicy

ALIYUN::ECS::AutoSnapshotPolicy is used to create an automatic snapshot policy.

Statement

```
{
  "Type" : "ALIYUN::ECS::AutoSnapshotPolicy",
  "Properties" : {
    "TimePoints" : String,
    "RepeatWeekdays" : String,
    "RetentionDays" : Integer,
    "DiskIds" : String,
    "AutoSnapshotPolicyName" : String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
TimePoints	List	Retained	Yes	The points in time at which automatic snapshots are created. Unit: hours.	Value range:[0, 23], represents 24 time points from 00:00 to 23:00. For example: `1` indicating 01:00. To schedule multiple automatic snapshot creation tasks in a day, you can set the TimePoints parameter as an array. • The maximum number of time points allowed is 24. • Use one format for multiple time points like [0, 1,... 23]. Separate time points with commas (,).

Parameter	Type	Required	Editable	Description	Constraint
RepeatWeekdays	List	Retained	Yes	The days of a week on which automatic snapshots are created.	Value range:[1, 7], `1` indicates Monday. To schedule multiple automatic snapshot creation tasks in a week, you can set the RepeatWeekdays parameter as an array. • You can specify up to 7 days over a one week period. • Use one format for multiple time points like [1, 2,... 7]. Separate the time points with commas (,).
RetentionDays	Integer	Retained	Yes	The number of days for which you want to retain automatic snapshots.	Default value: -1. Valid values: • -1: The automatic snapshots are retained indefinitely. • [1, 65536]: The automatic snapshots are retained for the specified number of days. Default value: -1.

Parameter	Type	Required	Editable	Description	Constraint
DiskIds	List	Retained	Yes	The ID of the destination disk. When you want to apply the automatic snapshot policy to multiple disks, you can set the diskids "d-zzzzzzzzz"]. Separate multiple disk IDs with commas (,).	None
AutoSnapshotPolicyName	String	Yes	True	The name of the automatic snapshot policy.	• The name must be 2 to 128 characters in length • It can contain letters, digits, colons (:), underscores (_), and hyphens (-). • It cannot start with http:// or https://. This parameter is empty by default.

Response parameters

Fn::GetAtt

AutoSnapshotPolicyId: the ID of the automatic snapshot policy.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AutoSnapshotPolicy": {
      "Type": "ALIYUN::ECS::AutoSnapshotPolicy",
      "Properties": {
        "TimePoints": ["0"],
        "RepeatWeekdays": ["1"],
        "RetentionDays": 10,
        "DiskIds": ["<DiskId>"],
        "AutoSnapshotPolicyName": "MyAutoSnapshotPolicy"
      }
    }
  }
}
```

5.1.6.1.2. ALIYUN::ECS::BandwidthPackage

ALIYUN::ECS::BandwidthPackage is used to create a service plan for a NAT gateway.

Syntax

```
{
  "Type": "ALIYUN::ECS::BandwidthPackage",
  "Properties": {
    "Description": String,
    "NatGatewayId": String,
    "ZoneId": String,
    "BandwidthPackageName": String,
    "Bandwidth": Integer,
    "IpCount": Integer
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
NatGatewayId	String	Yes	No	The ID of the NAT gateway to which you want to bind the service plan.	None
Bandwidth	Integer	Yes	No	The bandwidth.	Valid values: 5 to 5000. Unit: Mbit/s. Default value: 5.
IpCount	Integer	Yes	No	The number of public IP addresses assigned to the NAT gateway.	Valid values: 1 to 5.
Description	String	No	No	The description of the service plan.	The description must be 2 to 256 characters in length.
ZoneId	String	No	No	The ID of the zone where the NAT gateway resides.	None

Property	Type	Required	Editable	Description	Constraint
BandwidthPackageName	String	No	No	The name of the service plan.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter.

Response parameters

Fn::GetAtt

- BandwidthPackageId: the ID of the service plan.
- BandwidthPackageIps: all IP addresses included in the service plan.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "BandwidthPackage": {
      "Type": "ALIYUN::ECS::BandwidthPackage",
      "Properties": {
        "BandwidthPackageName": "pkg_2",
        "Description": "my_bandwidth",
        "NatGatewayId": "ngw-h1xox****",
        "IpCount": 2,
        "Bandwidth": 5,
        "ZoneId": "cn-beijing-c"
      }
    }
  },
  "Outputs": {
    "BandwidthPackageId": {
         "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageId"]}
    },
    "BandwidthPackageIps": {
         "Value": {"Fn::GetAttr": ["BandwidthPackage","BandwidthPackageIps"]}
    }
  }
}
```

5.1.6.1.3. ALIYUN::ECS::Command

ALIYUN::ECS::Command is used to create a Cloud Assistant command.

Statement

```
{
  "Type": "ALIYUN::ECS::Command",
  "Properties": {
    "Name": String,
    "WorkingDir": String,
    "CommandContent": String,
    "Timeout": Integer,
    "Type": String,
    "Description": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Name	String	Yes	True	The name of the command, which supports all character sets. The name can be up to 30 characters in length.	None
WorkingDir	String	Yes	True	The working directory on the ECS instance where the command will be run.	None
CommandContent	String	Yes	Released	The Base64-encoded content of the command. When you specify request parameters `Type` you must also specify this parameter. The parameter value must be Base64-encoded and cannot exceed 16 KB in size after encoding.	None
Timeout	String	No.	True	The timeout period that is specified for the command to run on ECS instances. Unit: seconds. If the command fails to run within the specified period, the command execution will time out and the process will be forcibly terminated. Default value: 3600.	None

Parameter	Type	Required	Editable	Description	Constraint
Type	String	No	No	The command type. Valid values: • RunBatScript: Creates a Bat script for a Windows instance. • RunPowerShellScript: Create a PowerShell script to run on a Windows instance. • RunShellScript: Creates a Shell script for Linux-based instances.	None
Description	String	Yes	True	The description of the command, which supports all character sets. The description can be up to 100 characters in length.	None

Response parameters

Fn::GetAtt

CommandId: the ID of the command.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "WorkingDir": {
      "Type": "String",
      "Description": "The path where command will be executed in the instance."
    },
    "CommandContent": {
      "Type": "String",
      "Description": "The content of command. Content requires base64 encoding. Maximum size support 1
6KB."
    },
    "Type": {
      "Type": "String",
      "Description": "The type of command."
    },
    "Description": {
      "Type": "String",
      "Description": "The description of command."
    },
    "Timeout": {
      "Type": "Number",
      "Description": "Total timeout when the command is executed in the instance. Input the time unit
as second. Default is 3600s."
    },
    "Name": {
      "Type": "String",
      "Description": "The name of command."
    }
  }
```

```
  },
  "Resources": {
    "Command": {
      "Type": "ALIYUN::ECS::Command",
      "Properties": {
        "WorkingDir": {
          "Ref": "WorkingDir"
        },
        "CommandContent": {
          "Ref": "CommandContent"
        },
        "Type": {
          "Ref": "Type"
        },
        "Description": {
          "Ref": "Description"
        },
        "Timeout": {
          "Ref": "Timeout"
        },
        "Name": {
          "Ref": "Name"
        }
      }
    }
  },
  "Outputs": {
    "CommandId": {
      "Description": "The id of command created.",
      "Value": {
        "Fn::GetAtt": [
          "Command",
          "CommandId"
        ]
      }
    }
  }
}
```

5.1.6.1.4. ALIYUN::ECS::CustomImage

ALIYUN::ECS::CustomImage is used to create a custom image.

Statement

```
{
  "Type": "ALIYUN::ECS::CustomImage",
  "Properties": {
    "Description": String,
    "InstanceId": String,
    "ImageName": String,
    "ImageVersion": String,
    "SnapshotId": String,
    "Tag": List,
    "ResourceGroupId": String,
    "Platform": String,
    "DiskDeviceMapping": List,
    "Architecture": String
  }
}
```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Description	String	Yes	Released	The description of the image.	The description can be up to 256 characters in length. This parameter is empty by default. It cannot start with http:// or https://.
InstanceId	String	Yes	Released	The ID of the ECS instance.	If this parameter is specified, an ECS instance will be used to create the custom image.
ImageName	String	Yes	Released	The name of the image.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), and hyphens(-). It must start with a letter but cannot start with http:// or https://.
ImageVersion	String	Yes	Released	The image version.	The image version must be 1 to 40 characters in length.
SnapshotId	String	Yes	Released	The ID of the snapshot.	• If this parameter is specified, a snapshot will be used to create the custom image. • If both this parameter and the InstanceId parameter are specified, this parameter will be ignored and an instance will be used to create the custom image.

Parameter	Type	Required or Not	Editable	Description	Constraint
Tags	List	Erased	Released	The tags of the image.	None
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the custom image belongs.	None
Platform	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Platform parameter to determine the release version of the operating system for the system disk.	None
DiskDeviceMapping	List	Erased	Released	The mappings between images and snapshots.	None
Architecture	String	Yes	Released	If you specify a data disk snapshot to be used to create the system disk of the custom image, you must use the Architecture parameter to determine the architecture of the system disk. Default value: x86_64.	Valid values: • i386 • x86_64

Tag syntax

```
"Tag": [
  {
    "Key": String,
    "Value": String
  }
]
```

Tag properties

Parameter	Type	Required or Not	Editable	Description	Constraint

Parameter	Type	Required or Not	Editable	Description	Constraint
Key	String	Yes	Released	The tag key of the image.	The tag key cannot be a null string. The key can be up to 64 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.
Value	String	Yes	Released	The tag value of the image.	The tag value can be an empty string. The value can be up to 128 characters in length. It cannot start with aliyun or acs: and cannot contain http:// or https://.

DiskDeviceMapping

```
"DiskDeviceMapping": [
  {
    "Device": String,
    "SnapshotId": String,
    "Size": Integer,
    "DiskType": String
  }
]
```

DiskDeviceMapping properties

Parameter	Type	Required or Not	Editable	Description	Constraint
Device	String	Yes	Released	The device name of disk N in the custom image.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot that is used to create the custom image.	None

Parameter	Type	Required or Not	Editable	Description	Constraint
Size	String	Optional	Released	The size of disk N. Unit: GiB.	Valid values: 5 to 2000. • The default value is the size of the snapshot specified by the DiskDeviceMapping.N.SnapshotId parameter. • If the DiskDeviceMapping.N.SnapshotId parameter is not specified, the default disk size is 5 GiB. • The disk size must be greater than or equal to the size of the snapshot specified by the DiskDeviceMapping.N.SnapshotId parameter.
DiskType	String	Yes	Released	The type of disk N in the custom image. You can specify this parameter to create the system disk of the custom image from a data disk snapshot. If you do not specify this parameter, the disk type is determined by the corresponding snapshot.	Valid values: • system: indicates a system disk. • data: indicates a data disk.

Response parameters

Fn::GetAtt

ImageId: the ID of the custom image.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",

}
```

5.1.6.1.5. ALIYUN::ECS::DedicatedHost

ALIYUN::ECS::DedicatedHost is used to create a dedicated host.

Statement

```
{
  "Type": "ALIYUN::ECS::DedicatedHost",
  "Properties": {
    "DedicatedHostType": String,
    "DedicatedHostName": String,
    "AutoReleaseTime": String,
    "Description": String,
    "AutoPlacement": String,
    "Tags": List,
    "ActionOnMaintenance": String,
    "NetworkAttributesSlbUdpTimeout": Integer,
    "ChargeType": String,
    "ResourceGroupId": String,
    "ZoneId": String,
    "NetworkAttributesUdpTimeout": Integer,
    "Quantity": Integer
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DedicatedHostType	String	No	No	The dedicated host type.	None
DedicatedHostName	String	Yes	Released	The name of the dedicated host.	• The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). • Must start with an uppercase or lowercase letter, and cannot start with `http://` or `https://` the beginning. • It can contain digits, colons (:), underscores (_), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	Yes	Released	The time scheduled for the dedicated host to be automatically released. If you do not specify the AutoReleaseTime parameter, the dedicated host will not be automatically released. • The minimum release time must be at least 30 minutes after the current time. • The maximum release time must be at most three years from the current time. • If the value of `ss` is not `00`, the start time is automatically rounded down to the nearest minute based on the value of `mm`.	None
Description	String	Yes	Released	The description of the dedicated host.	None
ZoneId	String	Yes	Released	The ID of the zone where the dedicated host resides. This parameter is empty by default. If this parameter is not specified, the system will automatically select a zone.	None
ChargeType	String	Yes	Released	The billing method of the dedicated host.	Valid values: PostPaid and pay-as-you-go.

Parameter	Type	Required	Editable	Description	Constraint
AutoPlacement	String	Yes	Released	Specifies whether to add the dedicated host to the resource pool for automatic deployment. If you do not specify a DedicatedHostId when you create an instance on a DDH, Alibaba Cloud automatically selects a DDH from the resource pool to host the instance.	Valid values: • on • off **Note** If you do not specify this parameter, the dedicated host is added to the automatic deployment resource pool. If you do not want to add the dedicated host to the resource pool for automatic deployment, set the value to off.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags are supported. The format is as follows: `[{"Key": "tagKey", "Value": "tagValue"},{"Key": "tagKey2", "Value": "tagValue2"}]`.

Parameter	Type	Required	Editable	Description	Constraint
ActionOnMaintenance	String	Yes	Released	The method used to migrate the instances on the DDH when the DDH fails or needs to be repaired online.	Valid valus: • Migrate: specifies that the instances are migrated to another physical server and restarted. • Stop: specifies that all the instances on the DDH are stopped. If the DDH cannot be repaired, the instances are migrated to another physical server and restarted. The default value is "Migrate" for a dedicated host and "Stop" for a local disk.
NetworkAttributesSlbUdpTimeout	String	Optional	Released	The timeout period for a UDP session.	Valid values: 15 to 310. Unit: seconds.
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the dedicated host belongs.	None
NetworkAttributesUdpTimeout	String	Optional	Released	The timeout period for UDP sessions that users can access for cloud services running on the dedicated host.	Valid values: 15 to 310. Unit: seconds.
Quantity	String	Optional	Released	The number of DDHs that you want to create this time.	Valid values: 1 to 100. Default value: 1

Response parameters

Fn::GetAtt

- OrderId: the ID of the order.
- DedicatedHostIds: the list of host IDs.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "AutoRenewPeriod": {
      "Type": "Number",

      }
    }
}
```

5.1.6.1.6. ALIYUN::ECS::Disk

ALIYUN::ECS::Disk is used to create an ECS Disk.

Statement

```
{
  "Type": "ALIYUN::ECS::Disk",
  "Properties": {
    "DiskName": String,
    "Description": String,
    "Tags": List,
    "AutoSnapshotPolicyId": String,
    "Encrypted": Boolean,
    "ZoneId": String,
    "ResourceGroupId": String,
    "SnapshotId": String,
    "DiskCategory": String,
    "PerformanceLevel": String,
    "DeleteAutoSnapshot": Boolean,
    "Size": Integer
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None

Parameter	Type	Required	Editable	Description	Constraint
DiskName	String	Yes	Released	The name of the disk.	• The name must be 2 to 128 characters in length • And can contain letters, digits, periods, underscores (_), and hyphens (-). • It cannot start with http:// or https://. • The disk name will be displayed in the ECS console.
Description	String	Yes	Released	The description of the disk.	• The description must be 2 to 256 characters in length. • Cannot `http://` or `https://` the beginning. • The disk description will be displayed in the ECS console.
Tags	List	Erased	Released	The custom tags of the instance.	Up to four tags are supported. Example values: `[{"Key": "tagKey", "Value": "tagValue"}, {"Key": "tagKey2", "Value": "tagValue2"}]`.
DiskCategory	String	Yes	Released	The type of the data disk.	Value range • cloud: indicates a basic disk. • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • cloud_essd: enhanced SSD (ESSD) Default value: cloud.

Parameter	Type	Required	Editable	Description	Constraint
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	• If both this parameter and 'Size' are specified, the value of this parameter prevails. • The actual size of the created disk is the size of the specified snapshot. • Snapshots created on or before July 15, 2013 cannot be used to create disks.
PerformanceLevel	String	Yes	Released	Specifies the performance level of an ESSD when you create the ESSD.	Default value: PL1. Valid values: • PL1: A single enhanced SSD delivers up to 50,000 random read/write IOPS. • PL2: A single ESSD delivers up to 100,000 random read/write IOPS. • PL3: maximum random read /write IOPS of 100,000 per disk.
Size	String	Optional	Released	The size of the disk. Unit: GiB. The value of this parameter must be equal to or greater than the capacity of the specified snapshot.	Valid values: • cloud: 5 to 2000 • cloud_efficiency: 20 to 32768 • cloud_ssd: 20 to 32768 • cloud_essd: 20 to 32768
AutoSnapshotPolicyId	String	Yes	Released	The ID of each automatic snapshot policy.	None
Encrypted	Boolean	Erased	Released	Specifies whether to encrypt the disk.	Valid values: • true • false Default value: false.

Parameter	Type	Required	Editable	Description	Constraint
DeleteAutoSnapshot	Boolean	Erased	Released	Specifies whether to delete the automatic snapshots of the disk when the disk is released.	Valid values: • true • false Default value: true.

Tags syntax

```
"Tags" : [
  {
    "Value" : String,
    "Key" : String
  }
]
```

Tags properties

Parameter	Type	Required	Editable
Key	String	No	No
Value	String	Yes	Released

Response parameters

Fn::GetAtt

- DiskId: the ID of the disk.
- Status: The Status of the disk.

Sample request

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "DataDisk": {
      "Type": "ALIYUN::ECS::Disk",
      "Properties": {
        "Size": 10,
        "ZoneId": "cn-beijing-a",
        "DiskName": "DataDisk",
        "Description": "ECSDataDisk"
      }
    }
  },
  "Outputs": {
    "DiskId": {
         "Value" : {"Fn::GetAtt": ["DataDisk","DiskId"]}
    },
    "Status": {
         "Value" : {"Fn::GetAtt": ["DataDisk","Status"]}
    }
  }
}
```

5.1.6.1.7. ALIYUN::ECS::DiskAttachment

ALIYUN::ECS::DiskAttachment is used to attach an ECS disk.

Statement

```
{
   "Type" : "ALIYUN::ECS::DiskAttachment",
   "Properties" : {
      "DiskId" : String,
      "InstanceId" : String,
      "Device" : String,
      "DeleteWithInstance" : String
   }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the instance.	None
DiskId	String	No	No	The ID of the disk.	The disk and the ECS instance must belong to the same zone.

Parameter	Type	Required	Editable	Description	Constraint
Device	String	Yes	Released	The name of the disk.	If you do not set this parameter, the system will automatically allocate a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
DeleteWithInstance	Boolean	Erased	Released	Specifies whether the disk is to be released together with the instance.	Valid values: • true: The disk will be released when the instance is released. • false: The disk will be retained when the instance is released.

Response parameters

Fn::GetAtt

- DiskId: the ID of the disk.
- Status: The Status of the disk.
- The name of the Device: disk.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "DiskAttachment": {
      "Type": "ALIYUN::ECS::DiskAttachment",

        "InstanceId": {
          "Ref": "InstanceId"
        },
        "Device": {
          "Ref": "Device"
        },
        "DeleteWithInstance": {
          "Ref": "DeleteWithInstance"
        },
        "DiskId": {
          "Ref": "DiskId"
        }
      }
    }
  },
  "Parameters": {
    "InstanceId": {
```

```
      "Type": "String",
      "Description": "The ID of the instance to attach the disk."
    },
    "Device": {
      "Type": "String",
      "Description": "The device where the volume is exposed on the instance. The device name could be
/dev/xvd[a-z]. If this parameter is not specified, the default value will be used."
    },
    "DeleteWithInstance": {
      "Type": "Boolean",
      "Description": "If this parameter is set to true, the disk will be deleted while the instance is
deleted. If this parameter is set to false, the disk will be retained after the instance is deleted.",
      "AllowedValues": [
        "True",
        "true",
        "False",
        "false"
      ]
    },
    "DiskId": {
      "Type": "String",
      "Description": "The ID of the disk to be attached."
    }
  },
  "Outputs": {
    "Status": {
      "Description": "The disk status now.",
      "Value": {
        "Fn::GetAtt": [
          "DiskAttachment",
          "Status"
        ]
      }
    },
    "Device": {
      "Description": "The device where the volume is exposed on the ECS instance.",
      "Value": {
        "Fn::GetAtt": [
          "DiskAttachment",
          "Device"
        ]
      }
    },
    "DiskId": {
      "Description": "The ID of the created disk.",
      "Value": {
        "Fn::GetAtt": [
          "DiskAttachment",
          "DiskId"
        ]
      }
    }
  }
}
```

5.1.6.1.8. ALIYUN::ECS::ForwardEntry

ALIYUN::ECS::ForwardEntry is used to configure the DNAT table of a NAT Gateway.

Statement

```
{
  "Type": "ALIYUN::ECS::ForwardEntry",
  "Properties": {
    "ExternalIp": String,
    "ExternalPort": String,
    "ForwardTableId": String,
    "InternalIp": String,
    "IpProtocol": String,
    "InternalPort": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ExternalIp	String	No	No	The public IP address of the NAT gateway.	It must be an IP address that is included in the shared NAT Gateway of the bandwidth plan to which the DNAT table belongs.
ExternalPort	String	No	No	The public port number.	Valid values: 1 to 65535.
ForwardTableId	String	No	No	The ID of the DNAT table.	None
InternalIp	String	No	No	The destination IP address to which the request is forwarded.	This IP address is a private IP address.
IpProtocol	String	No	No	The type of the protocol.	Valid values: TCP, UDP, and Any.
InternalPort	String	No	No	The destination private port.	Valid values: 1 to 65535.

Response parameters

Fn::GetAtt

ForwardEntryId: the ID of each entry in the DNAT table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ForwardEntry": {
      "Type": "ALIYUN::ECS::ForwardEntry",
      "Properties": {
        "ForwardTableId": "my_forwardtable",
        "ExternalIp": "101.201.XX.XX",
        "ExternalPort": "8080",
        "IpProtocol": "TCP",
        "InternalIp": "10.2.XX.XX",
        "InternalPort": "80"
      }
    }
  },
  "Outputs": {
    "ForwardEntryId": {
      "Value" : {"Fn::GetAttr": ["ForwardEntry","ForwardEntryId"]}
    }
  }
}
```

5.1.6.1.9. ALIYUN::ECS::Instance

ALIYUN::ECS::Instance is used to create an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::Instance",
  "Properties": {
    "RamRoleName": String,
    "IoOptimized": String,
    "PrivateIpAddress": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "Description": String,
    "Tags": List,
    "HostName": String,
    "ImageId": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "Password": String,
    "InstanceType": String,
    "SystemDiskCategory": String,
    "UserData": String,
    "SystemDiskSize": Number,
    "ZoneId": String,
    "VpcId": String,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String,
    "DiskMappings": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	No	Yes	The ID of the image used to start the ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance: • If you enter ubuntu, the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd • If you enter ubuntu_14, the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd • If you enter ubuntu*14*32, the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd • If you enter ubuntu_16_0402_32, the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd
InstanceType	String	No	No	The type of the ECS instance.	None
SecurityGroupId	String	No	No	The ID of the security group to which the created instance will belong.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	The characters in length is 8 to 30. And must contain at least one of the following character types: uppercase letters, lowercase letters, digits, and special character. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? / - / - If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.
HostName	String	Yes	Released	The hostname of the instance.	The password must be at least 2 characters in length. It cannot And hyphens (-) cannot start or end the hostname and cannot be used consecutively. On Windows, the hostname can be up to 15 characters in length and can contain letters, digits, and hyphens (-). It cannot contain periods (.) and cannot be composed of only digits. On other OSs such as Linux, the hostname can contain a maximum of 30 characters, including periods (.), each segment can contain uppercase or lowercase letters, digits, and hyphens (-).
PrivateIpAddress	String	Yes	Released	The private IP address of an ECS instance in a VPC. The specified IP address must not be used by other instances in the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet.	Valid values: 1 to 100. Default value: 100. Unit: Mbit/s.
IoOptimized	String	Yes	Released	Specifies whether an I/O optimized instance is created.	Valid values: • none (non-I/O optimized) • optimized Default value: none.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.
SystemDiskCategory	String	Yes	Released	The type of the system disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssd
SystemDiskDescription	String	Yes	Released	The description of the ECS instance system disk.	None
SystemDiskDiskName	String	Yes	Released	The name of the ECS instance system disk.	None
SystemDiskSize	Number	No.	True	The size of the system disk. Unit: GB.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags are supported. The format is as follows: `[{&ldquo;Key”:”tagKey”,”Value”:”tagValue”}, {&ldquo;Key”:”tagKey2”,”Value”:”tagValue2”}]`.
UserData	String	Yes	Released	The user data that you provide when you create ECS instances.	The user data can be up to 16KB in size. You do not need to use Base64. you must use special characters. `\` Escape.
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None

Parameter	Type	Required	Editable	Description	Constraint
HpcClusterId	String	Yes	Released	The ID of the HPC cluster to which the ECS instance belongs.	None
VpcId	String	Yes	Released	The ID of the VPC to which the ECS instance belongs.	None
VSwitchId	String	Yes	Released	The ID of the VSwitch for the ECS instance.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	• For Windows-based instances, this parameter is empty by default. • In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
DeletionProtection	Boolean	Erased	Released	The release protection property of created instances. It specifies whether the instances can be released from the ECS console or through the DeleteInstance operation.	Valid values: • True • False
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceId: the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIp: The private IP address of the instance in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC.
- InnerIp: The private IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- PublicIp: the public IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- ZoneId: the zone ID.
- HostName: the hostname of the instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::Instance",
      "Properties": {
        "ImageId": "m-25l0rc****",
        "InstanceType": "ecs.t1.small",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "Tags": [{
            "Key": "tiantt",
            "Value": "ros"
        },{
            "Key": "tiantt1",

         "Value": {"get_attr": ["WebServer","PublicIp"]}
    }
  }
}
```

5.1.6.1.10. ALIYUN::ECS::InstanceClone

ALIYUN::ECS::InstanceClone is used to clone an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::InstanceClone",
  "Properties": {
    "DeletionProtection": Boolean,
    "DiskMappings": List,
    "LoadBalancerIdToAttach": String,
    "Description": String,
    "BackendServerWeight": Integer,
    "Tags": List,
    "SecurityGroupId": String,
    "RamRoleName": String,
    "ImageId": String,
    "ResourceGroupId": String,
    "SpotPriceLimit": String,
    "InstanceChargeType": String,
    "SourceInstanceId": String,
    "Period": Number,
    "SpotStrategy": String,
    "Password": String,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "ZoneId": String,
    "KeyPairName": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth billing method, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.
BackendServerWeight	String	Optional	Released	The weight of the ECS instance in the Server Load Balancer instance.	Value range:[0, 100]. Default value: 100.
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	When editing a template, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. Take all Ubuntu public images provided by Alibaba Cloud as an example. You can use one of the following methods to specify the public image ID for the ECS instance: If you enter ubuntu, the system matches it with the following ID: ubuntu16_0402_64_20G_alibase_20170818.vhd If you enter ubuntu_14, the system matches it with the following ID: ubuntu_14_0405_64_20G_alibase_20170824.vhd If you enter ubuntu*14*32, the system matches it with the following ID: ubuntu_14_0405_32_40G_alibase_20170711.vhd If you enter ubuntu_16_0402_32, the system matches it with the following ID: ubuntu_16_0402_32_40G_alibase_20170711.vhd
SecurityGroupId	String	Yes	Released	The ID of the security group to which the created instance will belong.	None
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).

Parameter	Type	Required	Editable	Description	Constraint
Password	String	Yes	Released	The password used to log on to the ECS instance.	The password must be 8 to 30 characters in length. The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; < > , . ? / If you specify the password parameter in the API request, use HTTPS to secure the API and protect your password.
DiskMappings	List	Erased	Released	The disks to be attached to created instances.	A maximum of 16 disks can be attached to each instance.
Tags	List	Erased	Released	The custom tags of the instance.	A maximum of 20 tags can be specified in the [{"Key":"tagKey","Value":"tagValue" },{ "Key":"tagKey2","Value":"tagValue 2"}].
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
InstanceChargeType	String	Yes	Released	The billing method of the new ECS instance.	Valid values: PrePaid and PostPaid. Default value: Postpaid. If you set this parameter to Prepaid, make sure that you have sufficient balance in your account. Otherwise, the instance fails to be created.
Period	Number	Erased	Released	The subscription period of the new ECS instance. This parameter is required when the InstanceChargeType parameter is set to PrePaid. This parameter is ignored when the InstanceChargeType parameter is set to PostPaid.	Valid values: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 24, and 36. Unit: month.

Parameter	Type	Required	Editable	Description	Constraint
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to created ECS instances.	For Windows-based instances, this parameter is empty by default. In the Linux, if this parameter is specified, the Password content is still set to the instance, but the Password logon method is disabled by default. The key pair is used to verify the logon.
RamRoleName	String	Yes	Released	The RAM role name of the instance. You can call the ListRoles operation to query the role name.	None
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SpotStrategy	String	Yes	Released	The bidding policy for the pay-as-you-go instance.	This parameter is valid only when the InstanceChargeType parameter is set to PostPaid. Valid values: NoSpot: applies to regular pay-as-you-go instances. SpotWithPriceLimit: applies to preemptible instances with a maximum hourly price. SpotAsPriceGo: applies to pay-as-you-go instances priced at the market price at the time of purchase. Default value: NoSpot.
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200.
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable instance release protection in the console or by calling an API operation. (DeleteInstance) Release instances.	Valid values: true and false.

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, and ephemeral_ssd Default value: cloud.
DiskName	String	Yes	Released	Disk name.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	The description must be 2 to 256 characters in length. This parameter is empty by default.
Device	String	Yes	Released	The device name of the data disk.	If you do not specify this parameter, the system automatically allocates a device name in alphabetical order from /dev/xvdb to /dev/xvdz.
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	The tag key, which cannot be an empty string. It can be up to 64 characters in length, cannot start with acs: or aliyun, and cannot contain http:// or https://.	None
Value	String	Yes	Released	The tag value, which can be an empty string. It can be up to 128 characters in length and cannot start with acs: or aliyun. It cannot contain http:// or https://.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceId: the ID of the instance. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIp: The private IP address of the instance in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC.
- InnerIp: The private IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- PublicIp: the public IP address of the instance in a Classic network. This parameter takes effect only when the NetworkType parameter is set to Classic.
- ZoneId: the zone ID.
- HostName: the hostname of the instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceClone",
      "Properties": {
        "SourceInstanceId": "i-25zsk****",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",

         "Value": {"get_attr": ["WebServer","PublicIp"]}
    }
  }
}
```

5.1.6.1.11. ALIYUN::ECS::InstanceGroup

ALIYUN::ECS::InstanceGroup is used to create an ECS instance group.

Syntax

```
{
  "Type": "ALIYUN::ECS::InstanceGroup",
  "Properties": {
    "SystemDiskAutoSnapshotPolicyId": String,
    "DedicatedHostId": String,
    "LaunchTemplateName": String,
    "RamRoleName": String,
    "IoOptimized": String,
    "PrivateIpAddress": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "Description": String,
    "Tags": List,
    "HostName": String,
    "ImageId": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "EniMappings": List,
    "Password": String,
    "InstanceType": String,
    "MaxAmount": Integer,
    "AutoReleaseTime": String,
    "SystemDiskCategory": String,
    "UserData": String,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "SystemDiskSize": Number,
    "ZoneId": String,
    "VpcId": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "Ipv6AddressCount": Integer,
    "SecurityGroupId": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String,
    "Ipv6Addresses": List,
    "NetworkType": String,
    "DiskMappings": List,
    "SystemDiskPerformanceLevel": String
  }
}
```

Properties

Attribute	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	Yes	The ID of the resource group to which a created instance belongs.	None.

Attribute	Type	Required	Editable	Description	Constraint
HpcClusterId	String	No	Yes	The ID of the HPC cluster to which a created instance belongs.	None.
MaxAmount	Integer	Supported	Yes	The maximum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of MinAmount.
MinAmount	String	Yes	Yes	The minimum number of ECS instances that can be created at a time.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of MaxAmount.
Description	String	No	Yes	The description of created instances.	The description can be up to 256 characters in length.
InstanceType	String	Yes	Yes	The type of the ECS instance.	None.
ImageId	String	Yes	Yes	The ID of the image used to start an ECS instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	You can specify a partial public image ID instead of providing the complete ID. The following example shows how to use a CNAME record: • Ubuntu is specified and ubuntu_16_0402_64_20G_alibase_20170818.vhd are matched. • If ubuntu1432 is specified, ubuntu_14_0405_32_40G_alibase_20170711.vhd is matched.
SecurityGroupId	String	No	No	The ID of the security group to which created instances belong.	None.

Attribute	Type	Required	Editable	Description	Constraint
InstanceName	String	No	No	The name of an instance.	The names can be up to 128 characters in length It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-). By `name_prefix[begin_number,bits]name_suffix` format to specify different instance name for each ECS instance.
Password	String	No	Yes	The password used to log on to created ECS instances.	• The password must be 8 to 30 characters in length • and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. • The following special characters are supported `:( ) '~ ! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? /` If you specify the Password parameter in the API request, use HTTPS to secure the API and protect your password.
HostName	String	No	No	The hostname of created ECS instances.	The hostname must contain at least two characters in length. The periods and hyphens (-) cannot start or end the hostname and cannot be used together.
AutoReleaseTime	String	No	No	The time scheduled for created ECS instances to be automatically released.	The time format must comply with ISO8601 specifications, for example, `"yyyy-MM-ddTHH:mm:ssZ"`. The maximum release time must be within three years from the current time.

Attribute	Type	Required	Editable	Description	Constraint
PrivateIpAddress	String	No	No	The private IP address of an ECS instance in a VPC.	The specified IP address must not be used by other instances in the VPC.
DiskMappings	List	No	Yes	The data disks to be attached to created instances.	None.
InternetMaxBandwidthIn	Integer	No	No	The maximum inbound bandwidth from the Internet.	Unit: Mbit/s. Valid values: 1 to 100 Default value: 100.
IoOptimized	String	No	No	Specifies whether the created instances are I/O optimized.	Valid values: • none (non-I/O optimized) • optimized Default value: none.
SystemDiskCategory	String	No	Yes	The category of the system disk.	Valid values: cloud: basic disk cloud_efficiency: the ultra disk cloud_ssd: standard SSDs cloud_essd: enhanced SSD ephemeral_ssd: local SSDs
SystemDiskDescription	String	No	Yes	The description of the ECS instance system disk.	None.
SystemDiskDiskName	String	No	Yes	The name of the ECS instance system disk.	None.
SystemDiskSize	Number	No	Yes	The size of the system disk.	Valid values: 40 to 500. If a custom image is used to create a system disk, make sure that the size of the system disk is greater than that of the custom image.

Attribute	Type	Required	Editable	Description	Constraint
Tags	List	No	Yes	The custom tags of a created instance.	A maximum of 20 tags are supported. The format is as follows: `[{"Key":"tagKey","Value":"tagValue"},{"Key":"tagKey2","Value":"tagValue2"}]`.
UserData	String	No	Yes	The user data that you provide when you create ECS instances.	The user data can be up to 16 KB in size. You do not need to use Base64 for transcoding. Special characters need to be escaped.
ZoneId	String	No	No	The zone ID of the disk.	None.
VpcId	String	No	No	The ID of the VPC.	None.
VSwitchId	String	No	No	The ID of the VSwitch for the ECS instance.	None.
KeyPairName	String	No	Yes	The name of the key pair that is used to connect to created ECS instances.	For Windows-based ECS instances, this parameter is ignored. and it is empty by default. For Linux-based ECS instances, the Password parameter still takes effect if this parameter is specified. However, logon by password is disabled, and the KeyPairName value is used.
RamRoleName	String	No	Yes	The name of the instance RAM role.	You can call the ListRoles operation to query the role name.
DedicatedHostId	String	No	No	The ID of the dedicated host.	None.
LaunchTemplateName	String	No	Yes	The name of the launch template for the instance.	None.

Attribute	Type	Required	Editable	Description	Constraint
EniMappings	List	No	Yes	The elastic network interfaces (ENIs) to be attached to created instances.	Only one ENI can be attached to each instance.
LaunchTemplateId	String	No	Yes	The ID of the launch template.	None.
LaunchTemplateVersion	String	No	Yes	The version of the launch template.	If you do not specify a version, the default version is used.
NetworkType	String	No	No	The network type of created ECS instances.	Valid values: • vpc • classic Default value: classic.
DeletionProtection	Boolean	No	No	The release protection attribute of the instance. It specifies whether you can use the ECS console or call the DeleteInstance operation to release the instance.	Valid values: • true • false
DeploymentSetId	String	No	Yes	Deployment Set ID.	None.

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "PerformanceLevel": String,
    "AutoSnapshotPolicyId": String
  }
]
```

DiskMappings properties

Attribute	Type	Required	Editable	Description	Constraint
Size	String	Yes	No	The size of a data disk.	Unit: GB.
Category	String	No	No	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • cloud_essd • ephemeral_ssd For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DiskName	String	No	No	The name of data disk N.	The name can be up to 128 characters in length. It can contain English letters, Chinese characters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	No	No	The description of data disk N.	The description must be 2 to 256 characters in length. The description cannot start with `http://` or `https://`.
Device	String	No	No	The device name of the data disk.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	No	No	The ID of the snapshot.	None.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	Valid values: • true • false Default value: false
KMSKeyId	String	No	No	The ID of the KMS key corresponding to the data disk.	None.
AutoSnapshotPolicyId	String	No	Yes	The ID of the automatic snapshot policy.	None.

Attribute	Type	Required	Editable	Description	Constraint
PerformanceLevel	String	No	No	The performance level of the enhanced SSD used as the data disk.	• (Default): Maximum random read /write IOPS of 50,000 per disk • PL2: A single enhanced SSD delivers up to 100,000 random read/write IOPS. • PL3: A single enhanced SSD delivers up to 1,000,000 random read/write IOPS.

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Attribute	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	The key of tag N.	It must be 1 to 128 characters in length, and cannot start with `aliyun` and `acs:` beginning, cannot contain `http://` or `https://` .
Value	String	No	No	The value of tag N.	It must be 0 to 128 characters in length and cannot start with `aliyun` and `acs:` beginning, cannot contain `http://` or `https://` .

EniMappings syntax

```
"EniMappings": [
  {
    "SecurityGroupId": String,
    "VSwitchId": String,
    "Description": String,
    "NetworkInterfaceName": String,
    "PrimaryIpAddress": String
  }
]
```

EniMappings properties

Attribute	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	Yes	The ID of the security group to which an instance belongs.	The security group and the instance must be in the same VPC.
VSwitchId	String	Yes	No	The ID of the VSwitch to which the instance is connected.	None.
Description	String	No	Yes	The description of the ENI.	It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` or `https://` the beginning.
NetworkInterfaceName	String	No	Yes	The ENI name.	• The name must be 2 to 128 characters in length • Must start with an uppercase or lowercase letter, and cannot start with `http://` or `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
PrimaryIpAddress	String	No	No	The primary private IP address of ENI N.	The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block will be selected at random.

Return value

Fn::GetAtt

- InstanceIds: the IDs of created instances in the ECS instance group. An ID is a system-generated globally unique identifier (GUID) for an instance.
- PrivateIps: the list of private IP addresses of instances in a VPC. This parameter takes effect only when the NetworkType parameter is set to VPC. For example, a Json-formatted Array: `["172.16.XX.XX", "172.16.XX.XX",&hellip; "172.16.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- InnerIps: the list of private IP addresses of instances in a classic network. This parameter takes effect only when

the NetworkType parameter is set to Classic. For example, a Json-formatted Array: `["10.1.XX.XX", "10.1.XX.XX",&hellip; "10.1.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).

- PublicIps: the list of public IP addresses of instances in a classic network. This parameter takes effect only when the NetworkType parameter is set to Classic. For example, a Json-formatted Array: `["42.1.XX.XX", "42.1.XX.XX",&hellip; "42.1.XX.XX"]` the maximum number of IP addresses that can be specified. Separate multiple IP addresses with commas (,).
- HostNames: the list of hostnames of all instances.
- OrderId: the list of order IDs of all instances.
- ZoneIds: the IDs of the zones where created instances reside.
- RelatedOrderIds: the list of related order IDs of created ECS instances.

Examples

```
{
  "ROSTemplateFormatVersion":"2015-09-01",
  "Resources":{
    "WebServer": {

    }
  }
}
```

5.1.6.1.12. ALIYUN::ECS::InstanceGroupClone

ALIYUN::ECS::InstanceGroupClone is used to clone an ECS instance group.

Statement

```
{
  "Type": "ALIYUN::ECS::InstanceGroupClone",
  "Properties": {
    "BackendServerWeight": Integer,
    "DiskMappings": List,
    "LaunchTemplateName": String,
    "SpotPriceLimit": String,
    "ResourceGroupId": String,
    "KeyPairName": String,
    "SystemDiskDiskName": String,
    "PeriodUnit": String,
    "Description": String,
    "Tags": List,
    "ImageId": String,
    "SpotStrategy": String,
    "SourceInstanceId": String,
    "EniMappings": List,
    "Password": String,
    "MaxAmount": Integer,
    "AutoReleaseTime": String,
    "SystemDiskCategory": String,
    "LoadBalancerIdToAttach": String,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "ZoneId": String,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "DeletionProtection": Boolean,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "RamRoleName": String,
    "HpcClusterId": String,
    "SystemDiskDescription": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the enterprise resource group to which a created instance belongs.	None
HpcClusterId	String	Yes	True	The ID of the E-HPC cluster to which a created instance belongs.	None
SourceInstanceId	String	No	No	The ID of the ECS instance to be cloned.	The clone operation clones the specified instance, including its instance type, image, bandwidth limit, and network type. If the source ECS instance belongs to multiple security groups, the cloned instance is added only to the first of these security groups.

Parameter	Type	Required	Editable	Description	Constraint
MaxAmount	Integer	Retained	Yes	The maximum number of ECS instances to be created.	Valid values: 1 to 100. The MaxAmount parameter must be set to a value greater than or equal to the value of the MinAmount parameter.
MinAmount	String	No	Yes	The minimum number of ECS instances to be created.	Valid values: 1 to 100. The MinAmount parameter must be set to a value less than or equal to the value of the MaxAmount parameter.
BackendServerWeight	String	Optional	Released	The weight assigned to the ECS instance in the Server Load Balancer instance.	Valid values: 0 to 100. Default value: 100.
LoadBalancerIdToAttach	String	Yes	Released	The ID of the SLB instance to which the ECS instance is to be attached.	None
Description	String	Yes	Released	The description of created instances.	The description can be up to 256 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
ImageId	String	Yes	True	The ID of the image used to start created instances. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	You can specify a partial public image ID instead of providing the complete ID. When editing a template used to deploy an ECS instance, you can specify the image type and version or only the image type. ROS automatically selects an appropriate public image ID. You can use the wildcard character (*) to represent part of an image ID. You can use one of the following methods to specify the public image ID for the ECS instance: • If you set the parameter to ubuntu, ubuntu_16_0402_64_20G_alibase_20170818.vhd. • If this parameter is set to ubuntu_14, ubuntu_14_0405_64_20G_alibase_20170824.vhd is returned. • Specify: ubuntu1432, which will eventually match: ubuntu_14_0405_32_40G_alibase_20170711.vhd • Specify: ubuntu_16_0402_32, which will eventually match: ubuntu_16_0402_32_40G_alibase_20170711.vhd
SecurityGroupId	String	Yes	Released	The ID of the security group to which created instances belong.	None
InstanceName	String	Yes	Released	The name of a created instance.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Password	String	Yes	Released	The password used to log on to the ECS instance.	The password The password must be 8 to 30 characters in length and must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special character. Special characters include ( ) ` ~ ! @ # $ % ^ & * - + = | { } [ ] : ; ' < > , . ? / If the Password parameter is specified, you must use HTTPS to call the operation to ensure that the Password remains confidential.
DiskMappings	List	Erased	Released	The data disks to be attached to the instance.	A maximum of 16 disks can be attached to each instance.
Tags	List	Erased	Released	The custom tags of the instance.	You can specify a maximum of 20 tags. The format is as follows: `[{"Key":"tagKey","Value":"tagValue"},{"Key":"tagKey2","Value":"tagValue2"}]`.

Parameter	Type	Required	Editable	Description	Constraint
ZoneId	String	Yes	Released	The ID of the zone where the instance resides.	None
KeyPairName	String	Yes	Released	The name of the key pair that is used to connect to the ECS instance. For Windows-based ECS instances, this parameter is ignored. Default value: empty. For Linux-based instances, the Password parameter still takes effect if this parameter is specified. However, logon by Password is disabled, and the KeyPairName value is used.	None
RamRoleName	String	Yes	Released	The RAM role name of the instance.	You can use RAM API ListRoles you can call this operation to query the RAM role name of an instance.
SpotPriceLimit	String	Yes	Released	The maximum hourly price of the instance.	This parameter supports up to three decimal places. Parameter SpotStrategy this parameter takes effect only when the value is SpotWithPriceLimit.
SystemDiskDiskName	String	Yes	True	The name of the system disk of created instances.	The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with `http://` or `https://` and can contain digits, colons (:), underscores (_), and hyphens (-).
PeriodUnit	String	Yes	True	The billing cycle for created ECS instances.	Valid values: • Week. 1, 2, 3, and 4} when the value of the PeriodUnit parameter is Week. AutoRenewPeriod values are 1, 2, "3"}. • Month 1, 2, 3, 4, 5, 6, and 7 when the PeriodUnit parameter is set to Month "8", "9", "12", "24", "36", "48", "60"},AutoRenewPeriod can be {"1", "2", "3", "6", "12"}. Default value: Month.
EniMappings	List	No.	True	The elastic network interfaces (ENIs) to be attached to a created instance.	Only a single ENI can be attached to each instance.

Parameter	Type	Required	Editable	Description	Constraint
AutoReleaseTime	String	Yes	Released	The time scheduled for a created ECS instance to be automatically released. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. in the yyyy-MM-ddTHH:mm:ssZ format. The time must be in UTC. • If the value of seconds (ss) is a value other than 00, the start time is automatically rounded down to the nearest minute based on the value of mm. • The minimum release time must be at least 30 minutes later than the current time. • The maximum release time must be at most three years from the current time. If you do not specify the AutoReleaseTime it indicates that the auto release feature is disabled and the ECS instance will not be automatically released.	None

Parameter	Type	Required	Editable	Description	Constraint
SystemDiskCategory	String	Yes	True	The type of the system disk.	Valid values: • cloud: basic disk • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • ephemeral_ssd: local SSD. • cloud_essd: indicates an enhanced SSD (ESSD). ESSDs are still in public preview and only available in some regions. For phased-out instance types that are not I/O optimized, the default value is cloud. For other instances, the default value is cloud_efficiency.
LaunchTemplateName	String	Yes	True	The name of the launch template.	None
LaunchTemplateVersion	String	Yes	True	The version of the launch template. If you do not specify this parameter, the default version is used.	None
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet. Unit: Mbit/s.	Valid values: 1 to 200. Default value: 200.
LaunchTemplateId	String	Yes	True	The ID of the launch template.	None
SystemDiskDescription	String	Yes	True	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with http:// or https://. This parameter is empty by default.
DeletionProtection	Boolean	Erased	Released	The release protection attribute of the instance. Specifies whether the ECS console or API DeleteInstance) to release the instance.	Valid values: • true • false
DeploymentSetId	String	Yes	True	Deployment Set ID.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint
Encrypted	String	Yes	Released	Specifies whether to encrypt the data disk.	Valid values: • true • false Default value :false
KMSKeyId	String	Yes	Released	The KMS key ID for data disk N.	None
Size	String	No	No	The size of data disk N. Unit: GB.	None
Category	String	Yes	Released	The type of the data disk.	Valid values: • cloud • cloud_efficiency • cloud_ssd • ephemeral_ssdDefault
DiskName	String	Yes	Released	The name of data disk N.	The name can be up to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-).
Description	String	Yes	Released	The description of data disk N.	Valid values: 2 to 256. Default value: Null.
Device	String	Yes	Released	The device name of the data disk attached to an ECS instance.	The system allocates a device name in alphabetical order from /dev/xvda to /dev/xvdz.
SnapshotId	String	Yes	Released	Create a data disk by using a snapshot.	None

EniMappings syntax

```
"EniMappings": [
  {
    "SecurityGroupId": String,
    "VSwitchId": String,
    "Description": String,
    "NetworkInterfaceName": String,
    "PrimaryIpAddress": String
  }
]
```

EniMappings properties

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	Yes	The ID of the security group to which the ENI belongs.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
Description	String	Yes	True	The description of the ENI.	It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` and `https://` the beginning.
NetworkInterface Name	String	Yes	True	The name of the ENI.	None
PrimaryIpAddress	String	Yes	Released	The primary IP address of the ENI.	None

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None

Parameter	Type	Required	Editable	Description	Constraint
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- InstanceIds: the IDs of instances in the ECS instance group. An ID is a globally unique identifier (GUID) generated by the system for an instance.
- PrivateIps: the private IP addresses of VPC-type instances. This parameter is valid only when the NetworkType parameter is set to VPC. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["172.16.XX.XX", "172.16.XX.XX", ... "172.16.XX.XX"].
- InnerIps: the private IP addresses of instances in the classic network. This parameter is valid only when the NetworkType parameter is set to Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["10.1.XX.XX", "10.1.XX.XX", ... "10.1.XX.XX"].
- PublicIps: the public IP addresses of instances in the classic network. This parameter is applicable only when the NetworkType parameter is set is Classic. The parameter value is a JSON-formatted array, containing up to 100 IP addresses separated by commas (,). Example: ["42.1.XX.XX", "42.1.XX.XX", ... "42.1.XX.XX"].
- HostNames: the hostnames of all instances. The parameter value is a JSON-formatted array. Example: ["host1", "host2", ... "host3"].
- OrderId: the order IDs of all instances.
- ZoneIds: the IDs of the zones where created instances reside.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WebServer": {
      "Type": "ALIYUN::ECS::InstanceGroupClone",
      "Properties": {
        "SourceInstanceId": "i-25zsk****",
        "ImageId": "m-25l0r****",
        "SecurityGroupId": "sg-25zwc****",
        "ZoneId": "cn-beijing-b",
        "MaxAmount": 1,
        "MinAmount": 1
      }
    }
  },
  "Outputs": {
    "InstanceIds": {
      "Value": {"get_attr": ["WebServer","InstanceIds"]}
    },
    "PublicIps": {
      "Value": {"get_attr": ["WebServer","PublicIps"]}
    }
  }
}
```

5.1.6.1.13. ALIYUN::ECS::Invocation

ALIYUN::ECS::Invocation is used to invoke a Cloud Assistant command for one or more ECS instances.

Statement

```
{
  "Type": "ALIYUN::ECS::Invocation",
  "Properties": {
    "Timed": Boolean,
    "Frequency": String,
    "CommandId": String,
    "InstanceIds": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Timed	Boolean	Erased	Released	Specifies whether to invoke the command on a periodic basis. Default value: false.	None
Frequency	String	Yes	Released	The frequency at which the command is invoked.	None

Parameter	Type	Required	Editable	Description	Constraint
CommandId	String	No	No	The ID of the script.	None
InstanceIds	List	Yes	No	The IDs of the instances for which you want to invoke the command. A maximum of 20 instance IDs can be specified.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

The execution ID of the InvokeId: command.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Timed": {
      "Type": "Boolean",
      "Description": "Whether it is timed execution. Default is False.",
      "AllowedValues": [
        "True",
        "true",
        "False",
        "false"
      ]
    },
    "Frequency": {
      "Type": "String",
      "Description": "The frequency of timing execution (the shortest frequency is performed every 1 minute). It is mandatory when Timing is True.The value rule follows the rules of the cron expression. "
    },
    "CommandId": {
      "Type": "String",
      "Description": "The id of command."
    },
    "InstanceIds": {
      "Type": "CommaDelimitedList",
      "Description": "The instance id list. Select up to 20 instances at a time.Instances selected network type must be VPC network, status must be running"
    }
  },
  "Resources": {
    "Invocation": {
      "Type": "ALIYUN::ECS::Invocation",
      "Properties": {
        "Timed": {
          "Ref": "Timed"
        },
        "Frequency": {
          "Ref": "Frequency"
```

```
            "Ref": "Frequency"
          },
          "CommandId": {
            "Ref": "CommandId"
          },
          "InstanceIds": {
            "Fn::Split": [
              ",",
              {
                "Ref": "InstanceIds"
              },
              {
                "Ref": "InstanceIds"
              }
            ]
          }
        }
      }
    },
    "Outputs": {
      "InvokeId": {
        "Description": "The id of command execution.",
        "Value": {
          "Fn::GetAtt": [
            "Invocation",
            "InvokeId"
          ]
        }
      }
    }
}
```

5.1.6.1.14. ALIYUN::ECS::JoinSecurityGroup

ALIYUN::ECS::JoinSecurityGroup is used to add one or more ECS instances to a specified security group.

Syntax

```
{
  "Type": "ALIYUN::ECS::JoinSecurityGroup",
  "Properties": {
    "InstanceId": String,
    "InstanceIdList": List,
    "SecurityGroupId": String,
    "NetworkInterfaceList": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	No	The ID of the security group.	None

Property	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the ECS instance to be added to the security group.	None
InstanceIdList	List	No	Yes	The IDs of the ECS instances to be added to the security group.	None
NetworkInterfaceList	List	No	Yes	The IDs of the elastic network interfaces (ENIs).	None

Response parameters

Fn::GetAtt

None

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SG": {
      "Type": "ALIYUN::ECS::JoinSecurityGroup",
      "Properties": {
        "SecurityGroupId": "sg-m5eagh7rzys2z8sa****",
        "InstanceIdList": [
          "i-m5e505h9bgsio0wy****",
          "i-m5e505hio0wyjc6r****"
        ]
      }
    }
  }
}
```

`YAML` format

```
ROSTemplateFormatVersion: '2015-09-01'
Resources:
  SG:
    Type: ALIYUN::ECS::JoinSecurityGroup
    Properties:
      SecurityGroupId: sg-m5eagh7rzys2z8sa****
      InstanceIdList:
      - i-m5e505h9bgsio0wy****
      - i-m5e505hio0wyjc6r****
```

5.1.6.1.15. ALIYUN::ECS::LaunchTemplate

ALIYUN::ECS::LaunchTemplate is used to create an ECS instance launch template.

Syntax

```
{
  "Type": "ALIYUN::ECS::LaunchTemplate",
  "Properties": {
    "LaunchTemplateName": String,
    "VersionDescription": String,
    "ImageId": String,
    "InstanceType": String,
    "SecurityGroupId": String,
    "NetworkType": String,
    "VSwitchId": String,
    "InstanceName": String,
    "Description": String,
    "InternetMaxBandwidthIn": Integer,
    "InternetMaxBandwidthOut": Integer,
    "HostName": String,
    "ZoneId": String,
    "SystemDiskCategory": String,
    "SystemDiskSize": Number,
    "SystemDiskDiskName": String,
    "SystemDiskDescription": String,
    "IoOptimized": String,
    "InternetChargeType": String,
    "UserData": String,
    "KeyPairName": String,
    "RamRoleName": String,
    "AutoReleaseTime": String,
    "SpotStrategy": String,
    "SpotPriceLimit": String,
    "SecurityEnhancementStrategy": String,
    "DiskMappings": List,
    "NetworkInterfaces": List,
    "Tags": List,
    "TemplateTags": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
LaunchTemplateName	String	Yes	No	The name of the instance launch template.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`. • It can contain letters, digits, colons (:), underscores (_), and hyphens (-).

Property	Type	Required	Editable	Description	Constraint
VersionDescription	String	No	No	The description of the version of the instance launch template.	• The description must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
ImageId	String	No	No	The ID of the image.	None
InstanceType	String	No	No	The type of the instance.	None
SecurityGroupId	String	No	No	The ID of the security group.	None
NetworkType	String	No	No	The network type of the instance.	Valid values: • classic • vpc
VSwitchId	String	No	No	The ID of the VSwitch. You must specify this parameter when you create an instance in a VPC.	None
InstanceName	String	No	No	The name of the instance.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
Description	String	No	No	The description of the instance.	• The description must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`.
InternetMaxBandwidthIn	Integer	No	No	Maximum inbound bandwidth from the Internet.	Valid values: 1 to 200. Unit: Mbit/s.
InternetMaxBandwidthOut	Integer	No	No	Maximum outbound bandwidth to the Internet.	Valid values: 0 to 100. Unit: Mbit/s.

Property	Type	Required	Editable	Description	Constraint
HostName	String	No	No	The hostname of the instance.	The name cannot start or end with a period (.) or a hyphen (-). It cannot contain consecutive periods (.) or hyphens (-). • For Windows instances: ◦ The name must be 2 to 15 characters in length and can contain letters, digits, and hyphens (-). ◦ It cannot only contain digits. • For other instances such as Linux instances: ◦ The name must be 2 to 64 characters in length and can contain letters, digits, and hyphens (-).
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
SystemDiskCategory	String	No	No	The category of the system disk.	Valid values: • cloud: the basic disk • cloud_efficiency: the ultra disk • cloud_ssd: the standard SSD • ephemeral_ssd: the local SSD
SystemDiskSize	Number	No	No	The size of the system disk.	Valid values: 20 to 500. Unit: GiB.
SystemDiskDiskName	String	No	No	The name of the system disk.	• The name must be 2 to 128 characters in length and can contain letters, digits, colons (:), underscores (_), and hyphens (-). • It must start with a letter but cannot start with `http://` or `https://`.

Property	Type	Required	Editable	Description	Constraint
SystemDiskDescription	String	No	No	The description of the system disk.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.
IoOptimized	String	No	No	Specifies whether the instance is I/O optimized.	Valid values: • none • optimized
InternetChargeType	String	No	No	The billing method for network usage.	Valid values: • PayByBandwidth • PayByTraffic
UserData	String	No	No	The user data of the instance.	The data must be encoded in Base64. The maximum size of the raw data is 16 KB.
KeyPairName	String	No	No	The AccessKey pair name.	• For Windows instances, this parameter is ignored and is empty by default. The Password parameter takes effect even if the KeyPairName parameter is specified. • For Linux instances, the username and password authentication method is disabled by default.
RamRoleName	String	No	No	The RAM role name of the instance.	None
AutoReleaseTime	String	No	No	The time scheduled for the instance to be automatically released.	Specify the time in the ISO 8601 standard in the `yyyy-MM-ddTHH:mm:ssZ` format. The time must be in UTC.

Property	Type	Required	Editable	Description	Constraint
SpotStrategy	String	No	No	The preemption policy for pay-as-you-go instances.	This parameter takes effect only when the InstanceChargeType parameter is set to PostPaid. Valid values: • NoSpot: The instance is created as a regular pay-as-you-go instance. • SpotWithPriceLimit: The instance to be created is a preemptible instance with a user-defined maximum hourly price. • SpotAsPriceGo: The instance to be created is a preemptible instance whose price is based on the market price at the time of purchase.
SpotPriceLimit	String	No	No	The maximum hourly price of the instance.	A maximum of three decimal places can be specified.
SecurityEnhancementStrategy	String	No	No	Specifies whether to enable security hardening.	Valid values: • Active: enables security hardening. • Deactive: disables security hardening.
DiskMappings	List	No	No	The list of data disks.	A maximum of 16 data disks can be specified.
NetworkInterfaces	List	No	No	The list of elastic network interfaces (ENIs).	A maximum of eight ENIs can be specified.
Tags	List	No	No	The tags of the instance, security group, disks, and ENIs.	A maximum of 20 tags can be specified.
TemplateTags	List	No	No	The tags of the launch template.	A maximum of 20 tags can be specified.

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "DiskName": String,
    "Description": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "DeleteWithInstance": String
  }
]
```

DiskMappings properties

Property	Type	Required	Editable	Description	Constraint
Category	String	No	No	The category of the data disk.	Valid values: • cloud: the basic disk • cloud_efficiency: the ultra disk • cloud_ssd: the standard SSD • ephemeral_ssd: the local SSD
DiskName	String	No	No	The name of the data disk.	• The name must be 2 to 128 characters in length. • It must start with a letter but cannot start with `http://` or `https://`. • It can contain letters, digits, colons (:), underscores (_), and hyphens (-).
Description	String	No	No	The description of the data disk.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.
SnapshotId	String	No	No	The ID of the snapshot used to create the data disk.	None

Property	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of the system disk.	• Valid values when the Category parameter is set to cloud: 5 to 2000. • Valid values when the Category parameter is set to cloud_efficiency: 20 to 32768. • Valid values when the Category parameter is set to cloud_ssd: 20 to 32768. • Valid values when the Category parameter is set to ephemeral_ssd: 5 to 800. Unit: GiB.
Encrypted	Boolean	No	No	Specifies whether to encrypt the data disk.	None
DeleteWithInstance	Boolean	No	No	Specifies whether to release the data disk when the instance is released.	None

NetworkInterfaces syntax

```
"NetworkInterfaces": [
  {
    "PrimaryIpAddress": String,
    "VSwitchId": String,
    "SecurityGroupId": String,
    "NetworkInterfaceName": String,
    "Description": String
  }
]
```

NetworkInterfaces properties

Property	Type	Required	Editable	Description	Constraint
PrimaryIpAddress	String	No	No	The primary private IP address of the ENI.	None
VSwitchId	String	No	No	The ID of the VSwitch to which the ENI belongs.	None
SecurityGroupId	String	No	No	The ID of the security group to which the ENI belongs.	None
NetworkInterfaceName	String	No	No	The name of the ENI.	None

Property	Type	Required	Editable	Description	Constraint
Description	String	No	No	The description of the ENI.	The description must be 2 to 256 characters in length and cannot start with `http://` or `https://`.

Tags syntax

```
"Tags": [
  {
    "Value": String,
    "Key": String
  }
]
```

Tags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

TemplateTags syntax

```
"TemplateTags": [
  {
    "Value": String,
    "Key": String
  }
]
```

TemplateTags properties

Property	Type	Required	Editable	Description	Constraint
key	String	Yes	No	None	None
value	String	No	No	None	None

Response parameters

Fn::GetAtt

- LaunchTemplateId: the ID of the instance launch template.
- LaunchTemplateName: the name of the instance launch template.
- DefaultVersionNumber: the default version number of the instance launch template.
- LatestVersionNumber: the latest version number of the instance launch template.

5.1.6.1.16. ALIYUN::ECS::NatGateway

ALIYUN::ECS::NatGateway is used to create a NAT Gateway for a VPC.

Statement

```
{
  "Type": "ALIYUN::ECS::NatGateway",
  "Properties": {
    "DeletionProtection": Boolean,
    "VpcId": String,
    "Description": String,
    "NatGatewayName": String,
    "VSwitchId": String,
    "DeletionForce": Boolean,
    "Spec": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	Yse	No	The ID of the VPC that you want to create NAT Gateway.	None
VSwitchId	String	Yse	No	The ID of the vSwitch in the specified VPC.	None
Description	String	Erased	Released	The description of the NAT Gateway.	The description must be 2 to 256 characters in length.
NatGatewayName	String	Erased	Released	The name of the NAT Gateway.	The name must be 2 to 128 characters in length and can contain letters, digits, underscores (_), periods (.), and hyphens (-). It must start with a letter.
Spec	String	Erased	Released	The type of the NAT Gateway.	Valid values: Small,Middle, and Large.
DeletionProtection	Boolean	Erased	Released	Indicates whether deletion protection is enabled. Default value: false.	None
DeletionForce	Boolean	Erased	Released	Specifies whether to forcibly delete SNAT and DNAT entries in the Gateway and unbind EIP from the NAT gateway. Default value: false.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- ForwardTableId: the ID of the port forwarding table.
- The ID of the SNatTableId:SNat source network address translation table.
- NatGatewayId: the unique ID of the Nat gateway.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "NatGateway": {
      "Type": "ALIYUN::ECS::NatGateway",
      "Properties": {
        "NatGatewayName": "nat_gateway_1",
        "Description": "my nat gateway",
        "VpcId": "vpc-25o8s****",
        "VSwitchId": "vsw-25rc1****",
        "Spec": "Small"
      }
    }
  },
  "Outputs": {
    "NatGatewayId": {
         "Value": {"Fn::GetAttr": ["NatGateway","NatGatewayId"]}
    },
    "ForwardTableId": {
         "Value": {"Fn::GetAttr": ["NatGateway","ForwardTableId"]}
    },
    "SNatTableId": {
         "Value": {"Fn::GetAttr": ["NatGateway", "SNatTableId"]}
    }
  }
}
```

5.1.6.1.17. ALIYUN::ECS::NetworkInterface

ALIYUN::ECS::NetworkInterface is used to create an elastic network interface (ENI).

Statement

```
{
  "Type": "ALIYUN::ECS::NetworkInterface",
  "Properties": {
    "Description": String,
    "SecurityGroupId": String,
    "PrimaryIpAddress": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "NetworkInterfaceName": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	No	Yes	The ID of the security group to which the instance belongs. The security group and the instance must be in the same VPC.	None
VSwitchId	String	No	No	The ID of the VSwitch in the VPC.	None
Description	String	Yes	True	The description of the ENI. It can contain 2 to 256 English letters or Chinese character. It cannot start with `http://` and `https://` the beginning. This parameter is empty by default.	None

Parameter	Type	Required	Editable	Description	Constraint
NetworkInterfaceName	String	Yes	True	The name of the ENI. The name must be 2 to 128 characters in length Must start with an uppercase or lowercase letter, and cannot start with `http://` and `https://` the beginning. It can contain letters, digits, colons (:), underscores (_), and hyphens (-). Default value: null.	None
PrimaryIpAddress	String	Yes	Released	The primary private IP address of the ENI. The specified IP address must be available within the CIDR block of the VSwitch. If this parameter is not specified, an available IP address in the VSwitch CIDR block is assigned at random.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- NetworkInterfaceId: the ID of the ENI.
- The MAC address of the MacAddress: Elastic Network Interface.

- The private IP address of the PrivateIpAddress: Elastic Network Interface.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Description": {
      "Type": "String",
      "Description": "Description of your ENI. It is a string of [2, 256] English or Chinese characters."
    },
    "SecurityGroupId": {
      "Type": "String",
      "Description": "The ID of the security group that the ENI joins. The security group and the ENI must be in a same VPC."
    },
    "VSwitchId": {
      "Type": "String",
      "Description": "VSwitch ID of the specified VPC. Specifies the switch ID for the VPC."
    },
    "NetworkInterfaceName": {
      "Type": "String",
      "Description": "Name of your ENI. It is a string of [2, 128]  Chinese or English characters. It must begin with a letter and can contain numbers, underscores (_), colons (:), or hyphens (-)."
    },
    "PrimaryIpAddress": {
      "Type": "String",
      "Description": "The primary private IP address of the ENI.  The specified IP address must have the same Host ID as the VSwitch. If no IP addresses are specified, a random network ID is assigned for the ENI."
    }
  },
  "Resources": {
    "EniInstance": {
      "Type": "ALIYUN::ECS::NetworkInterface",
      "Properties": {
        "Description": {
          "Ref": "Description"
        },
        "SecurityGroupId": {
          "Ref": "SecurityGroupId"
        },
        "VSwitchId": {
          "Ref": "VSwitchId"
        },
        "NetworkInterfaceName": {
          "Ref": "NetworkInterfaceName"
        },
        "PrimaryIpAddress": {
          "Ref": "PrimaryIpAddress"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfaceId": {
      "Description": "ID of your Network Interface.",
      "Value": {
        "Fn::GetAtt": [
```

```
            "EniInstance",
            "NetworkInterfaceId"
          ]
        }
      }
    }
}
```

5.1.6.1.18. ALIYUN::ECS::NetworkInterfaceAttachment

ALIYUN::ECS::NetworkInterfaceAttachment is used to attach an elastic network interface (ENI) to an instance in a VPC.

Statement

```
{
  "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
  "Properties": {
    "InstanceId": String,
    "NetworkInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	No	The ID of the RDS instance.	None
NetworkInterfaceId	String	No	No	The IDs of the elastic network interfaces (ENIs).	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

NetworkInterfaceId: the ID of the ENI.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "InstanceId": {
      "Type": "String",
      "Description": "ECS instance id"
    },
    "NetworkInterfaceId": {
      "Type": "String",
      "Description": "Network interface id"
    }
  },
  "Resources": {
    "EniAttachment": {
      "Type": "ALIYUN::ECS::NetworkInterfaceAttachment",
      "Properties": {
        "InstanceId": {
          "Ref": "InstanceId"
        },
        "NetworkInterfaceId": {
          "Ref": "NetworkInterfaceId"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfaceId": {
      "Description": "ID of your Network Interface.",
      "Value": {
        "Fn::GetAtt": [
          "EniAttachment",
          "NetworkInterfaceId"
        ]
      }
    }
  }
}
```

5.1.6.1.19. ALIYUN::ECS::NetworkInterfacePermission

ALIYUN::ECS::NetworkInterfacePermission is used to grant an account the permission to attach an elastic network interface (ENI) to an instance.

Syntax

```
{
  "Type": "ALIYUN::ECS::NetworkInterfacePermission",
  "Properties": {
    "NetworkInterfaceId": String,
    "AccountId": String,
    "Permission": String
  }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
NetworkInterfaceId	String	Yes	No	The ID of the ENI.	None
AccountId	String	Yes	No	The ID of the account.	None
Permission	String	Yes	No	The permission granted to the account.	None

Response parameters

Fn::GetAtt

- NetworkInterfacePermissionId: the ID of the ENI permission.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "AccountId": {
      "Type": "String",
      "Description": "the account id"
    },
    "Permission": {
      "Type": "String",
      "Description": "the permission",
      "Default": "InstanceAttach"
    },
    "NetworkInterfaceId": {
      "Type": "String",
      "Description": "Network interface id"
    }
  },
  "Resources": {
    "EniPermission": {
      "Type": "ALIYUN::ECS::NetworkInterfacePermission",
      "Properties": {
        "AccountId": {
          "Ref": "AccountId"
        },
        "Permission": {
          "Ref": "Permission"
        },
        "NetworkInterfaceId": {
          "Ref": "NetworkInterfaceId"
        }
      }
    }
  },
  "Outputs": {
    "NetworkInterfacePermissionId": {
      "Description": "the network interface permission id",
      "Value": {
        "Fn::GetAtt": [
          "EniPermission",
          "NetworkInterfacePermissionId"
        ]
      }
    }
  }
}
```

5.1.6.1.20. ALIYUN::ECS::Route

ALIYUN::ECS::Route is used to create a custom route.

Syntax

```
{
  "Type": "ALIYUN::ECS::Route",
  "Properties": {
    "DestinationCidrBlock": String,
    "RouteTableId": String,
    "NextHopId": String,
    "NextHopType": String,
    "RouteId": String,
    "NextHopList": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
DestinationCidrBlock	String	Yes	No	The destination Classless Inter-Domain Routing (CIDR) block of the route entry.	None
RouteTableId	String	Yes	No	The ID of the route table.	None
NextHopId	String	No	No	The ID of the next-hop instance of the route entry.	The route is a non-ECMP route.
RouteId	String	Yes	No	The ID of the route.	None
NextHopType	String	No	No	The type of the next hop.	Default value: Instance. Valid values: • Instance • Tunnel • HaVip • RouterInterface

Property	Type	Required	Editable	Description	Constraint
NextHopList	List	No	No	The list of next hops of the route entry.	You must specify the NextHopType and NextHopId parameters to specify the next hops. • If you specify the NextHopList parameter, the route is an ECMP route. The list contains two to four next hops of the ECMP route entry. **Note** The NextHopList parameter can be specified only when the route entry belongs to a VRouter. In addition, the next hops must be the router interfaces pointing to the connected VBRs. • If you do not specify the NextHopList parameter, the route is a non-ECMP route.

NextHopList syntax

```
"NextHopList": [
  {
    "NextHopId": String,
    "NextHopType": String
  }
]
```

NextHopList properties

Property	Type	Required	Editable	Description	Constraint
NextHopId	String	Yes	No	The ID of the next-hop instance of the route entry.	None
NextHopType	String	No	No	The type of the next hop.	Default value: RouterInterface. Valid values: • Instance • Tunnel • HaVip • RouterInterface

Response parameters

Fn::GetAtt

None

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ECSRoute": {
      "Type": "ALIYUN::ECS::Route",
      "Properties": {
 "RouteId": "vrt-25mz0****",
        "RouteTableId": "vtb-25oud****",
        "DestinationCidrBlock": "172.16.XX.XX/24",
        "NextHopId": "i-25xzy****"
      }
    }
  }
}
```

5.1.6.1.21. ALIYUN::ECS::SNatEntry

ALIYUN::ECS::SNatEntry is used to configure a NAT Gateway table in a source network address translation.

Statement

```
{
  "Type": "ALIYUN::ECS::SNatEntry",
  "Properties": {
    "SNatTableId": String,
    "SNatIp": String,
    "SourceVSwitchId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
SNatTableId	String	Retained	Yes	The ID source network address translation table.	None
SNatIp	String	Retained	Yes	The public IP address used to source network address translation.	The public IP address must be NAT Gateway in the bandwidth plan. It cannot exist in both the forwarding table and the SNAT table.

Parameter	Type	Required	Editable	Description	Constraint
SourceVSwitchId	String	Retained	Yes	The ID of the VSwitch that accesses the Internet through the SNAT function of NAT Gateway.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

SNatEntryId: the table entry ID in the source network address translation table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SNatEntry": {
      "Type": "ALIYUN::ECS::SNatEntry",
      "Properties": {
        "SNatTableId": "stb-3er41****",
        "SourceVSwitchId": "vsw-25rc1****",
        "SNatIp": "101.201.XX.XX"
      }
    }
  },
  "Outputs": {
    "SNatEntryId": {
         "Value": {"Fn::GetAttr": ["SNatEntry","SNatEntryId"]}
    }
}
```

5.1.6.1.22. ALIYUN::ECS::SecurityGroup

ALIYUN::ECS::SecurityGroup is used to create a security group.

Statement

```
{
  "Type": "ALIYUN::ECS::SecurityGroup",
  "Properties": {
    "VpcId": String,
    "Description": String,
    "SecurityGroupName": String,
    "Tags": List,
    "SecurityGroupEgress": List,
    "SecurityGroupIngress": List,
    "ResourceGroupId": String,
    "SecurityGroupType": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcId	String	Yes	Released	The ID of the VPC.	None
Description	String	Yes	Released	The description of the new security group.	The description must be 2 to 256 characters in length.
Tags	List	Erased	Released	The tags of the security group.	A maximum of 20 tags can be specified.
SecurityGroupName	String	Yes	Released	The name of the new security group.	Default value: empty. • The name must be 2 to 128 characters in length • Must start with an uppercase or lowercase letter, and cannot start with `http://` and `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
SecurityGroupEgress	List	Erased	Released	The outbound access rules of the security group.	None
SecurityGroupIngress	List	Erased	Released	The inbound access rules of the security group.	None

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupType	String	Yes	Released	The type of the new security group.	Valid values: • normal (basic security group) • enterprise (Advanced Security Group)

Tags syntax

```
"Tags": [
  {
    "Value" : String,
    "Key" : String
  }
]
```

Tags properties

Parameter	Type	Required	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	None

SecurityGroupEgress syntax

```
"SecurityGroupEgress": [
  {
    "Description": String,
    "PortRange": String,
    "SecurityGroupId": String,
    "NicType": String,
    "Priority": Integer,
    "DestGroupId": String,
    "DestCidrIp": String,
    "Policy": String,
    "IpProtocol": String,
    "DestGroupOwnerAccount": String,
    "DestGroupOwnerId": String,
    "Ipv6DestCidrIp": String
  }
]
```

SecurityGroupEgress properties

Parameter	Type	Required	Editable	Description	Constraint
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.

Parameter	Type	Required	Editable	Description	Constraint
DestGroupOwnerId	String	Yes	Released	The ID of the Alibaba Cloud account that owns the destination security group. This parameter is used to grant the current security group access to security groups in another Alibaba Cloud account.	If neither the DestGroupOwnerId parameter nor the DestGroupOwnerAccount parameter is specified, the current security group is granted access to other security groups in the same Alibaba Cloud account. If the DestCidrIp parameter is specified, the DestGroupOwnerId parameter is ignored.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: • TCP • udp • icmp • GRE • All A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	The range of destination ports corresponding to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to all, the port number range is -1/-1.

Parameter	Type	Required	Editable	Description	Constraint
SecurityGroupId	String	Yes	Released	The ID of the security group for which to create the outbound access rules.	None
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: • internet • intranet Default value: internet.
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1
DestGroupId	String	Yes	Released	The ID of the destination security group within the same region.	You must specify either the DestGroupId parameter or the DestCidrIp parameter. If both parameters are specified, the system authorizes the destination CIDR block specified by the DestCidrIp parameter. If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, you must set the NicType parameter to intranet.

Parameter	Type	Required	Editable	Description	Constraint
DestCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 addresses are supported.
Policy	String	Yes	Released	The authorization policy.	Valid values: • accept: grants access • drop: denies access Default value: accept.
DestGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Ipv6DestCidrIp	String	Yes	Released	The destination IPv6 CIDR block.	IPv6 addresses in CIDR format are supported. You can only specify the IP addresses for ECS instances in VPCs.

SecurityGroupIngress syntax

```
"SecurityGroupIngress": [
  {
    "SourceGroupOwnerId": String,
    "SourceGroupOwnerAccount": String,
    "Description": String,
    "PortRange": String,
    "SecurityGroupId": String,
    "NicType": String,
    "Ipv6SourceCidrIp": String,
    "Priority": Integer,
    "SourceGroupId": String,
    "Policy": String,
    "IpProtocol": String,
    "SourcePortRange": String,
    "SourceCidrIp": String
  }
]
```

SecurityGroupIngress properties

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupOwnerId	String	Yes	Released	The ID of the Alibaba Cloud account that owns the source security group.	None
Description	String	Yes	Released	The description of the security group rule.	The description must be 1 to 512 characters in length.
IpProtocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: tcp, udp, icmp, gre, and all. A value of all specifies that all the four protocols are supported.

Parameter	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	Released	The range of port numbers corresponding to the Internet protocol.	The range of destination ports corresponding to the transport layer protocol. Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • When the IpProtocol parameter is set to all, the port number range is -1/-1, indicating that all ports are available.

Parameter	Type	Required	Editable	Description	Constraint
SourceGroupId	String	Yes	Released	The ID of the source security group within the same region.	You must specify either the SourceGroupId parameter or the SourceCidrIp parameter. If both parameters are specified, the system authorizes the source CIDR block specified by the SourceCidrIp parameter. If the SourceGroupId parameter is specified, but the SourceCidrIp parameter is not, you must set the NicType parameter to intranet.
SecurityGroupId	String	Yes	Released	The ID of the security group for which you want to create the inbound access rule.	None
NicType	String	Yes	Released	The network type of the instance. Valid values:	Valid values: • internet • intranet Default value: internet.
SourceGroupOwnerAccount	String	Yes	Released	The Alibaba Cloud account of the destination security group when you grant security group permissions across accounts.	None
Priority	String	Optional	Released	The priority of the authorization policy.	Valid values: 1 to 100. Default value: 1

Parameter	Type	Required	Editable	Description	Constraint
SourceCidrIp	String	Yes	Released	The source IPv4 CIDR block.	The value must be in CIDR format. The default value is 0.0.0.0/0, indicating that access from any IP addresses is allowed. Examples of other supported formats include 10.159.XX.XX/12. Only IPv4 CIDR blocks are supported.
Policy	String	Yes	Released	The authorization policy.	Valid values: • accept: accepts the request. • drop: access is denied. Default value: accept.

Parameter	Type	Required	Editable	Description	Constraint
SourcePortRange	String	Yes	Released	The range of source ports relevant to transport layer protocols.	Valid values: • When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1, indicating that all values are valid. • When the IpProtocol parameter is set to gre, the port number range is -1/-1, indicating that all ports are available. • The IpProtocol value is all:-1/-1.
Ipv6SourceCidrIp	String	Yes	Released	The source IPv6 CIDR block. IPv6 addresses in CIDR format are supported.	You can only specify the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

Sample request

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "SG": {
      "Type": "ALIYUN::ECS::SecurityGroup",

}
```

5.1.6.1.23. ALIYUN::ECS::SecurityGroupClone

ALIYUN::ECS::SecurityGroupClone is used to clone a security group.

Syntax

```
{
  "Type": "ALIYUN::ECS::SecurityGroupClone",
  "Properties": {
    "DestinationRegionId": String,
    "VpcId": String,
    "Description": String,
    "SecurityGroupName": String,
    "SourceSecurityGroupId": String,
    "ResourceGroupId": String,
    "NetworkType": String,
    "SecurityGroupType": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group to which the instance belongs.	None
SourceSecurityGroupId	String	Yes	No	The ID of the source security group.	Only applicable security group rules are copied to the new security group. The security group rules are selected based on the network type of the new security group.
NetworkType	String	No	No	The network type of the new security group.	Set the value to Classic.
VpcId	String	No	No	The ID of the VPC to which the new security group belongs.	The NetworkType parameter is ignored if both the VpcId and NetworkType parameters are specified.
Description	String	No	No	The description of the new security group.	The description must be 2 to 256 characters in length. It cannot start with http:// or https://.

Property	Type	Required	Editable	Description	Constraint
SecurityGroupName	String	No	No	The name of the new security group.	This parameter is empty by default. The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It must start with a letter and cannot start with http:// or https://.
DestinationRegionId	String	No	No	The ID of the destination region where the new security group resides.	Default value: CURRENT.
SecurityGroupType	String	No	No	The type of the new security group.	Valid values: normal and enterprise. A value of normal specifies a basic security group. A value of enterprise specifies an advanced security group.

Response parameters

Fn::GetAtt

SecurityGroupId: the ID of the new security group.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SecurityGroupClone": {
      "Type": "ALIYUN::ECS::SecurityGroupClone",
      "Properties": {
        "SourceSecurityGroupId": {
          "Ref": "SourceSecurityGroupId"
        },
        "VpcId": {
          "Ref": "VpcId"
        },
        "Description": {
          "Ref": "Description"
        },
        "SecurityGroupName": {
```

```
          "Ref": "SecurityGroupName"
        },
        "DestinationRegionId": {
          "Ref": "DestinationRegionId"
        },
        "NetworkType": {
          "Ref": "NetworkType"
        }
      }
    }
  },
  "Parameters": {
    "SourceSecurityGroupId": {
      "Type": "String",
      "Description": "Source security group ID is used to copy properties to clone new security group. If the NetworkType and VpcId is not specified, the same security group will be cloned. If NetworkType or VpcId is specified, only proper security group rules will be cloned."
    },
    "VpcId": {
      "Type": "String",
      "Description": "Physical ID of the VPC."
    },
    "Description": {
      "Type": "String",
      "Description": "Description of the security group, [2, 256] characters. Do not fill or empty, the default is empty."
    },
    "SecurityGroupName": {
      "Type": "String",
      "Description": "Display name of the security group, [2, 128] English or Chinese characters, must start with a letter or Chinese in size, can contain numbers, '_' or '.', '-'"
    },
    "DestinationRegionId": {
      "Default": "CURRENT",
      "Type": "String",
      "Description": "Clone security group to the specified region. Default to current region."
    },

    "SecurityGroupId": {
      "Description": "Generated security group id of new security group.",
      "Value": {
        "Fn::GetAtt": [
          "SecurityGroupClone",
          "SecurityGroupId"
        ]
      }
    }
  }
}
```

5.1.6.1.24. ALIYUN::ECS::SecurityGroupEgress

ALIYUN::ECS::SecurityGroupEgress is used to create an outbound access rule for a security group.

Syntax

```
{
  "Type": "ALIYUN::ECS::SecurityGroupEgress",
  "Properties": {
    "SecurityGroupId": String,
    "IpProtocol": String,
    "PortRange": String,
    "DestGroupId": String,
    "DestGroupOwnerAccount": String,
    "DestCidrIp": String,
    "Policy": String,
    "Priority": String,
    "NicType": String,
    "Ipv6DestCidrIp": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
IpProtocol	String	Yes	No	The transport layer protocol.	Valid values: • tcp • udp • icmp • gre • all **Note** The value all indicates that all the four protocols are supported.

Property	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	No	The range of destination port numbers corresponding to the transport layer protocol.	• Valid values when IpProtocol is set to tcp or udp: 1 to 65535. Separate the starting and ending port numbers with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • Set the value to -1/-1 when IpProtocol is set to icmp. • Set the value to -1/-1 when IpProtocol is set to gre. • Set the value to -1/-1 when IpProtocol is set to all.
SecurityGroupId	String	No	No	The ID of the source security group.	None
NicType	String	No	No	The type of the network interface controller (NIC).	Default value: internet. Valid values: • internet • intranet If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, set the value to intranet.
Priority	Integer	No	No	The priority of the security group rule.	Valid values: 1 to 100 Default value: 1.

Property	Type	Required	Editable	Description	Constraint
DestGroupId	String	No	No	The ID of the destination security group for which you want to set access permissions.	You must specify at least one of the DestGroupId and DestCidrIp parameters. If the DestGroupId parameter is specified, but the DestCidrIp parameter is not, set the NicType value to intranet. If both the DestGroupId and DestCidrIp parameters are specified, the DestCidrIp parameter takes precedence.
DestCidrIp	String	No	No	The destination CIDR block.	Only IPv4 CIDR blocks are supported.
Policy	String	No	No	The authorization policy.	Default value: accept. Valid values: • accept: allows access. • drop: denies access.
DestGroupOwnerAccount	String	No	No	The Alibaba Cloud account that manages the destination security group when you set a security group rule across accounts.	If you specify neither of the DestGroupOwnerAccount parameter nor the DestGroupOwnerId parameter, the access permission is configured on another security group managed by your account. If you specify the DestCidrIp parameter, the DestGroupOwnerAccount parameter is ignored.

Property	Type	Required	Editable	Description	Constraint
Description	String	No	Yes	The description of the security group rule.	The description must be 1 to 512 characters in length.
DestGroupOwnerId	String	No	No	The ID of the Alibaba Cloud account that manages the destination security group when you set a security group rule across accounts.	If you specify neither of the DestGroupOwnerAccount parameter nor the DestGroupOwnerId parameter, the access permission is configured on another security group managed by your account. If you specify the DestCidrIp parameter, the DestGroupOwnerId parameter is ignored.
Ipv6DestCidrIp	String	No	No	The destination IPv6 CIDR block.	IPv6 addresses in the CIDR format are supported. You can specify only the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

None

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SG": {
      "Type": "ALIYUN::ECS::SecurityGroupEgress",
      "Properties": {
        "SecurityGroupId": "sg-25bow****",
        "IpProtocol": "tcp",
        "PortRange": "65535/65535",
        "DestCidrIp": "0.0.0.0/0"
      }
    }
  }
}
```

5.1.6.1.25. ALIYUN::ECS::SecurityGroupIngress

ALIYUN::ECS::SecurityGroupIngress is used to create an inbound access rule for a security group.

Syntax

```
{
  "Type": "ALIYUN::ECS::SecurityGroupIngress",
  "Properties": {
    "SourceGroupOwnerId": String,
    "Description": String,
    "PortRange": String,
    "SecurityGroupId": String,
    "NicType": String,
    "Ipv6SourceCidrIp": String,
    "Priority": Integer,
    "SourceGroupId": String,
    "Policy": String,
    "IpProtocol": String,
    "SourcePortRange": String,
    "SourceCidrIp": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
IpProtocol	String	Yes	No	The Internet protocol.	Valid values: tcp, udp, icmp, gre, and all. A value of all specifies that all the four protocols are supported.

Property	Type	Required	Editable	Description	Constraint
PortRange	String	Yes	No	The range of destination ports relevant to transport layer protocols.	• When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1. • When the IpProtocol parameter is set to gre, the port number range is -1/-1. • When the IpProtocol parameter is set to all, the port number range is -1/-1.

Property	Type	Required	Editable	Description	Constraint
SourceGroupId	String	No	No	The ID of the source security group for which you want to set access permissions.	You must specify at least one of the SourceGroupId and SourceCidrIp parameters. If the SourceGroupId parameter is specified, but the SourceCidrIp parameter is not, the NicType parameter must be set to intranet. If both the SourceGroupId and SourceCidrIp parameters are specified, the SourceCidrIp value is used by default.
SecurityGroupId	String	No	No	The ID of the security group for which you want to create the inbound access rule.	None
NicType	String	No	No	The network type of the instance.	Valid values: • internet • intranet Default value: internet.
SourceGroupOwnerAccount	String	No	No	The Alibaba Cloud account that manages the source security group when you set a security group rule across accounts.	If neither the SourceGroupOwnerAccount parameter nor the SourceGroupOwnerId parameter is specified, the access permission is configured for another security group managed by your account. If the SourceCidrIp parameter is specified, this parameter is ignored.

Property	Type	Required	Editable	Description	Constraint
Priority	Integer	No	No	The priority of the security group rule.	Valid values: 1 to 100. Default value: 1.
SourceCidrIp	String	No	No	The source IPv4 CIDR block.	Only IPv4 CIDR blocks are supported.
Policy	String	No	No	The access control policy.	Valid values: • accept: grants access. • drop: denies access. Default value: accept.
SourceGroupOwnerId	String	No	No	The ID of the Alibaba Cloud account that manages the source security group when you set a security group rule across accounts.	If neither the SourceGroupOwnerId parameter nor the SourceGroupOwnerAccount parameter is specified, the access permission is configured for another security group managed by your account. If the SourceCidrIp parameter is specified, this parameter is ignored.
Description	String	No	Yes	The description of the security group rule.	The description must be 1 to 512 characters in length.

Property	Type	Required	Editable	Description	Constraint
SourcePortRange	String	No	No	The range of source ports relevant to transport layer protocols.	• When the IpProtocol parameter is set to tcp or udp, the port number range is 1 to 65535. Separate the starting port and the ending port with a forward slash (/). Correct example: 1/200. Incorrect example: 200/1. • When the IpProtocol parameter is set to icmp, the port number range is -1/-1. • When the IpProtocol parameter is set to gre, the port number range is -1/-1. • When the IpProtocol parameter is set to all, the port number range is -1/-1.
Ipv6SourceCidrIp	String	No	No	The range of source IPv6 addresses.	CIDR blocks and IPv6 addresses are supported. You can only specify the IP addresses of ECS instances in VPCs.

Response parameters

Fn::GetAtt

None

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SG": {
      "Type": "ALIYUN::ECS::SecurityGroupIngress",
      "Properties": {
        "SecurityGroupId": "sg-25bow****",
        "IpProtocol": "tcp",
        "PortRange": "65535/65535",
        "SourceCidrIp": "0.0.0.0/0"
      }
    }
  }
}
```

5.1.6.1.26. ALIYUN::ECS::Snapshot

ALIYUN::ECS::Snapshot is used to create a disk Snapshot.

Statement

```
{
  "Type": "ALIYUN::ECS::Snapshot",
  "Properties": {
    "SnapshotName": String,
    "Timeout": Integer,
    "Description": String,
    "DiskId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DiskId	String	No	No	The ID of the disk for which you want to create the snapshot.	None

Parameter	Type	Required	Editable	Description	Constraint
SnapshotName	String	Yes	Released	The name of the snapshot.	It must be 2 to 128 characters in length. And can contain letters, digits, underscores (_), and hyphens (-). It cannot start with auto. Snapshot names starting with auto are reserved for automatic snapshots. It cannot start with `http://` or `https://`.
Timeout	String	Optional	Released	The timeout period that is specified for the snapshot creation request.	If this parameter is set, the timeout period to create a resource stack is prolonged. If the snapshot is not created within the specified time period, the entire resource stack fails to be created. You must set the timeout period according to the disk size and data amount. Valid values: 200 to 1440. Unit: minute. The default value is 200 minutes.
Description	String	Yes	Released	The description of the snapshot.	The length must be 2 to 256 characters in length. This parameter is empty by default. It cannot start with `http://` or `https://`.

Response parameters

Fn::GetAtt

SnapshotId: the ID of the snapshot.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Snapshot": {
      "Type": "ALIYUN::ECS::Snapshot",
      "Properties": {
        "DiskId": "d-2zedgvuvu8cylvrd****"
      }
    }
  },
  "Outputs": {
    "SnapshotId": {
      "Value": {
        "Fn::GetAtt": [
          "Snapshot",
          "SnapshotId"
        ]
      }
    }
  }
}
```

5.1.6.1.27. ALIYUN::ECS::SSHKeyPair

ALIYUN::ECS::SSHKeyPair is used to create or import an SSH key pair to an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::SSHKeyPair",
  "Properties": {
    "ResourceGroupId": String,
    "KeyPairName": String,
    "PublicKeyBody": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
KeyPairName	String	No	No	The globally unique name of the SSH key pair.	The name must be 2 to 128 characters in length and can contain letters, digits, periods (.), underscores (_), and hyphens (-). It cannot start with `http://` or `https://`.
PublicKeyBody	String	Yes	Released	Specifies the SSH public key to import.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- KeyPairFingerPrint: the fingerprint of the key pair. The message-digest algorithm 5 (MD5) is used based on the public key fingerprint format defined in RFC 4716.
- PrivateKeyBody: the private key of the key pair. An unencrypted RSA private key must be encoded using PEM and must be in the PKCS#8 format. The private key of a key pair can only be obtained at the time of its creation. If you import an existing public key, no private key information will be available.
- KeyPairName: the globally unique name of the SSH key pair.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SSHKeyPair": {
      "Type": "ALIYUN::ECS::SSHKeyPair",
      "Properties": {
        "KeyPairName": "ssh_key_pair_v1"
      }
    }
  },
  "Outputs": {
    "KeyPairName": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "KeyPairName"
        ]
      }
    },
    "PrivateKeyBody": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "PrivateKeyBody"
        ]
      }
    },
    "KeyPairFingerPrint": {
      "Value": {
        "Fn::GetAtt": [
          "SSHKeyPair",
          "KeyPairFingerPrint"
        ]
      }
    }
  }
}
```

5.1.6.1.28. ALIYUN::ECS::SSHKeyPairAttachment

ALIYUN::ECS::SSHKeyPairAttachment is used to bind an SSH key pair to an ECS instance.

Statement

```
{
  "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
  "Properties": {
    "InstanceIds": List,
    "KeyPairName": String
  }
}
```

Properties

Parameter	Type	Required or Not	Editable	Description	Constraint
InstanceIds	List	Retained	Yes	The IDs of the ECS instances with which you want to associate the EIP.	Separate the IDs with a comma (,). Only Linux instances are supported.
KeyPairName	String	No	No	The name of the SSH key pair.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "SSHKeyPairAttachment": {
      "Type": "ALIYUN::ECS::SSHKeyPairAttachment",
      "Properties": {
        "KeyPairName": "ssh_key_pair_v1",
        "InstanceIds": [
          'I-2zeiofnh20hj**** has been added * ',
          'I-2zebt3kfvxm2**** has two records *'
        ]
      }
    }
  }
}
```

5.1.6.1.29. ALIYUN::ECS::VPC

ALIYUN::ECS::VPC is used to create a VPC.

Statement

```
{
  "Type": "ALIYUN::ECS::VPC",
  "Properties": {
    "Description": String,
    "Ipv6CidrBlock": String,
    "EnableIpv6": Boolean,
    "ResourceGroupId": String,
    "VpcName": String,
    "CidrBlock": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the instance belongs.	None
VpcName	String	Yes	True	The name of the VPC.	• The name must be 2 to 128 characters in length • Must start with english letters or starts with a Chinese character. • It cannot start with `http://` or `https://`. • It must start with a letter and cannot start with http:// or https://.
CidrBlock	String	Yes	True	The CIDR block of the VPC.	Valid values: 10.0.0.0/8, 172.16.0.0/12, and 192.168.0.0/16.
Description	String	Yes	True	The description of the VPC.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://`.

Parameter	Type	Required	Editable	Description	Constraint
Ipv6CidrBlock	String	Yes	Released	The IPv6 CIDR block of the VPC.	None
EnableIpv6	Boolean	No.	True	Specifies whether to enable an IPv6 CIDR block.	Valid values: • true • false Default value: false.

Response parameters

Fn::GetAtt

- VpcId: The VPC ID allocated by the system.
- VRouterId: the ID of the vRouter.
- RouteTableId: the ID of the routing table.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "EcsVpc": {
      "Type": "ALIYUN::ECS::VPC",
      "Properties": {
        "CidrBlock": "172.16.0.0/12",
        "VpcName": "vpc-test-del"
      }
    }
  },
  "Outputs": {
    "VpcId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "VpcId"
        ]
      }
    },
    "VRouterId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "VRouterId"
        ]
      }
    },
    "RouteTableId": {
      "Value": {
        "Fn::GetAtt": [
          "EcsVpc",
          "RouteTableId"
        ]
      }
    }
  }
}
```

5.1.6.1.30. ALIYUN::ECS::VSwitch

ALIYUN::ECS::VSwitch is used to create a VSwitch.

Statement

```
{
  "Type": "ALIYUN::ECS::VSwitch",
  "Properties": {
    "VSwitchName": String,
    "VpcId": String,
    "Description": String,
    "Ipv6CidrBlock": Integer,
    "ZoneId": String,
    "CidrBlock": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VpcId	String	No	No	The ID of the VPC where a vSwitch is to be created	None
ZoneId	String	No	No	The ID of the zone where the instance resides.	None
VSwitchName	String	Yes	True	The name of the VSwitch.	• The name must be 2 to 128 characters in length • It must start with a letter. • Cannot `http://` or `https://` the beginning. • It must start with a letter and cannot start with http:// or https://.
CidrBlock	String	No	No	The CIDR block of the VSwitch.	The VSwitch CIDR block must be a subset of the CIDR block assigned to the VPC where the VSwitch resides and not be used by other VSwitches.
Description	String	Yes	True	The description of the vSwitch.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://`.
Ipv6CidrBlock	String	Optional	Released	The IPv6 CIDR block of the VSwitch. You can customize the last eight bits of the IPv6 CIDR block.	Valid values: 0 to 255. The value is a decimal integer. By default, the prefix of the IPv6 CIDR block of the VSwitch is set to /64.

Response parameters

Fn::GetAtt

- VSwitchId: indicates the vSwitch ID allocated by the system.
- CidrBlock: the IPv4 CIDR block of the vSwitch.
- Ipv6CidrBlock: the IPv6 CIDR block of the vSwitch.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "VpcName": {
      "Type": "String"
    },
    "VSwitch1CidrBlock": {
      "Type": "String",
      "Default": "172.16.100.0/24"
    },
    "VSwitch2CidrBlock": {

```

5.1.6.2. ESS

5.1.6.2.1. ALIYUN::ESS::AlarmTask

ALIYUN::ESS::AlarmTask is used to create a metric-based alarm task.

Syntax

```
{
  "Type": "ALIYUN::ESS::AlarmTask",
  "Properties": {
    "Statistics": String,
    "Name": String,
    "EvaluationCount": Integer,
    "Period": Integer,
    "MetricType": String,
    "ComparisonOperator": String,
    "Dimensions": List,
    "ScalingGroupId": String,
    "AlarmAction": List,
    "Threshold": Number,
    "MetricName": String,
    "GroupId": Integer,
    "Description": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
Statistics	String	No	No	The method used to calculate monitoring data. The statistics must be appropriate for the metric chosen.	Valid values: Average, Minimum, and Maximum. Default value: Average.
Name	String	No	Yes	The name of the alarm rule.	None
EvaluationCount	Integer	No	No	The number of consecutive times that the threshold must be exceeded before an alarm is triggered.	Default value: 3. Minimum value: 1.
Period	Integer	No	No	The metric query period, which must be appropriate for the metric chosen. Unit: seconds.	Valid values: 60, 120, 300, and 900. Default value: 300.
MetricType	String	No	No	The metric type.	Valid values: system and custom.
ComparisonOperator	String	No	No	The alarm comparison operator used to define a condition in the alarm rule.	Valid values: <=, <, >, and > =.
Dimensions	List	No	No	The list of instances associated with the alarm rule.	You must include at least one instance in the list.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
AlarmAction	List	Yes	Yes	The list of alarm actions.	You must include one to five alarm actions in the list.
Threshold	Number	Yes	No	The alarm threshold, which must be a numeric value.	None
MetricName	String	Yes	No	The metric name of a service. For more information, see the metrics defined for each service.	None
GroupId	Integer	No	No	The group ID.	None
Description	String	No	Yes	The description of the alarm task.	None

Dimensions syntax

```
"Dimensions": [
  {
    "DimensionKey": String,
    "DimensionValue": String
  }
]
```

Dimensions properties

Property	Type	Required	Editable	Description	Constraint
DimensionValue	String	Yes	No	None	None
DimensionKey	String	Yes	No	None	None

Response parameters

Fn::GetAtt

AlarmTaskId: the ID of the alarm task.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "ComparisonOperator": {
      "Type": "String",
      "Description": "Comparison Operator",
      "AllowedValues": [
        ">=",
        "<=",
        ">",
```

```
        "<"
      ]
    },
    "Description": {
      "Type": "String",
      "Description": "Description"
    },
    "ScalingGroupId": {

        ]
      }
    }
  }
}
```

5.1.6.2.2. ALIYUN::ESS::AlarmTaskEnable

ALIYUN::ESS::AlarmTaskEnable is used to start an alarm task. You can call this operation to enable alarm tasks when the task is stopped.

Statement

```
{
  "Type": "ALIYUN::ESS::AlarmTaskEnable",
  "Properties": {
    "AlarmTaskId": String,
    "Enable": Boolean
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AlarmTaskId	String	No	No	The ID of the monitoring task.	None

Parameter	Type	Required	Editable	Description	Constraint
Enable	String	Retained	Yes	Specifies whether to enable the alarm task.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Enable": {
      "Type": "Boolean",

5.1.6.2.3. ALIYUN::ESS::LifecycleHook

ALIYUN::ESS::LifecycleHook is used to create a lifecycle hook for a scaling group.

Syntax

```
{
  "Type": "ALIYUN::ESS::LifecycleHook",
  "Properties": {
    "LifecycleHookName": String,
    "NotificationArn": String,
    "HeartbeatTimeout": Integer,
    "NotificationMetadata": String,
    "ScalingGroupId": String,
    "DefaultResult": String,
    "LifecycleTransition": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
LifecycleHookName	String	No	Yes	The name of the lifecycle hook. Each lifecycle hook name must be unique within a scaling group.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The default name is the ID of the lifecycle hook.
NotificationArn	String	No	Yes	The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling uses to notify you when an instance is in the transition state for the lifecycle hook.	This target can be either an MNS queue or an MNS topic. The format of the parameter value is acs:ess:{region}:{account-id}:{resource-relative-id}. • `region`: the region where the scaling group resides. • `account-id`: the ID of the Apsara Stack tenant account. Examples: • MNS queue: acs:ess:{region}:{account-id}:queue/{queuename} • MNS topic: acs:ess:{region}:{account-id}:topic/{topicname}

Property	Type	Required	Editable	Description	Constraint
HeartbeatTimeout	Integer	No	Yes	The waiting period before the lifecycle hook times out. When the lifecycle hook times out, the scaling group performs the action specified by the DefaultResult parameter. Unit: seconds.	Valid values: 30 to 21600. Default value: 600.
NotificationMetadata	String	No	Yes	The fixed string to include when Auto Scaling sends a notification about the wait state of a scaling activity. Auto Scaling sends the specified `NotificationMetadata` parameter value along with the notification message so that you can easily categorize notifications. The `NotificationMetadata` parameter is valid only after you set the `NotificationArn` parameter.	The parameter value cannot exceed 128 characters in length.
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
DefaultResult	String	No	Yes	The action that the scaling group takes when the lifecycle hook times out. If the scaling group has multiple lifecycle hooks and one of them is terminated when the `DefaultResult` parameter is set to ABANDON during a `scale-in` event, the remaining lifecycle hooks in the same scaling group will also be terminated. Otherwise, the scaling activity will proceed normally after the waiting period expires and continue with the action specified by the DefaultResult parameter.	Valid values: • CONTINUE: The scaling group continues the scale-in or scale-out event. • ABANDON: The scaling group releases the created ECS instances if the scaling activity type is scale-out or removes the ECS instances to be scaled in if the scaling activity type is scale-in. Default value: CONTINUE.

Property	Type	Required	Editable	Description	Constraint
LifecycleTransition	String	Yes	Yes	The type of scaling activity to which the lifecycle hook applies.	Valid values: • SCALE_OUT: scale-out events of the scaling group. • SCALE_IN: scale-in events of the scaling group.

Response parameters

Fn::GetAtt

LifecycleHookId: the ID of the lifecycle hook.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "LifecycleHookName": {
      "Type": "String",
      "Description": "The name of the lifecycle hook. Each name must be unique within a scaling group. The name must be 2 to 40 characters in length and can contain letters, numbers, Chinese characters, and special characters including underscores (_), hyphens (-) and periods (.).\nDefault value: Lifecycle Hook ID",
      "AllowedPattern": "^[a-zA-Z0-9\\u4e00-\\u9fa5][-_.a-zA-Z0-9\\u4e00-\\u9fa5]{1,63}$"
    },
    "NotificationArn": {
      "Type": "String",
      "Description": "The Alibaba Cloud Resource Name (ARN) of the notification target that Auto Scaling will use to notify you when an instance is in the transition state for the lifecycle hook. This target can be either an MNS queue or an MNS topic. The format of the parameter value is acs:ess:{region}:{account-id}:{resource-relative-id}.\nregion: the region to which the scaling group locates\naccount-id: Alibaba Cloud ID\nFor example:\nMNS queue: acs:ess:{region}:{account-id}:queue/{queuename}\nMNS topic: acs:ess:{region}:{account-id}:topic/{topicname}",
      "AllowedPattern": "^acs:ess:([a-zA-Z0-9-]+):(\\d+):(queue|topic)/([a-zA-Z0-9][a-zA-Z0-9-]{0,255})$",
      "MaxLength": 300
    },
    "ScalingGroupId": {
      "Type": "String",
      "Description": "The ID of the scaling group."
    },
    "LifecycleTransition": {
      "Type": "String",
      "Description": "The scaling activities to which lifecycle hooks apply Value range:\n SCALE_OUT: scale-out event\n SCALE_IN: scale-in event",
      "AllowedValues": [
        "SCALE_OUT",
        "SCALE_IN"
      ]
    },
    "HeartbeatTimeout": {
      "Type": "Number",
      "Description": "The time, in seconds, that can elapse before the lifecycle hook times out. If the lifecycle hook times out, the scaling group performs the default action (DefaultResult). The range is from 30 to 21,600 seconds. The default value is 600 seconds.\nYou can prevent the lifecycle hook fro
```

```
m timing out by calling the RecordLifecycleActionHeartbeat operation. You can also terminate the lifec
ycle action by calling the CompleteLifecycleAction operation.",
      "MinValue": 30,
      "MaxValue": 21600
    },
    "NotificationMetadata": {
      "Type": "String",
      "Description": "The fixed string that you want to include when Auto Scaling sends a message abou
t the wait state of the scaling activity to the notification target. The length of the parameter can b
e up to 128 characters. Auto Scaling will send the specified NotificationMetadata parameter along with
the notification message so that you can easily categorize your notifications. The NotificationMetadat
a parameter will only take effect after you specify the NotificationArn parameter.",
      "MaxLength": 128
    },
    "DefaultResult": {
      "Type": "String",
      "Description": "The action that the scaling group takes when the lifecycle hook times out. Value
range:\n CONTINUE: the scaling group continues with the scale-in or scale-out process.\n ABANDON: the
scaling group stops any remaining action of the scale-in or scale-out event.\nDefault value: CONTINUE\
nIf the scaling group has multiple lifecycle hooks and one of them is terminated by the DefaultResult=
ABANDON parameter during a scale-in event (SCALE_IN), the remaining lifecycle hooks under the same sca
ling group will also be terminated. Otherwise, the action following the wait state is the next action,
as specified in the parameter DefaultResult, after the last lifecycle event under the same scaling gro
up.",
      "AllowedValues": [
        "CONTINUE",
        "ABANDON"
      ]
    }
  },

        ]
      }
    }
  }
}
```

5.1.6.2.4. ALIYUN::ESS::ScalingConfiguration

ALIYUN::ESS::ScalingConfiguration is used to create a scaling configuration for a scaling group.

Statement

```
{
  "Type": "ALIYUN::ESS::ScalingConfiguration",
  "Properties": {
    "PasswordInherit": Boolean,
    "DiskMappings": List,
    "RamRoleName": String,
    "IoOptimized": String,
    "InternetChargeType": String,
    "KeyPairName": String,
    "InstanceId": String,
    "InstanceTypes": List,
    "ImageId": String,
    "ResourceGroupId": String,
    "SpotStrategy": String,
    "InstanceType": String,
    "SystemDiskCategory": String,
    "SystemDiskSize": Integer,
    "SystemDiskAutoSnapshotPolicyId": String,
    "InternetMaxBandwidthOut": Integer,
    "InstanceName": String,
    "InternetMaxBandwidthIn": Integer,
    "ScalingConfigurationName": String,
    "UserData": String,
    "DeploymentSetId": String,
    "SecurityGroupId": String,
    "SpotPriceLimit": Number,
    "HpcClusterId": String,
    "ScalingGroupId": String,
    "SpotPriceLimitForInstanceType": Map,
    "TagList": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	True	The ID of the resource group to which the instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
DeploymentSetId	String	Yes	Released	The ID of the deployment set.	None
HpcClusterId	String	Yes	Released	The ID of the E-HPC cluster to which the instance belongs.	None
ScalingGroupId	String	No	No	The ID of the scaling group to which the scaling configuration belongs.	None
DiskMappings	List	No.	True	The disks to be attached to created instances.	A maximum of 16 disks can be attached to each instance.
InternetChargeType	String	Yes	True	The billing method for Internet usage.	Valid values: • PayByBandwidth • PayByTraffic: pay-by-traffic Default value: PayByTraffic
InternetMaxBandwidthIn	String	Optional	Released	The maximum inbound bandwidth from the Internet.	Unit: Mbit/s. Valid values: 1 to 100. Default value: 100
InternetMaxBandwidthOut	String	No.	True	The maximum outbound bandwidth to the Internet.	Valid values: • Pay-by-bandwidth: 0 to 100. Default value: 0. • Pay-by-data-transfer: 1 to 200. This parameter is required. Unit: Mbit/s.
InstanceId	String	Yes	Released	The instance ID of the scaling configuration.	None

Parameter	Type	Required	Editable	Description	Constraint
SystemDiskCategory	String	Yes	True	The category of the system disk.	Valid values: • cloud: indicates a basic disk. • cloud_efficiency: indicates an ultra disk. • cloud_ssd: indicates a standard SSD. • ephemeral_ssd: indicates a local SSD. • cloud_essd: enhanced SSD (ESSD) Default value: cloud for Generation I instance types that are not I/O optimized, default value: cloud_efficiency.
ImageId	String	Yes	True	The ID of the image used to start the instance. You can use a public image, a custom image, or an Alibaba Cloud Marketplace image.	None
InstanceType	String	Yes	True	The specification of the instance.	None
SecurityGroupId	String	Yes	True	The ID of the security group to which the instance belongs.	None
IoOptimized	String	Yes	True	Specifies whether the created instances are I/O optimized.	Valid values: • none (non-I/O optimized) • optimized Default value: none.

Parameter	Type	Required	Editable	Description	Constraint
ScalingConfigurationName	String	Yes	True	The name of the scaling configuration.	• The name must be 2 to 64 characters in length. It can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. • The name of the scaling configuration must be unique within a scaling group. • If this parameter is not specified, the value of scalingconfigurationid is used.
KeyPairName	String	Yes	True	The name of the key pair that is bound to the instance.	• This parameter is ignored if the instance type is Windows and the default value is null. • If the instance type is Linux, password logon is disabled by default.
RamRoleName	String	Yes	True	The RAM role name of the instance.	You can use RAM API ListRoles you can call this operation to query the RAM role name of an instance.
SystemDiskSize	String	No.	True	The size of the system disk. Unit: GB.	Valid values: 40 to 500. Unit: GB. If a custom image is used to create a system disk, the system disk size must be larger than the size of the custom image.
UserData	String	Yes	True	The user data that you pass when you create the instance.	The user can encode up to 16KB in size. You do not need to perform Base64 encoding. Special characters must be escaped with a backslash (\).

Parameter	Type	Required	Editable	Description	Constraint
InstanceTypes	List	No.	True	The instance types from which ECS instances can be created. If you specify InstanceTypes, InstanceType is invalid.	Up to 10 instance types can be configured in a scaling configuration. The priority of each instance type is decreased in the order of its list elements. Auto Scaling creates instances in order of priority. If an instance of the highest priority type cannot be created, Auto Scaling will create an instance of the next highest priority type.
PasswordInherit	Boolean	No.	True	Specifies whether to use the preconfigured password of the specified image.	To use this parameter, ensure that a password is configured for the specified image.
TagList	List	No.	True	The tags of the instance.	Tags must be specified as key-value pairs. You can specify a maximum of five Tag groups in the format of `{"key1": "value1", "key2": "value2", ... "key5": "value5"}`. The key can contain a maximum of 64 characters. `aliyun`, `http://` or `https://` the beginning. If you use tags, the key cannot be an empty string. The value must be 0 to 128 characters in length.
SpotStrategy	String	Yes	True	The preemption policy for pay-as-you-go instances.	Valid values: • NoSpot (pay-as-you-go instance) • SpotWithPriceLimit (a preemptible instance with a maximum price) • SpotAsPriceGo (the SpotAsPriceGo parameter that is set automatically based on the actual market price.) Default value: NoSpot.
InstanceName	String	Yes	True	The name of the instance created based on the current scaling configuration.	None

Parameter	Type	Required	Editable	Description	Constraint
SpotPriceLimit	Number	No.	True	The maximum hourly price of the instance.	A maximum of three decimal places can be specified. This parameter takes effect only when the SpotStrategy parameter is set to SpotWithPriceLimit. The value of this parameter can be overwritten by the value of the SpotPriceLimitForInstanceType parameter.
SpotPriceLimitForInstanceType	Map	No.	True	Preemptible instance type and bid of the instance.	The format is `{"<instance_type_1>": <price_limit_1>, ..., {"<instance_type_10>": <price_limit_10>}`. This parameter takes effect only when the SpotStrategy parameter is set to SpotWithPriceLimit. You can set up to 10 instance groups and prices.
SystemDiskAutoSnapshotPolicyId	String	Yes	True	The ID of the automatic snapshot policy applied to the data disk.	None

DiskMappings syntax

```
"DiskMappings": [
  {
    "Category": String,
    "Device": String,
    "SnapshotId": String,
    "Size": String,
    "Encrypted": String,
    "KMSKeyId": String,
    "Description": String,
    "DiskName": String
  }
]
```

DiskMappings properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Size	String	No	No	The size of the data disk.	Valid values: • cloud: 5 to 2000 • cloud_efficiency: 20 to 32768 • cloud_ssd: 20 to 32768 • cloud_essd: 20 to 32768. • ephemeral_ssd: 5 to 800 The value of this parameter must be greater than or equal to that of the snapshot specified by SnapshotId. Unit: GiB.
Category	String	Yes	Released	The type of the data disk.	Valid values: cloud, cloud_efficiency, cloud_ssd, ephemeral_ssd, and cloud_essd. For I/O optimized instances, the default value is cloud_efficiency. For non-I/O optimized instances, the default value is cloud.
DiskName	String	Yes	Released	The name of the data disk.	The name must be 2 to 128 characters in length It can contain letters, digits, colons (:), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://` the beginning.
Description	String	Yes	Released	The description of the data disk.	The description must be 2 to 256 characters in length. Cannot `http://` or `https://` the beginning.
Device	String	Yes	Released	The device name of the data disk.	By default, the system automatically assigns a value for this parameter when the ECS instance is created. The value starts from /dev/xvdb and ends at /dev/xvdz.

Parameter	Type	Required	Editable	Description	Constraint
SnapshotId	String	Yes	Released	The ID of the snapshot used to create the data disk.	If this parameter is specified, the Size parameter will be ignored, and the Size of the created disk will be the Size of the specified snapshot. If the snapshot was created on or before July 15, 2013, calling the snapshot is denied and InvalidSnapshot.TooOld is displayed in the response parameter.
Encrypted	String	Yes	Released	Specifies whether to encrypt the data disk.	Default value: false.
KMSKeyId	String	Yes	Released	The KMS key ID for data disk N.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

ScalingConfigurationId: the ID of the scaling configuration. This ID is a globally unique identifier (GUID) generated by the system.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingConfiguration": {
      "Type": "ALIYUN::ESS::ScalingConfiguration",
      "Properties": {
        "ImageId": "ubuntu1404_64_20G_aliaegis_2015****.vhd",
        "InstanceType": "ecs.t1.small",
        "InstanceId": "i-25xhh****",
        "InternetChargeType": "PayByTraffic",
        "InternetMaxBandwidthIn": 1,
        "InternetMaxBandwidthOut": 20,
        "SystemDisk_Category": "cloud",
        "ScalingGroupId": "bwhtvpcBcKYac9fe3vd0****",
        "SecurityGroupId": "sg-25zwc****",
        "DiskMappings": [
          {
            "Size": 10
          },
          {
            "Category": "cloud",
            "Size": 10
          }
        ]
      }
    }
  },
  "Outputs": {
    "ScalingConfiguration": {
      "Value": {"get_attr": ["ScalingConfigurationId"]}
    }
  }
}
```

5.1.6.2.5. ALIYUN::ESS::ScalingGroup

ALIYUN::ESS::ScalingGroup is used to create a scaling group. A scaling group is a group of ECS instances that are dynamically scaled based on the configured scenario. A scaling group does not take effect immediately after it is created. You must use ALIYUN::ESS::ScalingGroupEnable to enable the scaling group to trigger scaling rules and execute scaling activities.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingGroup",
  "Properties": {
    "MultiAZPolicy": String,
    "DesiredCapacity": Integer,
    "NotificationConfigurations": List,
    "ProtectedInstances": List,
    "LaunchTemplateId": String,
    "LaunchTemplateVersion": String,
    "ScalingGroupName": String,
    "VSwitchIds": List,
    "DefaultCooldown": Integer,
    "MinSize": Integer,
    "GroupDeletionProtection": Boolean,
    "MaxSize": Integer,
    "InstanceId": String,
    "VSwitchId": String,
    "LoadBalancerIds": List,
    "StandbyInstances": List,
    "RemovalPolicys": List,
    "HealthCheckType": String,
    "DBInstanceIds": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
MinSize	Integer	Yes	Yes	The minimum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is less than the MinSize value, Auto Scaling automatically creates ECS instances until the number of instances is equal to the MinSize value.

Property	Type	Required	Editable	Description	Constraint
MaxSize	Integer	Yes	Yes	The maximum number of ECS instances in the scaling group.	Valid values: 0 to 1000. When the number of ECS instances in the scaling group is greater than the MaxSize value, Auto Scaling removes ECS instances from the scaling group until the number of instances is equal to the MaxSize value.
ScalingGroupName	String	No	Yes	The display name of the scaling group.	• The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). • It must start with an uppercase letter, lowercase letter, or digit. • The name must be unique to an Alibaba Cloud account in a region. The default value is the ID of the scaling group.
LaunchTemplateId	String	No	Yes	The ID of the instance launch template from which the scaling group obtains launch configurations.	None

Property	Type	Required	Editable	Description	Constraint
LaunchTemplateVersion	String	No	Yes	The version of the instance launch template.	Valid values: • The fixed template version number. • Default: The default template version is always used. • Latest: The latest template version is always used.
RemovalPolicys	List	No	Yes	The list of one or more policies that are used to remove ECS instances from the scaling group.	Default value: OldestScalingConfiguration or OldestInstance. Valid values: • OldestInstance: removes the ECS instance that is added to the scaling group at the earliest point in time. • NewestInstance: removes the ECS instance that is added to the scaling group at the latest point in time. • OldestScalingConfiguration: removes the ECS instance that is created based on the earliest scaling configuration.
VSwitchId	String	No	No	The ID of the vSwitch.	None

Property	Type	Required	Editable	Description	Constraint
LoadBalancerIds	List	No	Yes	The ID of the Server Load Balancer (SLB) instance.	This value can be a JSON array that contains up to five SLB instance IDs. Separate multiple IDs with commas (,).
DefaultCooldown	Integer	No	Yes	The cooldown time after a scaling activity (adding or removing ECS instances) is executed.	• Valid values: 0 to 86400. • Unit: seconds. • Default value: 300. During the cooldown time, the scaling group executes only scaling activities that are triggered by Cloud Monitor event-triggered tasks.
DBInstanceIds	List	No	Yes	The list of one or more ApsaraDB RDS instance IDs.	This value can be a JSON array that contains up to eight ApsaraDB RDS instance IDs. Separate multiple IDs with commas (,).

Property	Type	Required	Editable	Description	Constraint
VSwitchIds	List	No	No	The list of one or more vSwitch IDs.	You can specify a maximum of five vSwitch IDs. If you specify this parameter, the VSwitchId parameter is ignored. vSwitches are sorted in descending order of priority. When an ECS instance cannot be created in the zone where the vSwitch with the highest priority resides, the system uses the vSwitch with the next highest priority to create the ECS instance.
MultiAZPolicy	String	No	No	The ECS instance scaling policy for the multi-zone scaling group.	Valid values: • PRIORITY: ECS instances are scaled based on the specified vSwitch. When an ECS instance cannot be created in the zone where the vSwitch with the highest priority resides, the system uses the vSwitch with the next highest priority to create the ECS instance. • BALANCE: ECS instances are distributed evenly in multiple zones specified in the scaling group. • COST_OPTIMIZ

Property	Type	Required	Editable	Description	Constraint
					ED: ECS instances are created based on the unit price of vCPUs, from low to high. Preemptible instances are created first when preemptible instance types are specified for the scaling configuration. Pay-as-you-go instances are automatically created when no preemptible instances are available due to issues such as insufficient ECS resources.
NotificationConfigurations	List	No	Yes	The notification configurations for event and resource changes.	None
ProtectedInstances	List	No	Yes	The number of protected ECS instances in the scaling group.	Maximum value: 1000.
StandbyInstances	List	No	Yes	The number of ECS instances that are in the standby state in the scaling group.	Maximum value: 1000.
HealthCheckType	String	No	Yes	The health check type.	Valid values: • ECS • NONE

Property	Type	Required	Editable	Description	Constraint
GroupDeletionProtection	Boolean	No	Yes	Specifies whether to enable deletion protection for the scaling group.	Default value: false. Valid values: • true: enables deletion protection for the scaling group. In this case, you cannot delete the scaling group. • false: disables deletion protection for the scaling group.
DesiredCapacity	Integer	No	Yes	The expected number of ECS instances in the scaling group. The scaling group automatically keeps the number of ECS instances at the expected value.	The number of ECS instances must be greater than the MinSize value and less than the MaxSize value.
InstanceId	String	No	No	The ID of the ECS instance from which the scaling group obtains configuration information to create scaling configurations.	None

Response parameters

Fn::GetAtt

ScalingGroupId: the ID of the scaling group. This ID is a globally unique identifier (GUID) that is generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingGroup": {
      "Type": "ALIYUN::ESS::ScalingGroup",
      "Properties": {
        "MaxSize": 1,
        "MinSize": 1,
        # "ScalingGroupName": "HeatCreatedR****",
        # "DefaultCooldown": 500,
        # "RemovalPolicy_1": "",
        # "RemovalPolicy_2": "",
      }
    }
  },
  "Outputs": {
    "ScalingGroup": {
         "Value": {"Fn::GetAtt": ["ScalingGroup", "ScalingGroupId"]}
    }
  }
}
```

5.1.6.2.6. ALIYUN::ESS::ScalingGroupEnable

ALIYUN::ESS::ScalingGroupEnable is used to enable a scaling group.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingGroupEnable",
  "Properties": {
    "ScalingConfigurationId": String,
    "ScalingRuleArisExecuteVersion": Integer,
    "ScalingRuleAris": List,
    "ScalingGroupId": String,
    "RemoveInstanceIds": List,
    "InstanceIds": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group.	None
ScalingConfigurationId	String	No	No	The ID of the scaling configuration to be activated in the scaling group.	None

Property	Type	Required	Editable	Description	Constraint
InstanceIds	List	No	Yes	The IDs of ECS instances to be added to the enabled scaling group.	A maximum of 20 instance IDs can be specified.
ScalingRuleArisExecuteVersion	Integer	No	Yes	The version of the identifier for the scaling rule to be executed. If you change this property, all scaling rules specified by ScalingRuleAris will be executed once.	Minimum value: 0.
ScalingRuleAris	List	No	Yes	The unique identifiers of scaling rules in the scaling group. Invalid unique identifiers are not displayed in the query results and no errors are reported.	A maximum of 10 scaling rule identifiers can be specified.
RemoveInstanceIds	List	No	Yes	The IDs of ECS instances to be deleted.	A maximum of 1,000 instance IDs can be specified.

Response parameters

Fn::GetAtt

- LifecycleState: the status of the scaling group.
- ScalingInstances: the instances that are automatically created in the scaling group.
- ScalingGroupId: the ID of the scaling group.
- ScalingRuleArisExecuteResultInstancesRemoved: the instances that are removed from the scaling group by executing the scaling rules specified by ScalingRuleAris.
- ScalingRuleArisExecuteResultNumberOfAddedInstances: the number of instances that are added to the scaling group by executing the scaling rules specified by ScalingRuleAris.
- ScalingInstanceDetails: the instance scaling details.
- ScalingRuleArisExecuteErrorInfo: the error information about the execution of the scaling rules specified by ScalingRuleAris.
- ScalingRuleArisExecuteResultInstancesAdded: the instances that are added to the scaling group by executing the scaling rules specified by ScalingRuleAris.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingGroupEnable": {
      "Type": "ALIYUN::ESS::ScalingGroupEnable",
      "Properties": {
        "ScalingGroupId": "r0HUqbJ411cc2eQw8bU****",
        "ScalingConfigurationId": "bJlLfdexm77Ldsyptmel****",
        "InstanceIds": "",
      }
    }
  },
  "Outputs": {
    "ScalingGroupEnable": {
      "Value": {"Fn::GetAtt": ["ScalingGroupEnable", "LifecycleState"]}
    }
  }
}
```

5.1.6.2.7. ALIYUN::ESS::ScalingRule

ALIYUN::ESS::ScalingRule is used to create a scaling rule.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScalingRule",
  "Properties": {
    "AdjustmentValue": Integer,
    "Cooldown": Integer,
    "ScalingGroupId": String,
    "AdjustmentType": String,
    "ScalingRuleName": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AdjustmentValue	Integer	No	Yes	The number of ECS instances to add or release when scaling occurs. The number of ECS instances to be adjusted in a single scaling activity cannot exceed 500.	Valid values in different adjustment modes: • QuantityChangeInCapacity: -500 to 500. • PercentChangeInCapacity: -100 to 10000. • TotalCapacity: 0 to 1000.
Cooldown	Integer	No	Yes	The cooldown period of the scaling rule. Unit: seconds.	Valid values: 0 to 86400. This parameter is empty by default.

Property	Type	Required	Editable	Description	Constraint
ScalingGroupId	String	Yes	No	The ID of the scaling group to which the scaling rule belongs.	None
AdjustmentType	String	Yes	Yes	The adjustment mode of the scaling rule.	Valid values: • QuantityChangeInCapacity: adds or removes a specified number of ECS instances. • PercentChangeInCapacity: adds or removes a specified proportion of ECS instances. • TotalCapacity: adds or removes ECS instances to ensure that the current scaling group has a specified number of ECS instances.
ScalingRuleName	String	No	Yes	The display name of the scaling rule.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. The name of a scaling rule must be unique within the scaling group that it belongs to. The default value is the ID of the scaling rule.

Response parameters

Fn::GetAtt

- ScalingRuleAri: the unique identifier of the scaling rule.
- ScalingRuleId: the ID of the scaling rule. It is a globally unique identifier (GUID) generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScalingRule": {

        ]
      }
    }
  }
}
```

5.1.6.2.8. ALIYUN::ESS::ScheduledTask

ALIYUN::ESS::ScheduledTask is used to create a scheduled task based on input parameters.

Syntax

```
{
  "Type": "ALIYUN::ESS::ScheduledTask",
  "Properties": {
    "TaskEnabled": Boolean,
    "Description": String,
    "ScheduledTaskName": String,
    "LaunchExpirationTime": Integer,
    "LaunchTime": String,
    "RecurrenceEndTime": String,
    "RecurrenceType": String,
    "RecurrenceValue": String,
    "ScheduledAction": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
TaskEnabled	Boolean	No	Yes	Specifies whether to start the scheduled task. • true: starts the scheduled task. • false: stops the scheduled task. Default value: true.	None
Description	String	No	Yes	The description of the scheduled task.	The description must be 2 to 200 characters in length.

Property	Type	Required	Editable	Description	Constraint
ScheduledTaskName	String	No	Yes	The display name of the scheduled task.	The name must be 2 to 40 characters in length and can contain letters, digits, underscores (_), hyphens (-), and periods (.). It must start with a letter or digit. This parameter must be unique in a region and under an Apsara Stack tenant account. The default value is the ID of the scheduled scaling task.
LaunchExpirationTime	Integer	No	Yes	The time period during which a failed scheduled task is retried. Unit: seconds. Default value: 600.	Valid values: 0 to 21600.
LaunchTime	String	Yes	Yes	The time at which the scheduled task is triggered. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC. If the RecurrenceType parameter is specified, the task is executed each day at the time specified by LaunchTime. If the RecurrenceType parameter is not specified, the task is only executed once at the date and time specified by LaunchTime. You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification.	None

Property	Type	Required	Editable	Description	Constraint
RecurrenceEndTime	String	No	Yes	The end time after which the scheduled task will not be repeated. Specify the time in the ISO 8601 standard in the YYYY-MM-DDThh:mmZ format. The time must be in UTC. You cannot enter a point in time later than 90 days from the date of scheduled task creation or modification. If you set RecurrenceEndTime, you must also set both RecurrenceType and RecurrenceValue.	None
RecurrenceType	String	No	Yes	The interval that the scheduled task is repeated at.	Valid values: • Daily: The scheduled task is executed once every specified number of days. • Weekly: The scheduled task is executed on each specified day of a week. • Monthly: The scheduled task is executed on each specified day of a month. • Cron: The scheduled task is executed based on the specified Cron expression. If you set RecurrenceType, you must also set both RecurrenceEndTime and RecurrenceValue.

Property	Type	Required	Editable	Description	Constraint
RecurrenceValue	String	No	Yes	Specifies how often the scheduled task recurs.	• Daily: indicates the interval of days that the scheduled task is repeated on. You can enter a single value ranging from 1 to 31. • Weekly: indicates which days of the week that the scheduled task is repeated on. You can enter multiple values separated by commas (,). The values 0 to 6 correspond to the days of the week in sequence from Sunday to Saturday. • Monthly: indicates which days of the month that the scheduled task is repeated on. You can enter two values ranging from 1 to 31. The format is A-B. B must be greater than or equal to A. • Cron: indicates a user-defined Cron expression that the scheduled task is repeated on. A Cron expression is written in UTC time and consists of five fields: minute, hour, day of month (date), month, and day of week. The expression can contain wildcard characters including commas (,), question marks (?), hyphens (-), asterisks (*), number signs (#), forward slashes (/), and the L and W characters. If you set RecurrenceValue, you must also set both RecurrenceEndTime and RecurrenceType.
ScheduledAction	String	Yes	Yes	The operations to be performed when the scheduled task is triggered. When you set this parameter, you must also enter the unique identifier of the scaling rule.	The parameter value can be up to 200 characters in length.

Response parameters

Fn::GetAtt

ScheduledTaskId: the ID of the scheduled task. This ID is a globally unique identifier (GUID) generated by the system.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "ScheduledTask": {
      "Type": "ALIYUN::ESS::ScheduledTask",
      "Properties": {
        "TaskEnabled": "true",
        "Description": "scheduledtask",
        "ScheduledTaskName": "task1",
        "LaunchTime": "2014-08-17T16:52Z",
        "RecurrenceEndTime": "2014-08-17T16:55Z",
        "RecurrenceType": "Daily",
        "RecurrenceValue": "1",
        "ScheduledAction": "ari:acs:ess:cn-qingdao:1344371:scalingRule/cCBpdYdQuBe2cUxOdu6piOk"
      }
    }
  },
  "Outputs": {
    "ScheduledTaskId": {
      "Value": {
        "FN::GetAtt": [
          "ScheduledTask",
          "ScheduledTaskId"
        ]
      }
    }
  }
}
```

5.1.6.3. NAS

5.1.6.3.1. ALIYUN::NAS::AccessGroup

ALIYUN::NAS::AccessGroup is used to create a permission group.

Syntax

```
{
  "Type": "ALIYUN::NAS::AccessGroup",
  "Properties": {
    "AccessGroupType": String,
    "AccessGroupName": String,
    "Description": String
  }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
AccessGroupType	String	Yes	No	The type of the permission group.	Valid values: VPC and Classic.
AccessGroupName	String	Yes	No	The name of the permission group.	The name must be 3 to 64 characters in length. It must start with a letter, digit, or hyphen (-).
Description	String	No	Yes	The description of the permission group. The description is the same as the permission group name by default.	None

Response parameters

FN::GetAtt

AccessGroupName: the name of the permission group.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AccessGroup": {
      "Type": "ALIYUN::NAS::AccessGroup",
      "Properties": {
        "AccessGroupType": {
          "Ref": "AccessGroupType"
        },
        "AccessGroupName": {
          "Ref": "AccessGroupName"
        },
        "Description": {
          "Ref": "Description"
        }
      }
    }
  },
  "Parameters": {
    "AccessGroupType": {
      "Type": "String",
      "Description": "Permission group type, including the Vpc and Classic types",
      "AllowedValues": ["Vpc", "Classic"]
    },
    "AccessGroupName": {
      "AllowedPattern": "^[a-zA-Z0-9-]{3,64}$",
      "Type": "String",
      "Description": "Permission group name"
    },
    "Description": {
      "Type": "String",
      "Description": "Permission group description. It is the same as the permission group name by default."
    }
  },
  "Outputs": {
    "AccessGroupName": {
      "Description": "Permission group name",
      "Value": {
        "Fn::GetAtt": ["AccessGroup", "AccessGroupName"]
      }
    }
  }
}
```

5.1.6.3.2. ALIYUN::NAS::AccessRule

ALIYUN::NAS::AccessRule is used to create a permission rule.

Syntax

```
{
  "Type": "ALIYUN::NAS::AccessRule",
  "Properties": {
    "Priority": Integer,
    "UserAccessType": String,
    "AccessGroupName": String,
    "SourceCidrIp": String,
    "RWAccessType": String
  }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
Priority	Integer	No	Yes	The user access priority.	Valid values: 1 to 100. Default value: 1.
UserAccessType	String	No	Yes	The user access type.	Valid values: no_squash, root_squash, and all_squash. Default value: no_squash.
AccessGroupName	String	Yes	No	The name of the permission group.	None
SourceCidrIp	String	Yes	Yes	The authorized IP address or CIDR block.	None
RWAccessType	String	No	Yes	The read/write permission type.	Valid values: RDWR and RDONLY. Default value: RDWR.

Response parameters

FN::GetAtt

AccessRuleId: the ID of the permission rule.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AccessRule": {
      "Type": "ALIYUN::NAS::AccessRule",
      "Properties": {
        "Priority": {
          "Ref": "Priority"
        },
        "RWAccessType ":{
          "Ref": "RWAccessType"
        },
        "UserAccessType": {
```

```
          "Ref": "UserAccessType"
        },
        "SourceCidrIp": {
          "Ref": "SourceCidrIp"
        },
        "AccessGroupName": {
          "Ref": "AccessGroupName"
        }
      }
    }
  },
  "Parameters": {
    "Priority": {
      "Default": 1,
      "Type": "Number",
      "Description": "Priority level. Range: 1-100. Default value: 1",
      "MaxValue": 100,
      "MinValue": 1
    },
    "RWAccessType": {
      "Default": "RDWR",
      "Type": "String",
      "Description": "Read-write permission type: RDWR (default), RDONLY",
      "AllowedValues": ["RDWR", "RDONLY"]
    },
    "UserAccessType": {
      "Default": "no_squash",
      "Type": "String",
      "Description": "User permission type: no_squash (default), root_squash, all_squash",
      "AllowedValues": ["no_squash", "root_squash", "all_squash"]
    },
    "SourceCidrIp": {
      "Type": "String",
      "Description": "Address or address segment"
    },
    "AccessGroupName": {
      "Type": "String",
      "Description": "Permission group name"
    }
  },
  "Outputs": {
    "AccessRuleId": {
      "Description": "Rule serial number",
      "Value": {
        "Fn::GetAtt": ["AccessRule", "AccessRuleId"]
      }
    }
  }
}
```

5.1.6.3.3. ALIYUN::NAS::FileSystem

ALIYUN::NAS::FileSystem is used to create a file system.

Syntax

```
{
  "Type": "ALIYUN::NAS::FileSystem",
  "Properties": {
    "SnapshotId": String,
    "Description": String,
    "StorageType": String,
    "DeletionForce": Boolean,
    "EncryptType": Integer,
    "VpcId": String,
    "ZoneId": String,
    "Capacity": Integer,
    "Tags": List,
    "ProtocolType": String,
    "FileSystemType": String,
    "Bandwidth": Integer,
    "VSwitchId": String,
    "Duration": Integer,
    "ChargeType": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ProtocolType	String	Yes	No	The protocol type.	Valid values: • NFS • SMB

StorageType	String	Yes	No	The storage type.	• Valid values when FileSystemType is set to standard:
					  ◦ Performance
					  ◦ Capacity
					• Valid values when FileSystemType is set to extreme or cpfs:
					  ◦ standard
					  ◦ advance

DeletionForce	Boolean	No	Yes	Specifies whether to forcibly delete all mount targets on the file system and then delete the file system.	Default value: false. Valid values: • true • false
Description	String	No	Yes	The description of the file system.	The description must be 2 to 128 characters in length and can contain letters, digits, colons(:), underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.

Property	Type	Required	Editable	Description	Constraint
ZoneId	String	No	No	The ID of the zone.	None
Tags	List	No	No	The list of one or more tags of the file system.	You can bind up to 20 tags to each file system. For more information, see Tags properties.
SnapshotId	String	No	No	The ID of the snapshot.	You can specify this parameter to create the NAS file system from the specified snapshot. This parameter takes effect only for Extreme NAS. **Note** If you create a file system from a snapshot, the version of the file system is the same as the version of the source file system of the snapshot. If the version of the source file system of a snapshot is 1 and you want to create a file system of version 2, perform the following operations: Create a file system (File System 1) from the snapshot. Create another file system (File System 2) whose version is 2. Migrate data from File System 1 to File System 2. Switch your business from File System 1 to File System 2.

Property	Type	Required	Editable	Description	Constraint
EncryptType	Integer	No	No	Specifies whether to encrypt the file system. You can use keys that are hosted by Key Management Service (KMS) to encrypt data that is stored in a file system. Data is automatically decrypted when you access encrypted data.	This parameter takes effect only when the FileSystemType parameter is set to standard or extreme. Valid values: • 0: The file system is not encrypted. • 1: The file system is encrypted.
Capacity	Integer	No	No	The capacity of the file system.	This parameter takes effect only when the FileSystemType parameter is set to standard or extreme. • Valid values when FileSystemType is set to extreme: 100 to 262144. • Valid values when FileSystemType is set to cpfs: 2048 to 512000. Unit: GB.
FileSystemType	String	No	No	The type of the file system.	Default value: standard. Valid values: • standard • extreme • cpfs
VpcId	String	No	No	The ID of the VPC. If you specify the VpcId and VSwitchId parameters, a default mount target is pre-configured when the file system is created.	This parameter is required when the FileSystemType parameter is set to cpfs.
Bandwidth	Integer	No	No	The maximum throughput of the file system.	This parameter is required when the FileSystemType parameter is set to cpfs. The value of this parameter is determined by the Capacity parameter. For more information, see the CPFS buy page. Unit: Mbit/s.

Property	Type	Required	Editable	Description	Constraint
VSwitchId	String	No	No	The ID of the vSwitch. If you specify the VpcId and VSwitchId parameters, a default mount target is pre-configured when the file system is created.	This parameter is required when the FileSystemType parameter is set to cpfs.
Duration	Integer	No	No	The subscription period of the file system.	This parameter is valid and required only when the ChargeType parameter is set to Subscription. If you do not renew a subscription file system before it expires, the file system is released. Valid values: • 1 • 2 • 3 • 6 • 12 • 36 Unit: months.
ChargeType	String	No	Yes	The billing method of the file system.	Valid values: • PayAsYouGo • Subscription

Tags syntax

```
"Tags": [
  {
    "Key": String,
    "Value": String
  }
]
```

Tags properties

Property	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	The key of the tag.	The tag key must be 1 to 128 characters in length and cannot contain `http://` or `https://`. It cannot start with `acs:` or `aliyun`.

Property	Type	Required	Editable	Description	Constraint
Value	String	No	No	The value of the tag.	The tag value must be 0 to 128 characters in length and cannot contain `http://` or `https://`. It cannot start with `acs:` or `aliyun`.

Response parameters

Fn::GetAtt

FileSystemId: the ID of the file system.

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Description": {
      "Type": "String",
      "Description": "File system description (space characters are not allowed)"
    },
    "StorageType": {
      "Type": "String",
      "Description": "The file system type. Currently includes the Performance type and the Capacity type"
    },
    "ZoneId": {
      "Type": "String",
      "Description": "Zone ID."
    },
    "VSwitchId": {
      "Type": "String",
      "Description": "VSwitch ID."
    },
    "Duration": {
      "Type": "Number",
      "Description": "The period of subscription in months. Required and valid when ChargeType is Subscription.\nWhen the annual and monthly subscription instance expires without renewal, the instance will automatically expire and be released."
    },
    "SnapshotId": {
      "Type": "String",
      "Description": "Snapshot ID."
    },
    "DeletionForce": {
      "Type": "Boolean",
      "Description": "Whether delete all mount targets on the file system and then delete file system. Default is false",
      "AllowedValues": [
        "True",
        "true",
        "False",
        "false"
      ],
      "Default": false
```

```
    },
    "EncryptType": {
      "Type": "Number",
      "Description": "Specifies whether to encrypt data. You can use keys that are hosted by Key Management Service (KMS) to encrypt data stored on a file system. Data is automatically decrypted when you access encrypted data. Valid values:\n0: specifies that no encryption is applied to data on the file system.\n1: specifies that encryption is applied to data on the file system."
    },
    "VpcId": {
      "Type": "String",

`YAML` format

```
ROSTemplateFormatVersion: '2015-09-01'
Parameters:
  Description:
    Type: String
```

```
    Type: String
    Description: File system description (space characters are not allowed)
  StorageType:
    Type: String
    Description: >-
      The file system type. Currently includes the Performance type and the
      Capacity type
  ZoneId:
    Type: String
    Description: Zone ID.
  VSwitchId:
    Type: String
    Description: VSwitch ID.
  Duration:
    Type: Number
    Description: >-
      The period of subscription in months. Required and valid when ChargeType
      is Subscription.
      When the annual and monthly subscription instance expires without renewal,
      the instance will automatically expire and be released.
  SnapshotId:
    Type: String
    Description: Snapshot ID.
  DeletionForce:
    Type: Boolean
    Description: >-
      Whether delete all mount targets on the file system and then delete file
      system. Default is false
    AllowedValues:
      - 'True'
      - 'true'
      - 'False'
      - 'false'
    Default: false
  EncryptType:
    Type: Number
    Description: >-
      Specifies whether to encrypt data. You can use keys that are hosted by Key
      Management Service (KMS) to encrypt data stored on a file system. Data is
      automatically decrypted when you access encrypted data. Valid values:
      0: specifies that no encryption is applied to data on the file system.
      1: specifies that encryption is applied to data on the file system.
  VpcId:
    Type: String
    Description: Vpc ID.
  Capacity:
    Type: Number
    Description: >-
      File system capacity, the unit is GB. Required and valid when
      FileSystemType=extreme or cpfs.
  ProtocolType:
    Type: String
    Description: Type of protocol used. Currently includes the NFS type and the SMB type
    AllowedValues:
      - NFS
      - SMB
  ChargeType:
    Type: String
    Description: |-
      Type of payment:
```

```
      PayAsYouGo (pay as you go)
      Subscription
    AllowedValues:
      - PayAsYouGo
      - Subscription
  FileSystemType:
    Type: String
    Description: 'File system type. Allowed values: standard, extreme, cpfs'
  Bandwidth:
    Type: Number
    Description: >-
      Maximum file system throughput, unit is MB/s. Required and valid only when
      FileSystemType=cpfs.
  Tags:
    Type: Json
    Description: >-
      Tags to attach to filesystem. Max support 20 tags to add during create
      filesystem. Each tag with two properties Key and Value, and Key is
      required.
    MaxLength: 20
Resources:
  FileSystem:

      'Fn::GetAtt':
        - FileSystem
```

```
      - FileSystemId
```

5.1.6.3.4. ALIYUN::NAS::MountTarget

ALIYUN::NAS::MountTarget is used to create a mount point.

Syntax

```
{
  "Type": "ALIYUN::NAS::MountTarget",
  "Properties": {
    "Status": String,
    "VpcId": String,
    "FileSystemId": String,
    "VSwitchId": String,
    "NetworkType": String,
    "AccessGroupName": String
  }
}
```

Properties

Name	Type	Required	Editable	Description	Validity
Status	String	No	Yes	The status of a file system.	Valid values: Active and Inactive.
VpcId	String	No	No	The ID of the VPC to which the file system belongs.	None
FileSystemId	String	Yes	No	The ID of the file system.	None
VSwitchId	String	No	No	The ID of the vSwitch in the VPC.	None
NetworkType	String	Yes	No	The network type.	Valid values: VPC and Classic.
AccessGroupName	String	Yes	Yes	The permission group name.	None

Response parameters

FN::GetAtt

MountTargetDomain: the domain name of the mount point.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "MountTarget": {
      "Type": "ALIYUN::NAS::MountTarget",
```

```
      "Properties": {
        "Status": {
          "Ref": "Status"
        },
        "VpcId": {
          "Ref": "VpcId"
        },
        "FileSystemId": {
          "Ref": "FileSystemId"
        },
        "VSwitchId": {
          "Ref": "VSwitchId"
        },
        "NetworkType": {
          "Ref": "NetworkType"
        },
        "AccessGroupName": {
          "Ref": "AccessGroupName"
        }
      }
    }
  },
  "Parameters": {
    "Status": {
      "Type": "String",
      "Description": "Status, including Active and Inactive",
      "AllowedValues": ["Active", "Inactive"]
    },
    "VpcId": {
      "Type": "String",
      "Description": "VPC network ID"
    },
    "FileSystemId": {
      "Type": "String",
      "Description": "File system ID"
    },
    "VSwitchId": {
      "Type": "String",
      "Description": "vSwitch ID."
    },
    "NetworkType": {
      "Type": "String",
      "Description": "Network type, including Vpc and Classic networks.",
      "AllowedValues": ["Vpc", "Classic"]
    },
    "AccessGroupName": {
      "Type": "String",
      "Description": "Permission group name"
    }
  },
  "Outputs": {
    "MountTargetDomain": {
      "Description": "Mount point domain name",
      "Value": {
        "Fn::GetAtt": ["MountTarget", "MountTargetDomain"]
      }
    }
  }
}
```

5.1.6.4. OSS

5.1.6.4.1. ALIYUN::OSS::Bucket

ALIYUN::OSS::Bucket is used to create an OSS bucket.

Syntax

```
{
  "Type": "ALIYUN::OSS::Bucket",
  "Properties": {
    "AccessControl": String,
    "RefererConfiguration": Map,
    "ServerSideEncryptionConfiguration": Map,
    "CORSConfiguration": Map,
    "Tags": Map,
    "LoggingConfiguration": Map,
    "LifecycleConfiguration": Map,
    "StorageClass": String,
    "DeletionForce": Boolean,
    "WebsiteConfiguration": Map,
    "Policy": Map,
    "BucketName": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
BucketName	String	Yes	No	The name of the bucket.	• The name must be 3 to 63 characters in length and can contain lowercase letters, digits, and hyphens (-). • It must start and end with a lowercase letter or digit.
AccessControl	String	No	No	The access control policy.	Valid values: private, public-read, and public-read-write.
CORSConfiguration	Map	No	No	The configuration of cross-origin resource sharing for objects in the bucket.	None
LifecycleConfiguration	Map	No	No	The lifecycle configuration for objects in the bucket.	None
LoggingConfiguration	Map	No	No	The logging configuration.	None

Property	Type	Required	Editable	Description	Constraint
RefererConfiguration	Map	No	No	The hotlinking protection configuration.	None
DeletionForce	Boolean	No	No	Specifies whether to forcibly delete objects from an OSS bucket	Valid values: • true • false Default value: false.
WebsiteConfiguration	Map	No	No	The information used to configure the bucket as a static website.	None
ServerSideEncryptionConfiguration	Map	No	No	The server-side encryption rules.	None
Tags	Map	No	No	The tags of the bucket. Tags exist as key-value pairs.	• A maximum of 20 tags can be specified. • A tag key must be 1 to 64 bytes in length and cannot start with `http://`, `https://`, or `Aliyun`. • A tag value can be up to 128 bytes in length and must be encoded in UTF-8.
StorageClass	String	No	No	The type of the bucket.	Valid values: Standard, IA, and Archive.
Policy	Map	No	No	The bucket policy configuration.	None

CORSConfiguration syntax

```
"CORSConfiguration": {
  "CORSRule": [
    {
      "AllowedHeader": String,
      "AllowedMethod": List,
      "AllowedOrigin": List,
      "ExposeHeader": List,
      "MaxAgeSeconds": Integer
    }
  ]
}
```

CORSConfiguration properties

Property	Type	Required	Editable	Description	Constraint
CORSRule	List	No	No	The rules that define cross-origin resource sharing of objects in the bucket.	None
AllowedHeader	String	No	No	The allowed cross-origin request headers.	Valid values: *, Cache-Control, Content-Language, Content-Type, Expires, Last-Modified, and Pragma.
AllowedMethod	List	No	No	The allowed cross-origin request methods.	Valid values: *, GET, PUT, POST, DELETE, and HEAD.
AllowedOrigin	List	No	No	The origins from which cross-origin requests are allowed.	None
ExposeHeader	List	No	No	The response headers for allowed access requests from applications.	Asterisks (*) cannot be used as wildcard characters.
MaxAgeSeconds	Integer	No	No	The period of time that the browser can cache the response of a preflight (OPTIONS) request to a specific resource.	None

LifecycleConfiguration syntax

```
"LifecycleConfiguration": {
  "Rule": [
    {
      "ID": String,
      "Prefix": String,
      "Status": String,
      "Expiration": Map,
      "AbortMultipartUpload": Map
    }
  ]
}
```

LifecycleConfiguration properties

Property	Type	Required	Editable	Description	Constraint
Rule	List	No	No	The lifecycle rule.	None
ID	String	No	No	The unique ID of the rule.	The ID can be up to 255 characters in length. When this parameter is empty or not specified, OSS generates a unique rule ID.
Prefix	String	No	No	The prefix to which the rule applies.	The rule takes effect only on objects that have a matching prefix.
Status	String	No	No	Specifies whether to enable or disable the rule.	Valid values: Enable and Disable.
Expiration	Map	No	No	The expiration attributes of the rule for the specified object.	None
AbortMultipartUpload	Map	No	No	The expiration attributes of the multipart upload tasks that are not complete.	None

Expiration syntax

```
"Expiration":{
  "Days": Number,
  "CreatedBeforeDate": String
}
```

Expiration properties

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

AbortMultipartUpload syntax

```
"AbortMultipartUpload": {
  "CreatedBeforeDate": String,
  "Days": Number
}
```

AbortMultipartUpload properties

Property	Type	Required	Editable	Description	Constraint
Days	Number	No	No	The number of days since the object was last modified after which the rule will take effect.	When the number of days since the object was last modified exceeds the specified number of days, the object is deleted. If you set the Days parameter to 30, objects that were last modified on January 1, 2016 are deleted by the backend application on January 31, 2016.
CreatedBeforeDate	String	No	No	The date before which the rule takes effect.	Specify the time in the ISO 8601 standard. The time must be UTC 00:00. Example: 2002-10-11T00:00:00.000Z.

LoggingConfiguration syntax

```
"LoggingConfiguration": {
  "TargetBucket": String,
  "TargetPrefix": String
}
```

LoggingConfiguration properties

Property	Type	Required	Editable	Description	Constraint
TargetBucket	String	No	No	The storage space for storing access logs.	None
TargetPrefix	String	No	No	The prefix of the names of saved access log files.	None

WebsiteConfiguration syntax

```
"WebsiteConfiguration":{
  "IndexDocument": String,
  "ErrorDocument": String
}
```

WebsiteConfiguration properties

Property	Type	Required	Editable	Description	Constraint
IndexDocument	String	No	No	The default homepage for a static website.	None
ErrorDocument	String	No	No	The default error page for a static website.	None

RefererConfiguration syntax

```
"RefererConfiguration":{
  "AllowEmptyReferer": String,
  "RefererList": List
}
```

RefererConfiguration properties

Property	Type	Required	Editable	Description	Constraint
AllowEmptyReferer	String	No	No	Specifies whether the Referer field can be left empty in an access request.	None

Property	Type	Required	Editable	Description	Constraint
RefererList	List	No	No	The referer whitelist. OSS allows requests whose Referer field values are in the referer whitelist.	None

ServerSideEncryptionConfiguration syntax

```
"ServerSideEncryptionConfiguration":{
  "KMSMasterKeyID": String,
  "SSEAlgorithm": String
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
KMSMasterKeyID	String	No	No	The ID of the customer master key.	The key ID is required only when the SSEAlgorithm value is KMS and the specified key is used for encryption.
SSEAlgorithm	String	Yes	No	The default server-side encryption method.	Valid values: KMS and AES256.

Response parameters

Fn::GetAtt

- Name: the bucket name, which must be globally unique.
- DomainName: the public domain name of the specified bucket.
- InternalDomainName: the internal domain name of the specified bucket.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Bucket": {
      "Type": "ALIYUN::OSS::Bucket",
      "Properties": {
        "AccessControl": "private",
        "BucketName": "rostest",
        "WebsiteConfiguration":{
            "IndexDocument": "index1.html",
            "ErrorDocument": "error404.html"
        },
        "LoggingConfiguration": {
            "TargetBucket": "cos-mirror",
            "TargetPrefix": "test404"
        },
        "CORSConfiguration": {
            "CORSRule": [{
                "AllowedHeader": ["*"],
                "AllowedMethod": ["GET", "PUT"],
                "AllowedOrigin": ["*"],
                "ExposeHeader": ["Date"],
                "MaxAgeSeconds": 3600
            }]
        },
        "LifecycleConfiguration": {
            "Rule": [{
                "ID": "deleteRule",
                "Prefix": "test/",
                "Status": "Enabled",
                "Expiration":{
                    "Days": 2
                },
                "AbortMultipartUpload":{
                    "CreatedBeforeDate": "2014-10-11T00:00:00.000Z"
                }
            }]
        },
        "RefererConfiguration": {
            "AllowEmptyReferer": true,
            "RefererList": ["http://www.aliyun.com", "https://www.?.aliyuncs.com"]
        }
      }
    }
  },
  "Outputs": {
    "Name": {
         "Value": {"Fn::GetAtt": ["Bucket","Name"]}
    },
    "DomainName": {
         "Value": {"Fn::GetAtt": ["Bucket","DomainName"]}
    }
  }
}
```

5.1.6.5. RDS

5.1.6.5.1. ALIYUN::RDS::Account

ALIYUN::RDS::Account is used to create a database management Account.

Statement

```
{
  "Type": "ALIYUN::RDS::Account",
  "Properties": {
    "AccountDescription": String,
    "DBInstanceId": String,
    "AccountPassword": String,
    "AccountType": String,
    "AccountName": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AccountDescription	String	Yes	True	The description of the account.	The name must be 2 to 256 characters in length. It can contain digits, letters, underscores (_), and hyphens (-); but must start with a letter.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
AccountPassword	String	No	No	The password of the database account.	The password must be 8 to 32 characters in length.
AccountType	String	Yes	Released	The type of the database account.	Valid values: • Normal: indicates a standard account. • Super: indicates a privileged account. Default value: Normal.

Parameter	Type	Required	Editable	Description	Constraint
AccountName	String	No	No	The name of the database account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

AccountName: the name of the database account.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Account": {
      "Type": "ALIYUN::RDS::Account",
      "Properties": {
        "AccountDescription": {
          "Ref": "AccountDescription"
        },
        "DBInstanceId": [
          "Ref": "DBInstanceId"
        },

      "Description": "Account remarks.\nIt cannot begin with http:// or https://.\nIt must start with a Chinese character or English letter.\nIt can include Chinese and English characters/letters, underscores (_), hyphens (-), and digits.\nThe length may be 2-256 characters."
    },
    "DBInstanceId": [
      "Type": "String",
      "Description": "RDS instance ID."
    },
    "AccountPassword": {
      "MinLength": 8,
      "Type": "String",
      "Description": "The account password for the database instance. It may consist of letters, digit
```

```
s, or underlines, with a length of 8 to 32 characters.",
      "MaxLength": 32
    },
    "AccountType": {
      "Default": "Normal",
      "Type": "String",
      "Description": "Privilege type of account.\nNormal: Common privilege.\nSuper: High privilege. And the default value is Normal.\nThis parameter is valid for MySQL 5.5/5.6 only.\nMySQL 5.7, SQL Server 2012/2016, PostgreSQL, and PPAS each can have only one initial account. Other accounts are created by the initial account that has logged on to the database.",
      "AllowedValues": ["Normal", "Super"]
    },
    "AccountName": {
      "Type": "String",
      "Description": "Account name, which must be unique and meet the following requirements:\nStart with a letter;\nConsist of lower-case letters, digits, and underscores (_);\nContain no more than 16 characters.\nFor other invalid characters, see Forbidden keywords table."
    }
  },
  "Outputs": {
    "AccountName": {
      "Description": "Account name",
      "Value": {
        "Fn::GetAtt": ["Account", "AccountName"]
      }
    }
  }
}
```

5.1.6.5.2. ALIYUN::RDS::AccountPrivilege

ALIYUN::RDS::AccountPrivilege is used to grant database access permissions to accounts.

Statement

```
{
  "Type": "ALIYUN::RDS::AccountPrivilege",
  "Properties": {
    "AccountPrivilege": String,
    "DBInstanceId": String,
    "DBName": String,
    "AccountName": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
AccountPrivilege	String	No	Yes	The permissions of the database account.	Valid values: • ReadWrite: has read and write permissions on the database. • ReadOnly: The account has read-only permission on the database. • DDLOnly: The account can run only data definition language (DDL) commands in the database. This is applicable to MySQL and MariaDB. • DMLOnly: The account can run only data manipulation language (DML) commands in the database. This is applicable to MySQL and MariaDB. • DBOwner: The account has full permissions on the database. This is applicable to SQL Server.
DBInstanceId	String	No	No	The ID of the RDS instance.	None
DBName	String	No	No	The name of the database.	None

Parameter	Type	Required	Editable	Description	Constraint
AccountName	String	No	No	The name of the account.	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

None

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",

}
```

5.1.6.5.3. ALIYUN::RDS::DBInstance

ALIYUN::RDS::DBInstance is used to create an ApsaraDB RDS instance.

Syntax

```
{
  "Type": "ALIYUN::RDS::DBInstance",
  "Properties": {
    "Engine": String,
    "MultiAZ": Boolean,
    "VpcId": String,
    "DBMappings": List,
    "DBInstanceDescription": String,
    "ConnectionMode": String,
    "MasterUsername": String,
    "MasterUserPassword": String,
    "ZoneId": String,
    "DBInstanceNetType": String,
    "DBInstanceStorage": Integer,
    "VSwitchId": String,
    "AllocatePublicConnection": Boolean,
    "EngineVersion": String,
    "PreferredBackupTime": String,
    "DBInstanceClass": String,
    "SecurityIPList": String,
    "BackupRetentionPeriod": Integer,
    "PrivateIpAddress": String,
    "PreferredBackupPeriod": List,
    "PeriodType": String,
    "PayType": String,
    "Period": Integer,
    "ResourceGroupId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
Engine	String	Yes	No	The database engine that the instance runs.	Valid values: • MySQL • SQLServer • PostgreSQL • PPAS

Property	Type	Required	Editable	Description	Constraint
DBInstanceStorage	Integer	Yes	Yes	The storage capacity of the instance.	• Valid values when Engine is set to MySQL: 5 to 1000. • Valid values when Engine is set to SQLServer: 10 to 1000. • Valid values when Engine is set to PostgreSQL: 5 to 2000. • Valid values when Engine is set to PPAS: 5 to 2000. Unit: GB. **Note** This value must be in 5 GB increments.
EngineVersion	String	Yes	No	The version of the database engine.	• Valid values when Engine is set to MySQL: 5.5, 5.6, 5.7, and 8.0. • Set the value to 2008r2 when Engine is set to SQLServer. • Set the value to 9.4 when Engine is set to PostgreSQL. • Set the value to 9.3 when Engine is set to PPAS.
DBInstanceClass	String	Yes	Yes	The instance type.	Valid values: • rds.mys2.large • rds.mss1.large • rds.pg.s1.small
SecurityIPList	String	Yes	Yes	The whitelist of IP addresses that are allowed to access all databases in the instance.	• Separate multiple IP addresses with commas (,). Each IP address in the whitelist must be unique. A maximum of 1,000 IP addresses can be specified. • The 0.0.0.0/0 format is supported. You can specify IP addresses in the 10.23.XX.XX format and CIDR blocks in the 10.23.XX.XX/24 format. In 10.23.XX.XX/24, /24 indicates the length of the prefix in the CIDR block, and the prefix length can range from 1 to 32. 0.0.0.0/0 indicates that no access restriction is applied.
MultiAZ	Boolean	No	No	Specifies whether the instance can be deployed across multiple zones.	None
VpcId	String	No	No	The ID of the VPC.	None

Property	Type	Required	Editable	Description	Constraint
DBMappings	List	No	No	The list of one or more databases to be created in the instance.	None
DBInstanceDescription	String	No	No	The description of the instance.	• The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). • It must start with a letter and cannot start with `http://` or `https://`.
ConnectionMode	String	No	No	The connection mode of the instance.	Valid values: • Performance: standard connection mode • Safty: safe connection mode If you do not specify this parameter, the system assigns a connection mode.
MasterUsername	String	No	No	The name of the database account.	The name must be unique. The name can be up to 16 characters in length and can contain letters, digits, and underscores (_).
MasterUserPassword	String	No	No	The password of the database account.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).
ZoneId	String	No	No	The zone ID of the instance.	None
DBInstanceNetType	String	No	No	The network type of the instance.	Default value: Intranet. Valid values: • Internet • Intranet
VSwitchId	String	No	No	The ID of the vSwitch in the specified VPC.	None
AllocatePublicConnection	Boolean	No	No	Specifies whether to apply for a public endpoint for the instance.	None

Property	Type	Required	Editable	Description	Constraint
PreferredBackupTime	String	No	No	The backup window.	• Specify the window in the `HH:mmZ-HH:mmZ` format. • Valid values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, 03:00Z-04:00Z, 04:00Z-05:00Z, 05:00Z-06:00Z, 06:00Z-07:00Z, 07:00Z-08:00Z, 08:00Z-09:00Z, 09:00Z-10:00Z, 10:00Z-11:00Z, 11:00Z-12:00Z, 12:00Z-13:00Z, 13:00Z-14:00Z, 14:00Z-15:00Z, 15:00Z-16:00Z, 16:00Z-17:00Z, 17:00Z-18:00Z, 18:00Z-19:00Z, 19:00Z-20:00Z, 20:00Z-21:00Z, 21:00Z-22:00Z, 22:00Z-23:00Z, and 23:00Z-24:00Z.
BackupRetentionPeriod	Number	No	No	The number of days for which backup files can be retained.	Valid values: 7 to 30. Unit: days. Default value: 7.
PrivateIpAddress	String	No	No	The private IP address within the CIDR block of the vSwitch.	If you do not specify this parameter, the system allocates a private IP address.
PreferredBackupPeriod	List	No	No	The backup cycle.	Valid values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday
MasterUserType	String	No	No	The type of the database account.	Default value: Normal. Valid values: • Normal • Super
Tags	Map	No	Yes	The list of one or more tags. Each tag consists of a tag key and a tag value.	• The tag key is required and the tag value is optional. • Format example: `{"key1":"value1","key2":""}`.
PeriodType	String	No	No	The unit of the subscription period.	Default value: Month. Valid values: • Month • Year

Property	Type	Required	Editable	Description	Constraint
PayType	String	No	No	The billing method of the instance.	Valid values: • PostPaid: pay-as-you-go • PrePaid: subscription
Period	Integer	No	No	The subscription period of the instance.	• Valid values when PeriodType is set to Year: 1, 2, and 3. • Valid values when PeriodType is set to Month: 1, 2, 3, 4, 5, 6, 7, 8, and 9.

DBMappings syntax

```
"DBMappings": [
  {
    "DBDescription": String,
    "CharacterSetName": String,
    "DBName": String
  }
]
```

DBMappings properties

Property	Type	Required	Editable	Description	Constraint

CharacterSetName	String	Yes	No	The character set.	• Valid values when Engine is set to MySQL:
					  ○ utf8
					  ○ gbk
					  ○ latin1
					  ○ utf8mb4 (applicable to versions 5.5 and 5.6)
					• Valid values when Engine is set to SQLServer:
					  ○ Chinese_PRC_CI_AS
					  ○ Chinese_PRC_CS_AS
					  ○ SQL_Latin1_General_CP1_CI_AS
					  ○ SQL_Latin1_General_CP1_CS_AS
					  ○ Chinese_PRC_BIN

DBName	String	Yes	No	The name of the database.	The name must be unique. The name can be up to 64 characters in length and can contain letters, digits, and underscores (_). It must start with a letter.

Property	Type	Required	Editable	Description	Constraint
DBDescription	String	No	No	The description of the database.	• The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). • It must start with a letter and cannot start with `http://` or `https://`.

Response parameters

Fn::GetAtt

- DBInstanceId: the ID of the instance.
- InnerPort: the internal port of the instance.
- InnerIPAddress: the internal IP address of the instance.
- InnerConnectionString: the internal endpoint of the instance.
- PublicPort: the public port of the instance.
- PublicConnectionString: the public endpoint of the instance.
- PublicIPAddress: the public IP address of the instance.

Examples

The following example demonstrates how to create an ApsaraDB RDS instance in the classic network:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine": "MySQL",
        "EngineVersion": "5.6",
        "DBInstanceClass":"rds.mysql.t1.small",
        "DBInstanceStorage": 10,
        "DBInstanceNetType": "Internet",
        "SecurityIPList": "0.0.0.0/0",
        "MasterUsername": "A****",
        "DBMappings":[{
            "DBName": "hope",
            "CharacterSetName": "utf8"
        }]
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {"get_attr": ["DBInstanceId"]}
    },
    "PublicConnectionString": {
      "Value": {"get_attr": ["ConnectionString"]}
    },
    "PublicPort": {
      "Value": {"get_attr": ["Port"]}
    }
  }
}
```

The following example demonstrates how to create an ApsaraDB RDS instance in a VPC:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine":"MySQL",
        "EngineVersion":"5.6",
        "DBInstanceClass":"rds.mys2.small",
        "DBInstanceStorage":"10",
        "DBInstanceNetType":"Intranet",
        "SecurityIPList": "0.0.0.0/0",
        "VSwitchId": "ttt",
        "VpcId": "myvp****"
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {"get_attr": ["DBInstanceId"]}
    },
    "InnerConnectionString": {
      "Value": {"get_attr": ["ConnectionString"]}
    },
    "InnerPort": {
      "Value": {"get_attr": ["Port"]}
    }
  }
}
```

5.1.6.5.4. ALIYUN::RDS::DBInstanceParameterGroup

ALIYUN::RDS::DBInstanceParameterGroup is used to modify parameters of an ApsaraDB RDS instance.

Syntax

```
{
  "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
  "Properties": {
    "Forcerestart": String,
    "DBInstanceId": String,
    "Parameters": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
DBInstanceId	String	Yes	No	The ID of the ApsaraDB RDS instance.	None

Property	Type	Required	Editable	Description	Constraint
Parameters	List	Yes	No	The list of one or more parameters of the instance.	The parameters and their values must be arranged in the JSON format. The parameter values must be of the string type. Example: {"auto_increment_increment":"1","character_set_client":"utf8"}.
Forcerestart	String	No	No	Specifies whether to forcibly restart the instance.	Default value: false. Valid values: • true: The system forcibly restarts the instance. • false: The system does not forcibly restart the instance.

Response parameters

Fn::GetAtt

None

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Database": {
      "Type": "ALIYUN::RDS::DBInstance",
      "Properties": {
        "Engine": "MySQL",
        "EngineVersion": "5.6",
        "DBInstanceClass": "rds.mys2.small",
        "DBInstanceStorage": "10",
        "DBInstanceNetType": "Intranet",
        "SecurityIPList": "0.0.0.0/0"
      }
    },
    "DatabaseConfig": {
      "Type": "ALIYUN::RDS::DBInstanceParameterGroup",
      "Properties": {
        "DBInstanceId": {
          "Ref": "Database"
        },
        "Parameters": [
          {
            "Key": "auto_increment_increment",
            "Value": "xxx"
          }
        ]
      }
    }
  },
  "Outputs": {
    "DBInstanceId": {
      "Value": {
        "Fn::GetAtt": [
          "Database",
          "DBInstanceId"
        ]
      }
    }
  }
}
```

5.1.6.5.5. ALIYUN::RDS::DBInstanceSecurityIps

ALIYUN::RDS::DBInstanceSecurityIps is used to modify the instance whitelist.

Statement

```
{
  "Type": "ALIYUN::RDS::DBInstanceSecurityIps",
  "Properties": {
    "DBInstanceId": String,
    "DBInstanceIPArrayName": String,
    "DBInstanceIPArrayAttribute": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
DBInstanceId	String	No	No	The ID of the RDS instance.	None
DBInstanceIPArrayAttribute	String	No	Yes	The attribute of the IP address whitelist.	The console does not display groups labeled with hidden.
DBInstanceIPArrayName	String	Yes	Released	The name of the IP address whitelist.	The name can contain only lowercase letters and underscores (_). Default value: Default.

Response parameters

Fn::GetAtt

SecurityIps: the IP address whitelist after the modification.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "DBInstanceSecurityIps": {
      "Type": "ALIYUN::RDS::DBInstanceSecurityIps",
      "Properties": {
        "DBInstanceIPArrayName": {
          "Ref": "DBInstanceIPArrayName"
        },
        "DBInstanceId": [
          "Ref": "DBInstanceId"
        },
        "DBInstanceIPArrayAttribute": {
          "Ref": "DBInstanceIPArrayAttribute"
        }
      }
    }
  },
  "Parameters": {
    "DBInstanceIPArrayName": {
      "Type": "String",
      "Description": "Group name of the security ips, only support lower characters and '_'. Advice use a new group name avoid effect your database system. If the properties is not specified, it will set to default group, please be careful."
    },
    "DBInstanceId": [
      "Type": "String",
      "Description": "Database instance id to update security ips."
    },
    "DBInstanceIPArrayAttribute": {
      "Type": "String",
      "Description": "Security ips to add or remove."
    }
  },
  "Outputs": {
    "SecurityIps": {
      "Description": "The security ips of selected database instance.",
      "Value": {
        "Fn::GetAtt": [
          "DBInstanceSecurityIps",
          "SecurityIps"
        ]
      }
    }
  }
}
```

5.1.6.5.6. ALIYUN::RDS::PrepayDBInstance

ALIYUN::RDS::PrepayDBInstance is used to create a subscription ApsaraDB RDS instance.

Syntax

```
{
  "Type": "ALIYUN::RDS::PrepayDBInstance",
  "Properties": {
    "DBMappings": List,
    "CouponCode": String,
    "MasterUsername": String,
    "PeriodType": String,
    "PayType": String,
    "DBInstanceNetType": String,
    "MasterUserType": String,
    "AutoRenew": Boolean,
    "PreferredBackupTime": String,
    "PrivateIpAddress": String,
    "Engine": String,
    "MultiAZ": Boolean,
    "VpcId": String,
    "ConnectionMode": String,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "BackupRetentionPeriod": Number,
    "Quantity": Number,
    "CommodityCode": String,
    "ZoneId": String,
    "AutoPay": Boolean,
    "EngineVersion": String,
    "DBInstanceClass": String,
    "PreferredBackupPeriod": List,
    "DBInstanceStorage": Integer,
    "DBInstanceDescription": String,
    "Tags": Map,
    "Period": Number,
    "MasterUserPassword": String,
    "AllocatePublicConnection": Boolean
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
DBMappings	List	No	No	The list of one or more databases to be created in the instance.	None
CouponCode	String	No	No	None	None
MasterUsername	String	No	No	The name of the database account.	The name must be unique. The name can be up to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter.

Property	Type	Required	Editable	Description	Constraint
PeriodType	String	Yes	No	The unit of the subscription period.	Default value: Month. Valid values: • Year • Month
DBInstanceNetType	String	No	No	The network type of the instance.	Default value: Intranet. Valid values: • Internet • Intranet
MasterUserType	String	No	No	The type of the database account.	Valid values: • Normal • Master
PreferredBackupTime	String	No	No	The backup window.	Specify the window in the HH:mmZ-HH:mmZ format. Value values: 00:00Z-01:00Z, 01:00Z-02:00Z, 02:00Z-03:00Z, 03:00Z-04:00Z, 04:00Z-05:00Z, 05:00Z-06:00Z, 06:00Z-07:00Z, 07:00Z-08:00Z, 08:00Z-09:00Z, 09:00Z-10:00Z, 10:00Z-11:00Z, 11:00Z-12:00Z, 12:00Z-13:00Z, 13:00Z-14:00Z, 14:00Z-15:00Z, 15:00Z-16:00Z, 16:00Z-17:00Z, 17:00Z-18:00Z, 18:00Z-19:00Z, 19:00Z-20:00Z, 20:00Z-21:00Z, 21:00Z-22:00Z, 22:00Z-23:00Z, and 23:00Z-24:00Z.
PrivateIpAddress	String	No	No	The private IP address with the CIDR block of the specified vSwitch.	If you do not specify this parameter, the system allocates a private IP address.
Engine	String	Yes	No	The database engine that the instance runs.	Valid values: • MySQL • SQLServer • PostgreSQL • PPAS

Property	Type	Required	Editable	Description	Constraint
MultiAZ	Boolean	No	No	Specifies whether the instance can be deployed across multiple zones.	None
VpcId	String	No	No	The ID of the VPC.	None
ConnectionMode	String	No	No	The connection mode of the instance.	Default value: Safty. Valid values: • Performance: the standard mode. • Safty: the database proxy mode. If you do not specify this parameter, the system assigns a connection mode.
AutoRenew	Boolean	No	No	Specifies whether to enable automatic renewal for the instance.	Valid values: • True • False
VSwitchId	String	No	No	The ID of the vSwitch in the specified VPC.	None
BackupRetentionPeriod	Number	No	No	The number of days for which backup files can be retained.	None
Quantity	Number	No	No	The number of instances to be created.	Valid values: 1 to 99. Default value: 1.
CommodityCode	String	Yes	No	The commodity code.	Valid values: • rds • bards • rords
ZoneId	String	No	No	The zone ID of the instance.	None
EngineVersion	String	Yes	No	The version of the database engine.	• Valid values when Engine is set to MySQL: 5.5 and 5.6. • Set the value to 2008r2 when Engine is set to SQLServer. • Set the value to 9.4 when Engine is set to PostgreSQL. • Set the value to 9.3 when Engine is set to PPAS.

Property	Type	Required	Editable	Description	Constraint
DBInstanceClass	String	Yes	Yes	The instance type.	Examples: rds.mys2.large, rds.mss1.large, and rds.pg.s1.small.
PreferredBackupPeriod	List	No	No	The backup cycle.	Valid values: • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday • Sunday
DBInstanceStorage	Integer	Yes	Yes	The storage capacity of the instance.	• Valid values when Engine is set to MySQL: 5 to 1000. • Valid values when Engine is set to SQLServer: 10 to 1000. • Valid values when Engine is set to PostgreSQL or PPAS: 5 to 2000. Unit: GB. This value must be in 5 GB increments.
DBInstanceDescription	String	No	No	The description of the instance.	The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
Tags	map	No	Yes	The tags of the instance.	None
Period	Number	Yes	No	The subscription period of the instance.	• Valid values when PeriodType is set to Month: 1, 2, 3, 4, 5, 6, 7, 8, and 9. • Valid values when PeriodType is set to Year: 1, 2, and 3.
MasterUserPassword	String	No	No	The password of the database account.	The password must be 6 to 32 characters in length and can contain letters, digits, and underscores (_).

Property	Type	Required	Editable	Description	Constraint
AllocatePublicConnection	Boolean	No	No	Specifies whether to apply for a public endpoint for the instance.	None
PayType	String	No	No	The billing method of the instance.	Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription
AutoPay	Boolean	No	No	Specifies whether to enable automatic payment for the instance.	Default value: False. Valid values: • True • False

DBMappings syntax

```
"DBMappings": [
  {
    "DBDescription": String,
    "CharacterSetName": String,

  }
]
```

DBMappings properties

Property	Type	Required	Editable	Description	Constraint
DBDescription	String	No	No	The description of the database.	The description must be 2 to 256 characters in length and can contain letters, digits, underscores (_), and hyphens (-). It must start with a letter and cannot start with `http://` or `https://`.
CharacterSetName	String	Yes	No	The character set.	• Valid values when Engine is set to MySQL: utf8, gbk, latin1, and utf8mb4 (applicable to versions 5.5 and 5.6). • Valid values when Engine is set to SQLServer: Chinese_PRC_CI_AS, Chinese_PRC_CS_AS, SQL_Latin1_General_CP1_CI_AS, SQL_Latin1_General_CP1_CS_AS, and Chinese_PRC_BIN.

Property	Type	Required	Editable	Description	Constraint
DBName	String	Yes	No	The name of the database.	The name must be unique. It can be up to 64 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter.

Response parameters

Fn::GetAtt

- InnerPort: the internal port of the instance.
- OrderId: the order ID of the instance.
- PublicConnectionString: the public endpoint of the instance.
- InnerIPAddress: the internal IP address of the instance.
- DBInstanceId: the ID of the instance.
- PublicIPAddress: the public IP address of the instance.
- PublicPort: the public port of the instance.
- InnerConnectionString: the internal endpoint of the instance.

5.1.6.6. ROS

5.1.6.6.1. ALIYUN::ROS::WaitCondition

ALIYUN::ROS::WaitCondition is used to create an instance to process UserData messages.

Statement

```
{
  "Type": "ALIYUN::ROS::WaitCondition",
  "Properties": {
    "Count": Number,
    "Handle": String,
    "Timeout": Number
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Handle	String	No	No	Reference ALIYUN::ROS::WaitConditionHandle.	None
Timeout	Number	Yes	No	The length of time to wait for UserData messages.	Valid values: 1 to 43200. Unit: seconds.
Count	Number	No.	True	The total number of messages to be received.	None

Response parameters

Fn::GetAtt

- Data: A JSON-serialized dictionary that contains the signal Data after the most recent stack creation or update.
- LastData: a JSON-serialized dictionary that contains the signal data before the most recent stack update.
- JoinedErrorData: a string consisting of the ErrorData signal data.
- JoinedLastErrorData: a string consisting of the LastErrorData signal data.
- ErrorData: a JSON-serialized dictionary that contains the error signal data after the most recent stack creation or update.
- Lasterprotodata: a JSON-serialized dictionary that contains the error signal data before the most recent stack update.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "WaitCondition": {
      "Type": "ALIYUN::ROS::WaitCondition",
      "Properties": {
        "Handle": {
          "Ref": "WaitConHandle"
        },
        "Timeout": 5,
        "Count": 2
      }
    },
    "WaitConHandle": {
      "Type": "ALIYUN::ROS::WaitConditionHandle"
    }
  },
  "Outputs": {
    "CurlCli": {
      "Value": {
        "Fn::GetAtt": [
          "WaitConHandle",
          "CurlCli"
        ]
      }
    },
    "Data": {
      "Value": {
        "Fn::GetAtt": [
          "WaitCondition",
          "Data"
        ]
      }
    }
  }
}
```

5.1.6.6.2. ALIYUN::ROS::WaitConditionHandle

ALIYUN::ROS::WaitConditionHandle is used to create an instance that sends and receives messages during UserData execution.

Statement

```
{
  "Type": "ALIYUN::ROS::WaitConditionHandle",
  "Properties": {
    "Count": Integer,
    "Mode": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Count	Integer	No.	True	The total number of messages to be received.	Default value: -1.
Mode	String	Yes	True	If you set this parameter to Increment, all previous signals will be updated before they are deleted. If you set this parameter to Full, no previous signals will be deleted unless the Count parameter is specified.	Valid values: • Increment • Full Default value: Full.

Response parameters

Fn::GetAtt

- CurlCli: A curl Command is generated by the resource. You can use the command to send the UserData execution result or status to Resource Orchestration Service.
- WindowsCurlCli: provides Windows with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Windows does not support the curl command. Therefore, you must install curl.exe and add it to PATH. You can add `--data-binary "{\"status\": \" success \"}` to indicate success, or by adding `--data-binary "{\"status\": \" failure \"}` to indicate failure.
- PowerShellCurlCli: provides PowerShell with cURL CLI command prefixes and sends a message indicating that the execution is completed or failed. Because this cmdlet was introduced in PowerShell 3.0, make sure that the PowerShell version meets this constraint. By `$PSVersionTable.PSVersion` displays the version. You can add `-Body '{"status": "success "}` to indicate success, or by adding `-Body '{"status": "failure "}` to indicate failure.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Mode": {
      "Type": "String",
      "Description": "If set to Increment, all old signals will be deleted before update. In this mode
, WaitCondition.Count should reference an incremental value instead of a full value, such as ScalingGr
oupEnable.ScalingRuleArisExecuteResultNumberOfAddedInstances.\n\nIf set to Full, no old signal will be
deleted unless Count is set. In this mode, WaitCondition.Count should reference a full value, such as
the same value with InstanceGroup.MaxAmount. It is recommended to use this mode with Count.\n\nDefault
to Full.",

          "Ref": "Mode"
        },
        "Count": {
          "Ref": "Count"
        }
      }
    }
  },
  "Outputs": {
    "CurlCli": {
      "Description": "Convenience attribute, provides curl CLI command prefix, which can be used for s
ignalling handle completion or failure.  You can signal success by adding --data-binary '{\"status\":
\"SUCCESS\"}' , or signal failure by adding --data-binary '{\"status\": \"FAILURE\"}'",
      "Value": {
        "Fn::GetAtt": [
          "WaitConditionHandle",
          "CurlCli"
        ]
      }
    },
    "WindowsCurlCli": {
      "Description": "Convenience attribute, provides curl CLI command prefix for Windows, which can b
e used for signalling handle completion or failure. As Windows does not support curl command, you need
to install curl.exe and add it to PATH first. You can signal success by adding --data-binary \"{\\\"st
atus\\\": \\\"SUCCESS\\\"}\" , or signal failure by adding --data-binary \"{\\\"status\\\": \\\"FAILUR
E\\\"}\" ",
      "Value": {
        "Fn::GetAtt": [
          "WaitConditionHandle",
          "WindowsCurlCli"
        ]
      }
    },
    "PowerShellCurlCli": {
      "Description": "Convenience attribute, provides curl CLI command prefix for PowerShell, which ca
n be used for signalling handle completion or failure. As this cmdlet was introduced in PowerShell 3.0
, ensure the version of PowerShell satisfies the constraint. (Show the version via $PSVersionTable.PSV
ersion.) You can signal success by adding -Body '{\"status\": \"SUCCESS\"}' , or signal failure by add
ing -Body '{\"status\": \"FAILURE\"}' ",
      "Value": {
        "Fn::GetAtt": [
          "WaitConditionHandle",
          "PowerShellCurlCli"
        ]
      }
    }
```

```
    }
}
```

5.1.6.6.3. ALIYUN::ROS::Stack

ALIYUN::ROS::Stack is used to create a nested stack. You can have a maximum of five nested levels.

ALIYUN::ROS::Stack is used in a top-level template to nest stacks as resources.

You can add output values from a nested stack contained within the template. You can use Fn::GetAtt together with the logical name of the nested stack and the output name in the Outputs.NestedStackOutputName format.

> **Note** We recommend that you run an update to the Nested stack from the parent stack.

When you apply a template change to update a top-level stack, ROS updates the top-level stack and initiates an update to its nested stacks. Resource orchestration service (ROS) updates resources that have been modified in the nested stack, but does not update resources that have not been modified in the nested stack.

Statement

```
{
  "Type": "ALIYUN::ROS::Stack",
  "Properties": {
    "TemplateURL": String,
    "TimeoutMins": Number,
    "Parameters": Map
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
TemplateURL	String	No	Yes	The URL of the file containing the template body. The template file can be up to 524,288 bytes in size. The URL must point to a template located on the http or https Web server or Alibaba Cloud OSS bucket. For example: `oss://ros/template/demo` , `oss://ros/template/demo?RegionId=cn-hangzhou` . If the region of the OSS bucket is not specified, the RegionId of the stack is used.	The URL can be up to 1,024 bytes in length.
TimeoutMins	Number	No.	True	The length of time that ROS will wait for the nested stack to be created or updated.	Unit: minutes. Default value: 60.

Parameter	Type	Required	Editable	Description	Constraint
Parameters	Map	No.	True	A set of value pairs that represent the parameters passed to ROS when this Nested stack is created. Each parameter has a name corresponding to a parameter defined in the embedded template and the value to which you want to set the parameter. This parameter is required if the nested stack needs input parameters.	None

Response parameters

Fn::GetAtt

You can use the following code to obtain the output of the nested stack:

```
{
  "Fn::GetAtt": [
    "<nested_stack>",
    "Outputs.<nested_stack_output_name>"
  ]
}
```

When you use `Ref` to reference resources in a nested stack, the Alibaba Cloud Resource Name (ARN) of the nested stack is returned. Example: `arn:acs:ros::cn-hangzhou:12345****:stacks/test-nested-stack-Demo-jzkyq7mn2ykj/e71c1e04-1a57-46fc-b9a4-cf7ce0d3****`

Examples

- The following code provides an example of how to create a VPC, a VSwitch, and a security group in a nested stack and save the output results to the *oss://ros/template/vpc.txt* directory:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Description": "One VPC, VSwitch, security group.",
  "Parameters": {
    "ZoneId": {
      "Type": "String",
      "Description": "The available zone"
    },
    "SecurityGroupName": {
      "Type": "String",
      "Description": "The security group name",
      "Default": "my-sg-name"
```

```
    },
    "VpcName": {
      "Type": "String",
      "Description": "The VPC name",
      "MinLength": 2,
      "MaxLength": 128,
      "ConstraintDescription": "[2, 128] English or Chinese letters",
      "Default": "my-vpc-name"
    },
    "VpcCidrBlock": {
      "Type": "String",
      "AllowedValues": [
        "192.168.0.0/16",
        "172.16.0.0/12",
        "10.0.0.0/8"
      ],
      "Default": "10.0.0.0/8"
    },
    "VSwitchCidrBlock": {
      "Type": "String",
      "Description": "The VSwitch subnet which must be within VPC",
      "Default": "10.0.10.0/24"
    },
    "UpdateVersion": {
      "Type": "Number",
      "Default": 0
    }
  },
  "Resources": {
    "Vpc": {
      "Type": "ALIYUN::ECS::VPC",
      "Properties": {
        "CidrBlock": {
          "Ref": "VpcCidrBlock"
        },
        "VpcName": {
          "Ref": "VpcName"
        }
      }
    },
    "VSwitch": {
      "Type": "ALIYUN::ECS::VSwitch",
      "Properties": {
        "CidrBlock": {
          "Ref": "VSwitchCidrBlock"
        },
        "ZoneId": {
          "Ref": "ZoneId"
        },
        "VpcId": {
          "Fn::GetAtt": [
            "Vpc",
            "VpcId"
          ]
        }
      }
    },
    "SecurityGroup": {
      "Type": "ALIYUN::ECS::SecurityGroup",
      "Properties": {
```

```
        "SecurityGroupName": {
          "Ref": "SecurityGroupName"
        },
        "VpcId": {
          "Ref": "Vpc"
        }
      }
    },
    "WaitConditionHandle": {
      "Type": "ALIYUN::ROS::WaitConditionHandle",
      "Properties": {
        "UpdateVersion": {
          "Ref": "UpdateVersion"
        }
      }
    }
  },
  "Outputs": {
    "SecurityGroupId": {
      "Value": {
        "Fn::GetAtt": [
          "SecurityGroup",
          "SecurityGroupId"
        ]
      }
    },
    "VpcId": {
      "Value": {
        "Fn::GetAtt": [
          "Vpc",
          "VpcId"
        ]
      }
    },
    "VSwitchId": {
      "Value": {
        "Fn::GetAtt": [
          "VSwitch",
          "VSwitchId"
        ]
      }
    }
  }
}
```

- The following code provides an example of a top-level stack:

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Description": "One ECS instance.",
  "Parameters": {
    "ImageId": {
      "Default": "centos_7",
      "Type": "String",
      "Description": "Image Id, represents the image resource to startup the ECS instance"
    },
    "InstanceType": {
      "Type": "String",
      "Description": "The ECS instance type,",
      "Default": "ecs.xn4.small"
```

```
    },
    "ZoneId": {
      "Type": "String",
      "Description": "The available zone "
    },
    "InstanceChargeType": {
      "Type": "String",
      "AllowedValues": [
        "PrePaid",
        "PostPaid"
      ],
      "Default": "PostPaid",
      "Description": "The instance charge type"
    },
    "SecurityGroupName": {
      "Type": "String",
      "Description": "The security group name",
      "Default": "my-sg-name"
    },
    "NetworkInterfaceName": {
      "Type": "String",
      "Description": "The Network interface name",
      "Default": "my-eni-name"
    },
    "VpcName": {
      "Type": "String",
      "Description": "The VPC name",
      "MinLength": 2,
      "MaxLength": 128,
      "ConstraintDescription": "[2, 128] English or Chinese letters",
      "Default": "my-vpc-name"
    },
    "IoOptimized": {
      "AllowedValues": [
        "none",
        "optimized"
      ],
      "Description": "IO optimized, optimized is for the IO optimized instance type",
      "Type": "String",
      "Default": "optimized"
    },

  }
}
```

5.1.6.7. SLB

5.1.6.7.1. ALIYUN::SLB::AccessControl

ALIYUN::SLB::AccessControl is used to create an access control list (ACL).

Syntax

```
{
  "Type": "ALIYUN::SLB::AccessControl",
  "Properties": {
    "AddressIPVersion": String,
    "AclName": String,
    "AclEntrys": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
AddressIPVersion	String	No	No	The Internet protocol version.	Valid values: ipv4 and ipv6.
AclName	String	Yes	Yes	The name of the ACL.	None
AclEntrys	List	No	No	The list of ACL entries.	A list can contain up to 50 ACL entries.

AclEntrys syntax

```
"AclEntrys": [
  {
    "comment": String,
    "entry": String
  }
]
```

AclEntrys properties

Property	Type	Required	Editable	Description	Constraint
comment	String	No	No	The comments on ACL entries.	None
entry	String	Yes	No	The authorized IP addresses or CIDR blocks.	None

Response parameters

Fn::GetAtt

AclId: the ID of the ACL.

Examples

Resource usage example

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AccessControl": {
      "Type": "ALIYUN::SLB::AccessControl",
      "Properties": {
        "AddressIPVersion": {
          "Ref": "AddressIPVersion"
        },
        "AclName": {
          "Ref": "AclName"
        },
        "AclEntrys": {
          "Fn::Split": [",", {
            "Ref": "AclEntrys"
          }, {
            "Ref": "AclEntrys"
          }]
        }
      }
    }
  },
  "Parameters": {
    "AddressIPVersion": {
      "Type": "String",
      "Description": "IP version. Could be \"ipv4\" or \"ipv6\".",
      "AllowedValues": ["ipv4", "ipv6"]
    },
    "AclName": {
      "Type": "String",
      "Description": "The name of the access control list."
    },
    "AclEntrys": {
      "Type": "CommaDelimitedList",
      "Description": "A list of acl entrys. Each entry can be IP addresses or CIDR blocks. Max length:
50.",
      "MaxLength": 50
    }
  },
  "Outputs": {
    "AclId": {
      "Description": "The ID of the access control list.",
      "Value": {
        "Fn::GetAtt": ["AccessControl", "AclId"]
      }
    }
  }
}
```

Example of combined use of SLB-related resources

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "slb-with-listener-and-acl",
        "AddressType": "internet",
```

```
        "InternetChargeType": "paybybandwidth",
        "Bandwidth": 10,
        "VpcId": "vpc-xxxxxxxxxxxxxxxxxxx",
        "VSwitchId": "vsw-xxxxxxxxxxxxxxxxxxx"
      }
    },
    "ACL": {
      "Type": "ALIYUN::SLB::AccessControl",
      "Properties": {
        "AclName": "acl-for-listener",
        "AddressIPVersion": "ipv4",
        "AclEntrys": [
          {
            "entry": "192.168.x.x"
          },
          {
            "entry": "10.0.x.x/24",
            "comment": "just comment"
          }
        ]
      }
    },
    "CreateListener": {
      "Type": "ALIYUN::SLB::Listener",
      "Properties": {
        "LoadBalancerId": {
          "Ref": "LoadBalancer"
        },
        "ListenerPort": "80",
        "BackendServerPort": 8080,
        "Bandwidth": 1,
        "Protocol": "http",
        "HealthCheck": {
          "HealthyThreshold": 3,
          "UnhealthyThreshold": 3,
          "Interval": 2,
          "Timeout": 5
        },
        "Scheduler": "wrr",
        "RequestTimeout": 179,
        "IdleTimeout": 59,
        "AclId": {
          "Ref": "ACL"
        },
        "AclStatus": "on",
        "AclType": "white"
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
      "Value": {
        "Fn::GetAtt": [
          "LoadBalancerId",
          "Listeners"
        ]
      }
    }
  }
}
```

5.1.6.7.2. ALIYUN::SLB::BackendServerAttachment

ALIYUN::SLB::BackendServerAttachment is used to add backend servers.

Statement

```
{
  "Type": "ALIYUN::SLB::BackendServerAttachment",
  "Properties": {
    "LoadBalancerId": String,
    "BackendServers": List,
    "BackendServerList": List,
    "BackendServerWeightList": List
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerId	String	No	No	The unique ID of the SLB instance.	None
BackendServerList	List	No.	True	The list of backend servers to add.	You can call this operation with LoadBalancerId and BackendServerWeightList. Separate ECS instance IDs with commas (,). This parameter is ignored when the BackendServers parameter is specified.

Parameter	Type	Required	Editable	Description	Constraint
BackendServerWeightList	List	No.	True	The weights of the ECS instances in the BackendServerList, which are specified in order.	If this parameter is not specified, the weight of all ECS instances included in the BackendServerList is 100. When the BackendServerWeightList length is less than BackendServerList, the last value in the BackendServerWeightList is used to weight the remaining ECS instances in the BackendServerList.
BackendServers	List	No.	True	The list of backend servers to add.	Only backend servers in the running state can be attached to the SLB instance.

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId" : String,
    "Weight" : Integer
  }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	The ECS instance must be in the Running state.
Weight	Integer	Retained	Yes	The weight of the ECS instance in the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

Fn::GetAtt

- BackendServers: the backend servers added to the SLB instance.

- LoadBalancerId: the ID of the SLB instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Attachment2": {
      "Type": "ALIYUN::SLB::BackendServerAttachment",
      "Properties": {
        "LoadBalancerId": "15187200816-cn-beijing-btc-****",
        "BackendServerList": [
          "i-25o0m****",
          "i-25zsk****"
        ],
        "BackendServerWeightList": [
          "20",
          "100"
        ]
      }
    }
  }
}
```

5.1.6.7.3. ALIYUN::SLB::BackendServerToVServerGroupAddition

ALIYUN::SLB::BackendServerToVServerGroupAddition is used to add backend servers to an existing VServer group.

Statement

```
{
  "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
  "Properties": {
    "BackendServers": List,
    "VServerGroupId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
VServerGroupId	String	No	No	The ID of the VServer group.	None
BackendServers	List	Retained	Yes	The list of ECS instances to be added.	None

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId": String,
    "Port": Integer,
    "Weight": Integer
  }
]
```

BackendServers properties

Parameter	Type	Required	Editable	Description	Constraint
ServerId	String	No	Yes	The ID of the ECS instance that acts as a backend server.	None
Port	Integer	Retained	Yes	The ECS port number that is listened to in the server load balancer instance.	Valid values: 1 to 65535.
Weight	Integer	Retained	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

VServerGroupId: the ID of the VServer group.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "AttachVServerGroup": {
      "Type": "ALIYUN::SLB::BackendServerToVServerGroupAddition",
      "Properties": {
        "VServerGroupId": "sg-2zenh4ndwrqg14yt0****",
        "BackendServers": [
          {
            "ServerId": "i-25zsk****",
            "Weight": 20,
            "Port": 8080
          },
          {
            "ServerId": "i-25zsk****",
            "Weight": 100,
            "Port": 8081
          }
        ]
      }
    }
  }
}
```

5.1.6.7.4. ALIYUN::SLB::Certificate

ALIYUN::SLB::Certificate is used to upload a certificate to an SLB instance. Server certificates and CA certificates are supported.

> **Notice**
> - You can upload only one CA certificate at a time ("CertificateType": "CA ").
> - You can upload only one server certificate and the corresponding private key at a time ("CertificateType": "Server ").

Syntax

```
{
  "Type": "ALIYUN::SLB::Certificate",
  "Properties": {
    "CertificateName": String,
    "Certificate": String,
    "AliCloudCertificateName": String,
    "PrivateKey": String,
    "ResourceGroupId": String,
    "CertificateType": String,
    "AliCloudCertificateId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None
CertificateName	String	No	Yes	The name of the certificate.	None
Certificate	String	Yes	No	The public key of the certificate.	None
AliCloudCertificateName	String	No	No	The name of the Alibaba Cloud certificate.	None
PrivateKey	String	No	No	The server private key that you want to upload.	None
AliCloudCertificateId	String	No	No	The ID of the Alibaba Cloud certificate.	This parameter is required if you use a certificate from Alibaba Cloud SSL Certificates Service.
CertificateType	String	No	No	The type of the certificate.	Valid values: Server and CA.

Response parameters

Fn::GetAtt

- CertificateId: the ID of the certificate.
- Fingerprint: the fingerprint of the certificate.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "CertificateType": {
      "Type": "String",
      "Description": "The type of the certificate.",
      "AllowedValues": [
        "Server",
        "CA"
      ],
      "Default": "Server"
    },
    "AliCloudCertificateName": {
      "Type": "String",
      "Description": "The name of the Alibaba Cloud certificate."
    },
    "PrivateKey": {
      "Type": "String",
      "Description": "The private key."
    }
```

```
    },
    "CertificateName": {
      "Type": "String",
      "Description": "The name of the certificate."
    },
    "Certificate": {
      "Type": "String",
      "Description": "The content of the certificate public key."
    },
    "AliCloudCertificateId": {
      "Type": "String",
      "Description": "The ID of the Alibaba Cloud certificate."
    }
  },
  "Resources": {
    "Certificate": {
      "Type": "ALIYUN::SLB::Certificate",
      "Properties": {
        "CertificateType": {
          "Ref": "CertificateType"
        },
        "AliCloudCertificateName": {
          "Ref": "AliCloudCertificateName"
        },
        "PrivateKey": {
          "Ref": "PrivateKey"
        },
        "CertificateName": {
          "Ref": "CertificateName"
        },
        "Certificate": {
          "Ref": "Certificate"
        },
        "AliCloudCertificateId": {
          "Ref": "AliCloudCertificateId"
        }
      }
    }
  },
  "Outputs": {
    "Fingerprint": {
      "Description": "The fingerprint of the certificate.",
      "Value": {
        "Fn::GetAtt": [
          "Certificate",
          "Fingerprint"
        ]
      }
    },
    "CertificateId": {
      "Description": "The ID of the certificate.",
      "Value": {
        "Fn::GetAtt": [
          "Certificate",
          "CertificateId"
        ]
      }
    }
  }
}
```

5.1.6.7.5. ALIYUN::SLB::DomainExtension

ALIYUN::SLB::DomainExtension is used to create a domain extension for an SLB instance.

Statement

```
{
  "Type": "ALIYUN::SLB::DomainExtension",
  "Properties": {
    "Domain": String,
    "ListenerPort": Integer,
    "ServerCertificateId": String,
    "LoadBalancerId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	No	No	The custom domain name.	None
ListenerPort	Integer	Yes	No	The frontend port used by the HTTPS listener of the SLB instance.	Valid values: 1 to 65535.
ServerCertificateId	String	No	Yes	The ID of the certificate corresponding to the domain name.	None
LoadBalancerId	String	No	No	The ID of the SLB instance.	None

Response parameters

Fn::GetAtt

- DomainExtensionId: the ID of the created domain extension.
- ListenerPort: The frontend port used by the SLB instance.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "DomainExtension": {
      "Type": "ALIYUN::SLB::DomainExtension",
      "Properties": {
        "Domain": "*.example.com",
        "ListenerPort": "443",
        "ServerCertificateId": "123157908552****_166f8204689_1714763408_70998****",
        "LoadBalancerId": "lb-bp1o94dp5i6earr9g****"
      }
    }
  },
  "Outputs": {
    "DomainExtensionId": {
      "Value": {
        "Fn::GetAtt": [
          "DomainExtension",
          "DomainExtensionId"
        ]
      }
    },
    "ListenerPort": {
      "Value": {
        "Fn::GetAtt": [
          "DomainExtension",
          "ListenerPort"
        ]
      }
    }
  }
}
```

5.1.6.7.6. ALIYUN::SLB::Listener

ALIYUN::SLB::Listener is used to create a listener for an SLB instance.

Statement

```
{
  "Type": "ALIYUN::SLB::Listener",
  "Properties": {
    "MasterSlaveServerGroupId": String,
    "AclStatus": String,
    "Protocol": String,
    "AclId": String,
    "ServerCertificateId": String,
    "HealthCheck": Map,
    "RequestTimeout": Integer,
    "IdleTimeout": Integer,
    "ListenerPort": Integer,
    "HttpConfig": Map,
    "Bandwidth": Integer,
    "AclType": String,
    "BackendServerPort": Integer,
    "Scheduler": String,
    "LoadBalancerId": String,
    "CACertificateId": String,
    "Persistence": Map,
    "VServerGroupId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupId	String	Yes	Released	The ID of the active/standby server group.	None
AclStatus	String	Yes	Released	Specifies whether to enable access control on the listener.	Valid values: • on • off Default value: off.
AclId	String	Yes	Released	The ID of the access control list (ACL) to which the listener is bound. This parameter is required when the AclStatus parameter is set to on.	None
				The type of the ACL. Valid values: white and black. • white: specifies the ACL as a whitelist. Only	

Parameter	Type	Required	Editable	Description	Constraint
AclType	String	Yes	Released	requests from the IP addresses or CIDR blocks specified in the ACL are forwarded. Whitelists are applicable to scenarios where you want an application to only be accessed from specific IP addresses. Configuring a whitelist poses risks to your services. After a whitelist is configured, only the IP addresses specified in the whitelist are able to access the SLB listener. If a whitelist is enabled without any IP addresses specified, the SLB listener will not forward any requests. • black: specifies the ACL as a blacklist. Requests from the IP addresses or CIDR blocks specified in the ACL are not forwarded. Blacklists are applicable to scenarios where you want an application to only be denied access from specific IP addresses.	Valid values: • White • Black

Parameter	Type	Required	Editable	Description	Constraint
				If a blacklist is enabled without any IP addresses specified, the SLB listener will forward all requests. This parameter is required when the AclStatus parameter is set to on.	
Protocol	String	No	No	The Internet protocol over which the listener will forward requests.	Valid values: • http • https • tcp • udp
ListenerPort	Integer	Yes	No	The frontend port used by the SLB instance.	Valid values: 1 to 65535.

Parameter	Type	Required	Editable	Description	Constraint
Bandwidth	Integer	Yes	No	The peak bandwidth of the listener. Unit: Mbit/s.	• Valid values: -1 and 1 to 1000. • For an SLB instance that is connected to the Internet and billed by fixed bandwidth, this parameter cannot be set to -1, and the sum of peak bandwidth values assigned to different listeners cannot exceed the Bandwidth value specified when the SLB instance is created. For an SLB instance that is connected to the Internet and billed by traffic, this parameter can be set to -1. Unit: Mbit/s.
BackendServerPort	Integer	Yes	No	The backend port used by the SLB instance.	Valid values: 1 to 65535.
LoadBalancerId	String	No	No	The ID of the SLB instance.	None
HealthCheck	Map	Erased	Released	The health check settings of the listener.	None
Persistence	Map	Erased	Released	The persistence properties.	None

Parameter	Type	Required	Editable	Description	Constraint
Scheduler	String	Yes	Released	The algorithm used to direct traffic to individual servers.	Valid values: • wrr • wlc Default value: wrr
CACertificateId	String	Yes	Released	The ID of the CA certificate.	Only valid for. HTTPS
ServerCertificateId	String	Yes	Released	The ID of the server certificate.	This parameter is required and valid only for HTTPS listeners.
VServerGroupId	String	Yes	Released	The ID of the VServer group.	None
RequestTimeout	String	Optional	Released	The request timeout period. Unit: seconds.	Valid values: 1 to 180.
IdleTimeout	String	Optional	Released	The idle connection timeout period. Unit: seconds.	Valid values: 1 to 60.
HttpConfig	Map	Erased	Released	The HTTP configurations.	None

HealthCheck syntax

```
"HealthCheck": {
  "Domain": String,
  "Interval": Integer,
  "URI": String,
  "HttpCode": String,
  "HealthyThreshold": Integer,
  "Timeout": Integer,
  "UnhealthyThreshold": Integer,
  "Port": Integer
}
```

HealthCheck properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Domain	String	Yes	Released	The domain name used for health checks.	• The value can be $_ip, a custom string, or an empty string. • A custom string must be 1 to 80 characters in length and can contain only letters, digits, hyphens (-), and periods (.). • When this parameter is set to $_ip or left empty, the SLB instance uses the private IP addresses of backend servers as the domain names for health checks.
Interval	String	Optional	Released	The time interval between consecutive health checks. Unit: seconds.	Valid values: 1 to 5. Unit: seconds.

Parameter	Type	Required	Editable	Description	Constraint
URI	String	Yes	Released	The URI used for health checks.	• The URI must be 1 to 80 characters in length • and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), percent signs (%), question marks (?), number signs (#), and ampersands (&). It must start with a forward slash (/).
HttpCode	String	Yes	Released	The HTTP status code that indicates a positive health status of the backend servers.	• Valid values: http_2xx, http_3xx, http_4xx, and http_5xx. • Separate multiple HTTP status codes with commas (,). Default value: http_2xx
HealthyThreshold	String	Optional	Released	The threshold used to determine that the backend servers are healthy. This value indicates the number of consecutive successful health checks required before the health status of a backend server can be changed from fail to success.	Valid values: 1 to 10.

Parameter	Type	Required	Editable	Description	Constraint
Timeout	String	Optional	Released	The length of time to wait for the response from a health check. Unit: seconds.	Valid values: 1 to 50. **Notice** This parameter is valid only when its value is greater than or equal to that of the Interval parameter. Otherwise, this parameter will be overridden by the Interval value.
UnhealthyThreshold	String	Optional	Released	The threshold used to determine that the backend servers are unhealthy. This value indicates the number of consecutive failed health checks required before the health status of a backend server can be changed from success to fail.	Valid values: 1 to 10.
Port	String	Optional	Released	The port used for health checks.	Valid values: 0 to 65535.

Persistence syntax

```
"Persistence": {
  "PersistenceTimeout": Integer,
  "CookieTimeout": Integer,
  "XForwardedFor": String,
  "Cookie": String,
  "StickySession": String,
  "StickySessionType": String
}
```

Persistence properties

Parameter	Type	Required	Editable	Description	Constraint
StickySession	String	No	No	Specifies whether to enable session persistence.	Valid values: • on • off
PersistenceTimeout	String	Optional	Released	The maximum duration that the client can be connected to the server. Unit: seconds.	Valid values: 0 to 1000. The default value is 0, which indicates that connection persistence is disabled. Unit: seconds.
CookieTimeout	String	Optional	Released	The maximum duration the cookie can be retained before it expires. Unit: seconds.	This parameter is required when the StickySession parameter is set to on and the StickySessionType parameter is set to insert. Valid values: 1 to 86400. Unit: seconds.
XForwardedFor	String	Yes	Released	Specifies whether to use the X-Forwarded-For header field to obtain the real IP address of the client.	Valid values: • on • off Default value: on

Parameter	Type	Required	Editable	Description	Constraint
Cookie	String	Yes	Released	The cookie configured on the backend server.	• The parameter value must be 1 to 200 characters in length and follow the RFC 2965 standard. It can contain only ASCII characters. It cannot contain commas (,), semicolons (;), or spaces, and cannot start with a dollar sign ($). • This parameter is required when the StickySession parameter is set to on and the StickySession Type parameter is set to server.

Parameter	Type	Required	Editable	Description	Constraint
StickySessionType	String	Yes	Released	The method for processing cookies.	• Valid values: insert and server. • When this parameter is set to insert, SLB adds a cookie to the first response from the backend server. Then, the next request contains the cookie and the listener distributes the request to the same backend server. When this parameter is set to server, SLB overwrites the original cookie when a new cookie is set. The next time the client carries the new cookie to access SLB, the listener distributes the request to the previously recorded backend server. • This parameter is required when the StickySession parameter is set to on. This parameter is ignored when the StickySession parameter is set to off.

HttpConfig syntax

```
"HttpConfig": {
  "ForwardPort": Integer,
  "ListenerForward": String
}
```

HttpConfig properties

Parameter	Type	Required	Editable	Description	Constraint
ForwardPort	String	Optional	Released	The port used to redirect HTTP requests to HTTPS.	Valid values: 1 to 65535. Default value: 443.
ListenerForward	String	No	No	Specifies whether to enable HTTP-to-HTTPS redirection.	Valid values: • on • off Default value: off.

Response parameters

Fn::GetAtt

- LoadBalancerId: the unique ID of the SLB instance.
- ListenerPortsAndProtocol: an array consisting of the ports and protocols used by the SLB listener.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "LoadBalancer": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "createdByHeat",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth"
      }
    },
    "CreateListener": {
      "Type": "ALIYUN::SLB::Listener",
      "Properties": {
        "LoadBalancerId": {"Ref": "LoadBalancer"},
        "ListenerPort": "8094",
        "BackendServerPort": 8080,
        "Bandwidth": 1,
        "Protocol": "http",
        "HealthCheck": {
          "HealthyThreshold": 3,
          "UnhealthyThreshold": 3,
          "Interval": 2,
          "Timeout": 5,
          "HttpCode": "http_2xx,http_3xx,http_4xx,http_5xx"
        },
        "Scheduler": "wrr",
          "Persistence": {
          "PersistenceTimeout": 1,
          "XForwardedFor": "on",
          "StickySession": "on",
          "StickySessionType": "insert",
          "CookieTimeout": 10,
          "Cookie": "1"
        }
      }
    }
  },
  "Outputs": {
  "LoadBalanceDetails": {
     "Value": {"Fn::GetAtt": ["LoadBalancer", "LoadBalancerId"]}
  }
  }
}
```

5.1.6.7.7. ALIYUN::SLB::LoadBalancer

ALIYUN::SLB::LoadBalancer is used to create an SLB instance.

Statement

```
{
  "Type": "ALIYUN::SLB::LoadBalancer",
  "Properties": {
    "DeletionProtection": Boolean,
    "AddressType": String,
    "Tags": List,
    "InternetChargeType": String,
    "Bandwidth": Integer,
    "SlaveZoneId": String,
    "ResourceGroupId": String,
    "AutoPay": Boolean,
    "VpcId": String,
    "PricingCycle": String,
    "LoadBalancerName": String,
    "Duration": Number,
    "VSwitchId": String,
    "LoadBalancerSpec": String,
    "MasterZoneId": String,
    "PayType": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
DeletionProtection	Boolean	Erased	Released	Specifies whether to enable deletion protection to prevent the SLB instance from being deleted by mistake.	Valid values: • true • false
VpcId	String	Yes	Released	The ID of the VPC.	None
SlaveZoneId	String	Yes	Released	The ID of the secondary zone to which the SLB instance belongs.	None

Parameter	Type	Required	Editable	Description	Constraint
Bandwidth	String	Optional	Released	The peak bandwidth of SLB instances that are connected to the Internet and billed by fixed bandwidth.	For SLB instances that are connected to the Internet and billed by fixed Bandwidth, this parameter is valid only when the Bandwidth parameter of the SLB Listener is specified. For Internet instances whose billing type is to pay by traffic, we recommend that you set the peak Bandwidth through the Listener parameter. In this case, this parameter is ignored. Valid values: 1 to 1000. Unit: Mbps. Default value: 1 VPC-type instances are billed by traffic.
AddressType	String	Yes	Released	The address type of the SLB instance.	Valid values: • internet • intranet Default value: internet.
VSwitchId	String	Yes	Released	The ID of the vSwitch in the VPC.	None

Parameter	Type	Required	Editable	Description	Constraint
LoadBalancerName	String	Yes	Released	The name of the SLB instance to be created.	A custom string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_). If this parameter is not specified, the system assigns a value.
InternetChargeType	String	Yes	Released	The billing method of SLB instances that are connected to the Internet.	Valid values: • paybybandwidth • paybytraffic Default value: paybytraffic.
MasterZoneId	String	Yes	Released	The ID of the primary zone to which the SLB instance belongs.	None
Tags	List	Erased	Released	The tags to be attached to the SLB instance. The tags are listed in JSON format. Each tag consists of a TagKey and a TagValue.	A maximum of five tags can be attached to an SLB instance.
LoadBalancerSpec	String	Yes	Released	The type of the SLB instance.	Valid values: • slb.s1.small • slb.s2.small • slb.s2.medium • slb.s3.small • slb.s3.medium • slb.s3.large The available types vary by region.

Parameter	Type	Required	Editable	Description	Constraint
AutoPay	Boolean	Erased	Released	Specifies whether to automatically pay for subscription SLB instances that are connected to the Internet.	Valid values: • true • false Default value: false. **Note** This parameter is valid only on the China site (aliyun.com).
PayType	String	Yes	Released	The billing method of the SLB instance.	Valid values: • PayOnDemand • PrePay
PricingCycle	String	Yes	Released	The billing cycle of subscription SLB instances that are connected to the Internet.	Valid values: • month • year **Note** This parameter is valid only on the China site (aliyun.com).

Parameter	Type	Required	Editable	Description	Constraint
Duration	Number	Erased	Released	The subscription period of subscription SLB instances that are connected to the Internet.	Valid values: • Valid values when the PricingCycle parameter is set to month: 1 to 9. • Valid values when the PricingCycle parameter is set to year: 1 to 3. **Note** This parameter is valid only on the China site (aliyun.com).

Tags syntax

```
"Tags": [
  {
    "Value": String ,
    "Key": String
  }
]
```

Tags properties

Property	Type	Required or Not	Editable	Description	Constraint
Key	String	No	No	None	None
Value	String	Yes	Released	None	Valid values: 1025 to 10000. You cannot use the following commonly used port numbers: 2222, 4500, 4510, 4560, 7505, 9000, 9001, and 9002.

Response parameters

Fn::GetAtt

- LoadBalancerId: the unique ID of the SLB instance.
- NetworkType: the network type of the SLB instance, which can be vpc or classic.

- AddressType: the address type of the SLB instance, which can be intranet or internet.
- IpAddress: the IP address of the SLB instance.
- OrderId: the ID of the order.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "CreateLoadBalance": {
      "Type": "ALIYUN::SLB::LoadBalancer",
      "Properties": {
        "LoadBalancerName": "createdByHeat",
        "AddressType": "internet",
        "InternetChargeType": "paybybandwidth",
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
      "Value": {
        "Fn::GetAtt": ["CreateLoadBalance", "LoadBalancerId"]}
    }
  }
}
```

5.1.6.7.8. ALIYUN::SLB::LoadBalancerClone

ALIYUN::SLB::LoadBalancerClone is used to clone an SLB instance.

Syntax

```
{
  "Type": "ALIYUN::SLB::LoadBalancerClone",
  "Properties": {
    "Tags": List,
    "ResourceGroupId": String,
    "VSwitchId": String,
    "LoadBalancerName": String,
    "SourceLoadBalancerId": String,
    "TagsPolicy": String,
    "BackendServersPolicy": String,
    "BackendServers": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	No	No	The ID of the resource group.	None

Property	Type	Required	Editable	Description	Constraint
VSwitchId	String	No	No	The ID of the VSwitch.	The VSwitch must exist in the VPC to which the source SLB instance belongs. If the parameter is not specified, the VSwitch to which the source SLB instance belongs is used.
SourceLoadBalancerId	String	Yes	No	The ID of the SLB instance to be cloned.	None

Property	Type	Required	Editable	Description	Constraint
BackendServersPolicy	String	No	No	The clone policy. The ECS instances listened by the new SLB instance and the weight of each ECS instance are specified in the policy.	Valid values: • clone: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. • empty: No ECS instances are attached to the new SLB instance. • append: The ECS instances listened by the source SLB instance and the ECS instance weights are cloned to the new SLB instance. New ECS instances with specified weights are also attached to the new SLB instance. • replace: New ECS instances with specified weights are attached to the new SLB instance. However, the ECS instances listened by the source SLB instance and the ECS instance weights are not cloned to the new SLB instance. Default value: clone.

Property	Type	Required	Editable	Description	Constraint
BackendServers	List	No	Yes	The new ECS instances to be listened.	None
LoadBalancerName	String	No	No	The name of the new SLB instance.	You can set the name to any string. The name must be 1 to 80 characters in length and can contain letters, digits, hyphens (-), forward slashes (/), periods (.), and underscores (_).
Tags	List	No	Yes	The tags of the SLB instance.	Tags must be specified as key-value pairs. A maximum of five tags can be specified.
TagsPolicy	String	No	No	The policy of the tags.	Valid values: • clone: The tags of the source SLB instance are used. • empty: No tags are configured. • append: The tags of the source SLB instance are reserved while new tags are added. • replace: The tags of the source SLB instance are deleted while new tags are added. Default value: empty.

BackendServers syntax

```
"BackendServers": [
  {
    "ServerId": String,
    "Weight": Integer
  }
]
```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	The ECS instances must be in the running state.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100. Default value: 100.

Response parameters

Fn::GetAtt

LoadBalancerId: the ID of the new SLB instance.

Examples

```
{
  "ROSTemplateFormatVersion" : "2015-09-01",
  "Resources" : {
    "CloneLoadBalance": {
      "Type": "ALIYUN::SLB::LoadBalancerClone",
      "Properties": {
        "SourceLoadBalancerId": "150ebed5f06-cn-beijing-btc-***",
        "LoadBalancerName": "rosnew",
        "BackendServersPolicy": "replace",
        "BackendServers": [
            {
                "ServerId": "i-25zsk****",
                "Weight": 20
            }
        ]
      }
    }
  },
  "Outputs": {
    "LoadBalanceDetails": {
         "Value" : {"Fn::GetAtt": ["CloneLoadBalance", "LoadBalancerId"]}
    }
  }
}
```

5.1.6.7.9. ALIYUN::SLB::MasterSlaveServerGroup

ALIYUN::SLB::MasterSlaveServerGroup is used to create a primary/secondary server group.

> **Notice** A primary/secondary server group contains only two ECS instances: a primary server and a secondary server.

Syntax

```
{
  "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
  "Properties": {
    "MasterSlaveServerGroupName": String,
    "MasterSlaveBackendServers": List,
    "LoadBalancerId": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
MasterSlaveServerGroupName	String	No	No	The name of the primary/secondary server group.	None
MasterSlaveBackendServers	List	Yes	No	The list of backend servers in the primary/secondary server group.	A primary/secondary server group can contain a maximum of two backend servers. If you do not specify this parameter, an empty primary/secondary server group is created.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

MasterSlaveBackendServers syntax

```
"MasterSlaveBackendServers": [
  {
    "ServerId": String,
    "Port": Integer,
    "Weight": Integer,
    "ServerType": String
  }
]
```

MasterSlaveBackendServers properties

Property	Type	Required	Editable	Description	Constraint

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	No	The ID of the ECS instance or Elastic Network Interface (ENI) to be added.	None
ServerType	String	No	No	The type of the server.	Default value: Master. Valid values: • Master • Slave
Port	Integer	Yes	No	The port number used by the backend server.	Valid values: 1 to 65535.
Weight	Integer	Yes	No	The weight of the backend server.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

MasterSlaveServerGroupId: the ID of the primary/secondary server group.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "MasterSlaveServerGroup": {
      "Type": "ALIYUN::SLB::MasterSlaveServerGroup",
      "Properties": {
        "MasterSlaveServerGroupName": "Group1",
        "MasterSlaveBackendServers": [
          {
            "ServerId": "vm****",
            "Port": "80",
            "Weight": "100",
            "ServerType": "Master"
          },
          {
            "ServerId": "vm****",
            "Port": "90",
            "Weight": "100",
            "ServerType": "Slave"
          }
        ],
        "LoadBalancerId": "lb-bp1hv944r69al4j9j****"
      }
    }
  },
  "Outputs": {
    "MasterSlaveServerGroupId": {
      "Value": {
        "Fn::GetAtt": [
          "MasterSlaveServerGroup",
          "MasterSlaveServerGroupId"
        ]
      }
    }
  }
}
```

5.1.6.7.10. ALIYUN::SLB::Rule

ALIYUN::SLB::Rule is used to add forwarding rules for a specified HTTP or HTTPS listener.

Statement

```
{
  "Type": "ALIYUN::SLB::Rule",
  "Properties": {
    "ListenerPort": Integer,
    "RuleList": List,
    "LoadBalancerId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ListenerPort	Integer	Yes	No	The frontend listener port used by the SLB instance.	Valid values: 1 to 65,535.
RuleList	List	Yes	No	The list of forwarding rules to be added.	A maximum of 10 forwarding rules can be added at a time. Each forwarding rule contains the following parameters: RuleName, Domain, Url, and VServerGroupId. You must specify at least one of the following parameters: Domain and URL. The combination of Domain and URL must be unique in a listener.
LoadBalancerId	String	No	No	The IDs of SLB instances.	None

RuleList syntax

```
"RuleList": [
  {
    "Url": String,
    "Domain": String,
    "VServerGroupId": String,
    "RuleName": String
  }
]
```

RuleList properties

Parameter	Type	Required	Editable	Description	Constraint

Parameter	Type	Required	Editable	Description	Constraint
Url	String	Yes	Released	The request URL.	The name must be 1 to 80 characters in length and can contain letters, numbers, and special characters. `-/. percent signs (%), question marks (?), #&` .
Domain	String	Yes	Released	The request domain name associated with the forwarding rule.	None
VServerGroupId	String	No	No	The ID of the destination VServer group specified in the forwarding rule.	None
RuleName	String	No	No	The name of the forwarding rule.	The name must be 1 to 40 characters in length and can contain letters, numbers, and special characters. `-/. _` . Forwarding rule names must be unique within each listener.

Response parameters

Fn::GetAtt

Rules: the list of forwarding rules.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Rule": {
      "Type": "ALIYUN::SLB::Rule",
      "Properties": {
        "ListenerPort": {
          "Ref": "ListenerPort"
        },
        "RuleList": {
          "Fn::Split": [",", {
            "Ref": "RuleList"
          }, {
            "Ref": "RuleList"
          }]
        },
        "LoadBalancerId": {
          "Ref": "LoadBalancerId"
        }
      }
    }
  },
  "Parameters": {
    "ListenerPort": {
      "Type": "Number",
      "Description": "The front-end HTTPS listener port of the Server Load Balancer instance. Valid va
lue:\n1-65535",
      "MaxValue": 65535,
      "MinValue": 1
    },
    "RuleList": {
      "MinLength": 1,
      "Type": "CommaDelimitedList",
      "Description": "The forwarding rules to add.",
      "MaxLength": 10
    },
    "LoadBalancerId": {
      "Type": "String",
      "Description": "The ID of Server Load Balancer instance."
    }
  },
  "Outputs": {
    "Rules": {
      "Description": "A list of forwarding rules. Each element of rules contains \"RuleId\".",
      "Value": {
        "Fn::GetAtt": ["Rule", "Rules"]
      }
    }
  }
}
```

5.1.6.7.11. ALIYUN::SLB::VServerGroup

ALIYUN::SLB::VServerGroup is used to create a VServer group and adds backend servers to the SLB instance.

Syntax

```
{
    "Type" : "ALIYUN::SLB::VServerGroup",
    "Properties" : {
        "VServerGroupName" : String,
        "BackendServers" : List,
        "LoadBalancerId" : String
    }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
VServerGroupName	String	Yes	No	The name of the VServer group.	None
BackendServers	List	Yes	Yes	The list of ECS instances to be added.	A list can contain up to 20 instances.
LoadBalancerId	String	Yes	No	The ID of the SLB instance.	None

BackendServers syntax

```
"BackendServers" : [
    {
        "ServerId" : String,
        "Port" : Integer,
        "Weight" : Integer
    }
]
```

BackendServers properties

Property	Type	Required	Editable	Description	Constraint
ServerId	String	Yes	Yes	The ID of the ECS instance.	None
Port	Integer	Yes	Yes	The backend port used by the SLB instance.	Valid values: 1 to 65535.
Weight	Integer	Yes	Yes	The weight of the ECS instance to be attached to the SLB instance.	Valid values: 0 to 100.

Response parameters

Fn::GetAtt

- VServerGroupId: the ID of the VServer group.
- BackendServers: the list of backend servers added to the SLB instance

Examples

```
{
    "ROSTemplateFormatVersion": "2015-09-01",
    "Resources": {
        "CreateVServerGroup": {
            "Type": "ALIYUN::SLB::VServerGroup",
            "Properties": {
                "LoadBalancerId": "lb-2zenh4ndwrqg14yt0****",
                "VServerGroupName": "VServerGroup-****",
                "BackendServers": [
                    {
                        "ServerId": "i-25zsk****",
                        "Weight": 20,
                        "Port": 8080
                    },
                    {
                        "ServerId": "i-25zsk****",
                        "Weight": 100,
                        "Port": 8081
                    }
                ]
            }
        }
    },
    "Outputs": {
        "VServerGroupId": {
            "Value" : {"Fn::GetAttr": ["CreateVServerGroup",  "VServerGroupId"]
         }
      }
   }
}
```

5.1.6.8. SLS

5.1.6.8.1. ALIYUN::SLS::Index

ALIYUN::SLS::Index is used to create an index for a specified Logstore.

Syntax

```
{
  "Type": "ALIYUN::SLS::Index",
  "Properties": {
    "ProjectName": String,
    "FullTextIndex": Map,
    "LogstoreName": String,
    "KeyIndices": List,
    "LogReduce": Boolean
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ProjectName	String	Yes	No	The name of the Log Service project.	The name must be 3 to 36 characters in length and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start with a lowercase letter or digit.
FullTextIndex	Map	Yes	Yes	The full-text index configurations.	For more information, see FullTextIndex properties.
LogstoreName	String	Yes	No	The name of the Logstore.	None
KeyIndices	List	No	Yes	The field index configurations.	You must specify at least one of the FullTextIndex and KeyIndices parameters. For more information, see Properties.
LogReduce	Boolean	No	Yes	Specifies whether to enable LogReduce.	Default value: false. Valid values: • true • false

FullTextIndex syntax

```
"FullTextIndex": {
  "CaseSensitive": Boolean,
  "Delimiter": String,
  "IncludeChinese": Boolean,
  "Enable": Boolean
}
```

FullTextIndex properties

Property	Type	Required	Editable	Description	Constraint

Property	Type	Required	Editable	Description	Constraint
Enable	Boolean	Yes	Yes	Specifies whether to enable full-text indexing.	Default value: true. Valid values: • true • false
CaseSensitive	Boolean	No	Yes	Specifies whether the field is case-sensitive.	Default value: false. Valid values: • true • false
Delimiter	String	No	Yes	The delimiter that is used to separate keywords.	Valid values: `,'";=()[]{}? @&<>/:\n\t\r`
IncludeChinese	Boolean	No	Yes	Specifies whether to support Chinese word segmentation.	Default value: false. Valid values: • true • false

KeyIndices syntax

```
"KeyIndices": [
  {
    "Name": String,
    "EnableAnalytics": Boolean,
    "Delimiter": String,
    "CaseSensitive": Boolean,
    "JsonKeyIndices": List,
    "Alias": String,
    "IncludeChinese": String,
    "Type": String
  }
]
```

KeyIndices properties

Property	Type	Required	Editable	Description	Constraint
Name	String	Yes	Yes	The name of the field.	You can use a nested name that is separated with periods (.). Example: k1.k2.k3.

Property	Type	Required	Editable	Description	Constraint
EnableAnalytics	Boolean	No	Yes	Specifies whether to enable statistical analysis on the field.	Default value: true. Valid values: • true • false
Delimiter	String	No	Yes	The delimiter that is used to separate keywords.	Valid values: `,'";=()[]{}? @&<>/:\n\t\r`
CaseSensitive	Boolean	No	Yes	Specifies whether the field is case-sensitive.	Default value: false. Valid values: • true • false This parameter takes effect only when the Type parameter is set to text or json.
JsonKeyIndices	List	No	Yes	The JSON index configurations. Format: `[{"key1": "value1", "key2": "value2", ...}]`.	Supported keys are Name, Alias, Type, and EnableAnalytics. For more information, see JsonKeyIndices properties.
Alias	String	No	Yes	The alias of the field.	None
IncludeChinese	Boolean	No	Yes	Specifies whether to support Chinese word segmentation.	Default value: false. Valid values: • true • false This parameter takes effect only when the Type parameter is set to text.

Property	Type	Required	Editable	Description	Constraint
Type	String	Yes	Yes	The type of the field.	Default value: text. Valid values: • text • long • double • json

JsonKeyIndices syntax

```
"JsonKeyIndices": [
  {
    "Type": String,
    "Alias": String,
    "EnableAnalytics": Boolean,
    "Name": String
  }
]
```

JsonKeyIndices properties

Property	Type	Required	Editable	Description	Constraint
Name	String	Yes	Yes	The name of the field.	None
EnableAnalytics	Boolean	No	Yes	Specifies whether to enable statistical analysis on the field.	Valid values: • true • false
Alias	String	No	Yes	The alias of the field.	None
Type	String	Yes	Yes	The type of the field.	None

Response parameters

Fn::GetAtt

None

Examples

`JSON` format

```
{

    - true
    - false
```

5.1.6.8.2. ALIYUN::SLS::Logstore

ALIYUN::SLS::Logstore is used to create a Logstore in a Log Service project.

Syntax

```
{
  "Type": "ALIYUN::SLS::Logstore",
  "Properties": {
    "ProjectName": String,
    "ShardCount": Integer,
    "AutoSplit": Boolean,
    "MaxSplitShard": Integer,
    "LogstoreName": String,
    "AppendMeta": Boolean,
    "TTL": Integer,
    "EnableTracking": Boolean,
    "PreserveStorage": Boolean
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ProjectName	String	Yes	No	The name of the Log Service project.	• The name must be 3 to 36 characters in length. • It can contain lowercase letters, digits, hyphens (-), and underscores (_). • It must start and end with a lowercase letter or digit.
ShardCount	Integer	No	Yes	The number of shards.	Valid values: 1 to 100. Default value: 2.
MaxSplitShard	Integer	No	Yes	The maximum number of shards during automatic splitting.	Valid values: 1 to 64. This parameter is required when the AutoSplit parameter is set to true.

Property	Type	Required	Editable	Description	Constraint
LogstoreName	String	Yes	No	The name of the Logstore.	The name must be unique in a project. • The name must be 3 to 36 characters in length. • It can contain lowercase letters, digits, hyphens (-), and underscores (_). • It must start and end with a lowercase letter or digit.
AutoSplit	Boolean	No	Yes	Specifies whether to automatically split shards.	Valid values: • true • false Default value: false.
TTL	Integer	No	Yes	The data retention period.	Valid values: 1 to 3600. Default value: 30. Unit: days.
EnableTracking	Boolean	No	Yes	Specifies whether to enable WebTracking.	WebTracking can collect access information about web browsers, iOS applications, and Android applications. Valid values: • true • false Default value: false.

Property	Type	Required	Editable	Description	Constraint
PreserveStorage	Boolean	No	Yes	Specifies whether to permanently preserve logs.	Valid values: • true • false Default value: false. If this parameter is set to true, the TTL parameter does not take effect.
AppendMeta	Boolean	No	Yes	Specifies whether to add the public IP address of the client and the log arrival time after the log is received.	Valid values: • true • false Default value: false.

Response parameters

Fn::GetAtt

LogstoreName: the name of the Logstore.

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Logstore": {
      "Type": "ALIYUN::SLS::Logstore",
      "Properties": {

```

5.1.6.8.3. ALIYUN::SLS::LogtailConfig

ALIYUN::SLS::LogtailConfig is used to configure Logtail parameters for data collection.

Syntax

```
{
  "Type": "ALIYUN::SLS::LogtailConfig",
  "Properties": {
    "ProjectName": String,
    "LogtailConfigName": String,
    "LogstoreName": String,
    "RawConfigData": Map,
    "CloneFrom": Map
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
ProjectName	String	Yes	No	The name of the Log Service project.	None
LogtailConfigName	String	Yes	No	The name of the Logtail configuration file.	The configuration file name must be unique in a project. The name must be 2 to 128 characters in length and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start and end with a lowercase letter or digit.
LogstoreName	String	Yes	No	The name of the Logstore.	None

Property	Type	Required	Editable	Description	Constraint
RawConfigData	Map	No	Yes	The raw configuration data.	The format is the same as that of the response from the GetConfig operation of Log Service. If CloneFrom and RawConfigData are both specified, the data of LogtailConfig and RawConfigData is merged. In this case, configName, outputType, and outputDetail of RawConfigData are ignored. Sample value: <code>{"configName": "test-logtail-config", "createTime": 1574843554, "inputDetail": {"acceptNoEnoughKeys": false, "adjustTimezone": false, "advanced": { "force_multiconfig": false }, "autoExtend": true, "delayAlarmBytes": 0, "delaySkipBytes": 0, "discardNonUtf8": false, "discardUnmatch": false, "dockerExcludeEnv": {}, "dockerExcludeLabel": {}, "dockerFile": false, "dockerIncludeEnv": {}, "dockerIncludeLabel": {}, "enableRawLog": false, "enableTag": false, "fileEncoding": "utf8", "filePattern": "test.log*", "filterKey": [], "filterRegex": [], "key": ["time", "logger", "level", "request_id", "user_id", "region_id", "content"], "localStorage": true,</code>

Property	Type	Required	Editable	Description	Constraint
					"logPath": "/var/log/test", "logTimezone": "", "logType": "delimiter_log", "maxDepth": 100, "maxSendRate": -1, "mergeType": "topic", "preserve": true, "preserveDepth": 1, "priority": 0, "quote": "\u0001", "sendRateExpire": 0, "sensitive_keys": [], "separator": ",,,", "shardHashKey": [], "tailExisted": false, "timeFormat": "", "timeKey": "", "topicFormat": "none" }, "inputType": "file", "lastModifyTime": 1574843554, "logSample": "2019-11-27 10:48:23,160,,,MAIN,,,INFO,,,98DCC51D-BE5D-49C7-B3FD-37B2BAEFB296,,,123456789,,,cn-hangzhou,,,this is a simple test.", "outputDetail": { "endpoint": "cn-hangzhou-intranet.log.aliyuncs.com", "logstoreName": "test-logstore", "region": "cn-hangzhou"}, "outputType": "LogService"} .
CloneFrom	Map	No	Yes	The configurations for cloning LogtailConfig data of another Log Service project.	You must specify one of the CloneFrom and LogtailConfig parameters. For more information, see CloneFrom properties.

CloneFrom syntax

```
"CloneFrom": {
  "ProjectName": String,
  "LogtailConfigName": String
}
```

CloneFrom properties

Property	Type	Required	Editable	Description	Constraint
ProjectName	String	Yes	Yes	The name of the Log Service project.	None
LogtailConfigName	String	Yes	Yes	The name of the Logtail configuration file.	None

Response parameters

Fn::GetAtt

- Endpoint: the endpoint.
- AppliedMachineGroups: a list of machines configured for log collection.
- LogtailConfigName: the name of the Logtail configuration file.

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",

To view more examples, visit SLS.json and SLS.yml. In the examples, the ALIYUN::SLS::Project, ALIYUN::SLS::Logstore, ALIYUN::SLS::Index, ALIYUN::SLS::LogtailConfig, ALIYUN::SLS::MachineGroup, ALIYUN::SLS::ApplyConfigToMachineGroup, ALIYUN::ApiGateway::LogConfig, ALIYUN::SLS::Savedsearch, and ALIYUN::SLS::Alert resource types are involved.

5.1.6.8.4. ALIYUN::SLS::Savedsearch

ALIYUN::SLS::Savedsearch is used to save search results as a saved search.

Syntax

```
{
  "Type": "ALIYUN::SLS::Savedsearch",
  "Properties": {
    "Project": String,
    "Detail": Map
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
Project	String	Yes	No	The name of the Log Service project.	None
Detail	Map	Yes	Yes	The details of the query.	For more information, see Detail properties.

Detail syntax

```
"Detail": {
  "SearchQuery": String,
  "Logstore": String,
  "DisplayName": String,
  "SavedsearchName": String,
  "Topic": String
}
```

Detail properties

Property	Type	Required	Editable	Description	Constraint
SearchQuery	String	Yes	Yes	The query statement.	None
Logstore	String	Yes	Yes	The Logstore in which the query is performed.	None
DisplayName	String	No	Yes	The display name that you specify for the saved search.	The name must be 1 to 63 characters in length.
SavedsearchName	String	Yes	No	The name of the saved search, which is generated by the system in the project.	None
Topic	String	Yes	Yes	The log topic that is used to classify logs.	None

Response parameters

Fn::GetAtt

SavedsearchName: the name of the saved search.

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Project": {
      "Type": "String",
      "Description": "Project name"
    },
    "Detail": {
      "Type": "Json",
      "Description": ""
    }
  },
  "Resources": {

      "Type": "ALIYUN::SLS::Savedsearch",
      "Properties": {
        "Project": {
          "Ref": "Project"
        },
        "Detail": {
          "Ref": "Detail"
        }
      }
    }
  },
  "Outputs": {
    "SavedsearchName": {
      "Description": "Savedsearch name.",
      "Value": {
        "Fn::GetAtt": [
          "SavedSearch",
          "SavedsearchName"
        ]
      }
    }
  }
}
```

`YAML` format

```
ROSTemplateFormatVersion: '2015-09-01'
Parameters:
  Project:
    Type: String
    Description: Project name
  Detail:
    Type: Json
    Description: ''
Resources:
  SavedSearch:
    Type: 'ALIYUN::SLS::Savedsearch'
    Properties:
      Project:
        Ref: Project
      Detail:
        Ref: Detail
Outputs:
  SavedsearchName:
    Description: Savedsearch name.
    Value:
      'Fn::GetAtt':
        - SavedSearch
        - SavedsearchName
```

5.1.6.8.5. ALIYUN::SLS::Project

ALIYUN::SLS::Project is used to create a Log Service project.

Syntax

```
{
  "Type": "ALIYUN::SLS::Project",
  "Properties": {
    "Name": String,
    "Description": String,
    "Tags": List
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
Name	String	Yes	No	The name of the project.	The name must be 3 to 36 characters in length and can contain lowercase letters, digits, and hyphens (-). It must start and end with a lowercase letter or digit.
Description	String	No	No	The description of the project.	The description can be up to 64 characters in length and cannot contain the following special characters: `< > ' \ "`.

Property	Type	Required	Editable	Description	Constraint
Tags	List	No	No	The list of one or more tags of the project.	A maximum of 20 tags can be specified. For more information, see Tags properties.

Tags syntax

```
"Tags": [
  {
    "Key": String,
    "Value": String
  }
]
```

Tags properties

Property	Type	Required	Editable	Description	Constraint
Key	String	Yes	No	The key of the tag.	The tag key must be 1 to 128 characters in length and cannot contain `http://` or `https://`. It cannot start with `acs:` or `aliyun`.
Value	String	No	No	The value of the tag.	The tag value must be 0 to 128 characters in length and cannot contain `http://` or `https://`. It cannot start with `acs:` or `aliyun`.

Response parameters

Fn::GetAtt

Name: The name of the Log Service project.

Examples

`JSON` format

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Parameters": {
    "Description": {
      "Type": "String",
      "Description": "Project description: <>'\"\\ is not supported, up to 64 characters.",
      "MaxLength": 64
    },
    "Tags": {
      "Type": "Json",
      "Description": "Tags to attach to project. Max support 20 tags to add during create project. Each tag with two properties Key and Value, and Key is required.",
      "MaxLength": 20
    },
    "Name": {
      "Type": "String",
      "Description": "Project name:\n1. Only supports lowercase letters, numbers, hyphens (-) and underscores (_).\n2. Must start and end with lowercase letters and numbers.\n3. The name length is 3-63 characters.",
      "AllowedPattern": "^[a-zA-Z0-9_-]+$",

      'Fn::GetAtt':
        - Project
        - Name
```

To view more examples, visit SLS.json and SLS.yml. The following resource types are involved in these examples:

- ALIYUN::SLS::Project
- ALIYUN::SLS::Logstore
- ALIYUN::SLS::Index
- ALIYUN::SLS::LogtailConfig
- ALIYUN::SLS::MachineGroup
- ALIYUN::SLS::ApplyConfigToMachineGroup
- ALIYUN::ApiGateway::LogConfig
- ALIYUN::SLS::Savedsearch
- ALIYUN::SLS::Alert

5.1.6.9. VPC

5.1.6.9.1. ALIYUN::VPC::EIP

ALIYUN::VPC::EIP is used to apply for an Elastic IP address.

Statement

```
{
  "Type": "ALIYUN::VPC::EIP",
  "Properties": {
    "Isp": String,
    "Period": Number,
    "ResourceGroupId": String,
    "AutoPay": Boolean,
    "InstanceChargeType": String,
    "PricingCycle": String,
    "InternetChargeType": String,
    "Bandwidth": Number
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
ResourceGroupId	String	Yes	Released	The ID of the resource group to which the RDS instance belongs.	None
Bandwidth	Number	Erased	Released	The network bandwidth. Unit: Mbit/s.	If this parameter is not specified, the default value 5Mbps is used.
InternetChargeType	String	Yes	Released	The billing method for network usage. Default value: PayByBandwidth.	Valid values: • PayByBandwidth: pay-by-bandwidth. • PayByTraffic Default value: PayByBandwidth.
InstanceChargeType	String	Yes	Released	The billing method of the Elastic IP address. Default value: Postpaid.	Valid values: • Prepaid • Postpaid: pay-as-you-go Default value: PostPaid.

Parameter	Type	Required	Editable	Description	Constraint
PricingCycle	String	Yes	Released	The billing cycle of the subscription. Default value: Month.	Valid values: • Month: paid by month. • Year Default value: Month. **Note** This parameter is required when InstanceChargeType is set to Prepaid.
Period	Number	Erased	Released	The subscription period.	Valid values: • If pay by month is selected, the billing method can be a fee of 1 to 9. • If pay-as-you-go is selected, the payment can be in the range of 1 to 3. Default value: 1 **Note** This parameter is required when InstanceChargeType is set to Prepaid.
AutoPay	Boolean	Erased	Released	Specifies whether to enable automatic payment.	Valid values: • false: Automatic payment is disabled. After an order is generated, you must go to the Order Center to make the payment. • true: Automatic payment is enabled. Payments are automatically made. **Note** This parameter is required when InstanceChargeType is set to Prepaid.
Isp	String	Yes	Released	The ISP tag used for Finance Cloud. This parameter takes effect only when your region is set to China (Hangzhou).	This parameter is ignored if you are not a Finance Cloud user.

Response parameters

Fn::GetAtt

- EipAddress: the allocated Elastic IP address.
- AllocationId: the ID of the instance that the Elastic IP address is allocated to.
- OrderId: The order ID that is returned when you set the InstanceChargeType parameter to Prepaid.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "Eip": {
      "Type": "ALIYUN::VPC::EIP",
      "Properties": {
        "InternetChargeType": "PayByTraffic",
          "Bandwidth": 200
      }
    }
  },
  "Outputs": {
    "EipAddress": {
      "Value" : {"Fn::GetAtt": ["Eip", "EipAddress"]}
    },
    "AllocationId": {
      "Value" : {"Fn::GetAtt": ["Eip", "AllocationId"]}
    },
    "OrderId": {
      "Value" : {"Fn::GetAtt": ["Eip", "OrderId"]}
    }
  }
}
```

5.1.6.9.2. ALIYUN::VPC::EIPAssociation

ALIYUN::VPC::EIPAssociation is used to associate an Elastic IP address with a cloud service instance.

Statement

```
{
  "Type": "ALIYUN::VPC::EIPAssociation",
  "Properties": {
    "AllocationId": String,
    "InstanceId": String,
    "PrivateIpAddress": String,
    "Mode": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
AllocationId	String	No	Yes	The ID of the Elastic IP address.	None

Parameter	Type	Required	Editable	Description	Constraint
InstanceId	String	No	Yes	The ID of the cloud service instance.	The following instance types are supported: • VPC-connected ECS instances • VPC-connected SLB instances • NAT gateways • HAVIP • Elastic network interfaces
PrivateIpAddress	String	Yes	True	The private IP address in the CIDR block of the VSwitch.	None
Mode	String	Yes	True	The association mode.	Valid values: • NAT • MULTI_BINDED

Response parameters

Fn::GetAtt

- EipAddress: The allocated Elastic IP address.
- AllocationId: The ID of the instance to which the Elastic IP address is allocated.

Examples

`JSON` format

5.1.6.9.3. ALIYUN::VPC::PeeringRouterInterfaceBinding

ALIYUN::VPC::PeeringRouterInterfaceBinding is used to associate two router interfaces to be interconnected.

Statement

```
{
  "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
  "Properties": {
    "OppositeRouterId": String,
    "OppositeInterfaceId": String,
    "OppositeInterfaceOwnerId": String,
    "RouterInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
RouterInterfaceId	String	No	No	The ID of the router interface.	None
OppositeInterfaceId	String	No	No	The ID of the peer router interface.	None

Parameter	Type	Required	Editable	Description	Constraint
OppositeRouterId	String	Yes	Released	The ID of the router to which the peer router interface belongs.	None
OppositeInterfaceOwnerId	String	Yes	Released	The ID of the owner of the peer router interface.	None

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the vRouter.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "InitiatorRouterInterfaceBinding": {
      "Type": "ALIYUN::VPC::PeeringRouterInterfaceBinding",
      "Properties": {
        "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
        "OppositeInterfaceId": "ri-2zex1tkyym98pjaor****",
        "OppositeRouterId": "vrt-2zexb35tzoriu0286****"
      }
    }
  }
}
```

5.1.6.9.4. ALIYUN::VPC::PeeringRouterInterfaceConnection

ALIYUN::VPC::PeeringRouterInterfaceConnection is used to initiate a router interface connection.

Statement

```
{
  "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
  "Properties": {
    "OppositeInterfaceId": String,
    "RouterInterfaceId": String
  }
}
```

Properties

Parameter	Type	Required	Editable	Description	Constraint
OppositeInterfaceId	String	No	No	The ID of the acceptor router interface.	None

Parameter	Type	Required	Editable	Description	Constraint
RouterInterfaceId	String	No	No	The ID of the router interface to initiate the connection.	None

Response parameters

Fn::GetAtt

- OppositeInterfaceId: the ID of the acceptor router interface.
- RouterInterfaceId: the ID of the router interface that initiates the connection.

Sample request

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "InitiatorRouterInterfaceBinding": {
      "Type": "ALIYUN::VPC::PeeringRouterInterfaceConnection",
      "Properties": {
        "RouterInterfaceId": "ri-2zedgo0ih64g1me29****",
        "OppositeInterfaceId": "ri-2ze4k5n2aeardu8cy****"
      }
    }
  }
}
```

5.1.6.9.5. ALIYUN::VPC::RouterInterface

ALIYUN::VPC::RouterInterface is used to create a router interface.

Syntax

```
{
  "Type": "ALIYUN::VPC::RouterInterface",
  "Properties": {
    "OppositeRegionId": String,
    "Description": String,
    "HealthCheckSourceIp": String,
    "RouterType": String,
    "AccessPointId": String,
    "RouterId": String,
    "Role": String,
    "OppositeInterfaceOwnerId": String,
    "OppositeAccessPointId": String,
    "HealthCheckTargetIp": String,
    "OppositeRouterId": String,
    "Spec": String,
    "OppositeRouterType": String,
    "Name": String,
    "PricingCycle": String,
    "Period": Number,
    "AutoPay": Boolean,
    "InstanceChargeType": String
  }
}
```

Properties

Property	Type	Required	Editable	Description	Constraint
RouterId	String	Yes	No	The ID of the router	None
Role	String	Yes	No	The role of the router interface.	• When RouterType is set to VBR, set the value to InitiatingSide. • When OppositeRouterType is set to VBR, set the value to AcceptingSide.
RouterType	String	No	No	The type of the router to which the router interface belongs.	Valid values: • VRouter • VBR
AccessPointId	String	No	No	The ID of the access point of the router interface.	• This parameter is required when RouterType is set to VBR. The access point ID cannot be modified after the router interface is created. • This parameter is not required when RouterType is set to VRouter.

Property	Type	Required	Editable	Description	Constraint
Spec	String	No	No	The specifications of the router interface.	The following list includes available specifications and the corresponding bandwidth values: • Mini.2: 2 Mbit/s • Mini.5: 5 Mbit/s • Small.1: 10 Mbit/s • Small.2: 20 Mbit/s • Small.5: 50 Mbit/s • Middle.1: 100 Mbit/s • Middle.2: 200 Mbit/s • Middle.5: 500 Mbit/s • Large.1: 1,000 Mbit/s • Large.2: 2,000 Mbit/s • Large.5: 5,000 Mbit/s • Xlarge.1: 10,000 Mbit/s Note • This parameter is required when Role is set to InitiatingSide. • The value Negative is used by default when Role is set to Accepting Side.
OppositeRegionId	String	No	No	The region ID of the peer router interface.	None
OppositeInterfaceOwnerId	String	No	No	The ID of the owner of the peer router interface.	The default value is the ID of the current user.
OppositeRouterId	String	No	No	The ID of the router to which the peer router interface belongs.	None

Property	Type	Required	Editable	Description	Constraint
OppositeRouterType	String	No	No	The type of the router to which the peer router interface belongs.	Valid values: • When RouterType is set to VBR, set the value to VRouter. • VBR
OppositeAccessPointId	String	No	No	The ID of the access point of the peer router interface.	• When OppositeRouterType is set to VBR, this parameter is required . The access point ID cannot be modified after the router interface is created. • When OppositeRouterType is set to VRouter, this parameter is not required. • When OppositeRouterType is set to VBR, the VBR specified by the OppositeRouterId parameter must be in the access point specified by the OppositeAccessPointId parameter.
Description	String	No	No	The description of the router interface.	The description must be 2 to 256 characters in length. It cannot start with `http://` or `https://` . The parameter is empty by default.
Name	String	No	No	The display name of the router interface.	• The name must be 2 to 128 characters in length and can contain letters, digits, periods(.), underscores (_), and hyphens (-). • It must start with a letter but cannot start with `http://` or `https://` .

Property	Type	Required	Editable	Description	Constraint
HealthCheckSourceIp	String	No	No	The source IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	This parameter is valid only for VRouter interfaces with a peer router interface on a VBR. It must be an unused IP address in the VPC where the local VRouter is located. The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.
HealthCheckTargetIp	String	No	No	The destination IP address of health check packets used in leased line disaster recovery and ECMP scenarios.	This parameter is valid only for VRouter interfaces with a peer router interface on a VBR. Typically, you can use the IP address of a customer premises equipment (CPE) on the user side of the leased line, which is the IP address of the peer gateway on the VBR where the peer router interface is located. You can also specify another IP address on the user side of the leased line as the destination IP address. The HealthCheckSourceIp and HealthCheckTargetIp parameters must either both be specified or both left unspecified.

Property	Type	Required	Editable	Description	Constraint
PricingCycle	String	No	No	The billing cycle of the subscription.	Valid values: • Month • Year
Period	Number	No	No	The subscription duration.	• Valid values when the PricingCycle parameter is set to Month: 1 to 9. • Valid values when the PricingCycle parameter is set to Year: 1 to 3.
AutoPay	Boolean	No	No	Specifies whether to enable automatic payment.	Default value: false. Valid values: • true • false
InstanceChargeType	String	No	No	The billing method of the instance.	Valid values: • Postpaid: pay-as-you-go • Prepaid: subscription

Response parameters

Fn::GetAtt

RouterInterfaceId: the ID of the router interface.

Examples

```
{
  "ROSTemplateFormatVersion": "2015-09-01",
  "Resources": {
    "RouterInterface": {
      "Type": "ALIYUN::VPC::RouterInterface",
      "Properties": {
        "Name": "RouterInterface_1",
        "Description": "VPC initiator RouterInterface",
        "RouterId": "vrt-2ze2i147e5n0bicoe****",
        "Role": "AcceptingSide",
        "OppositeRegionId": "cn-beijing",
        "HealthCheckSourceIp": "10.0.XX.XX",
        "HealthCheckTargetIp": "192.168.XX.XX"
      }
    }
  },
  "Outputs": {
    "RouterInterfaceId": {
      "Value": {"Fn::GetAtt": ["RouterInterface", "RouterInterfaceId"]}
    }
  }
}
```

6.Object Storage Service (OSS)

6.1. User Guide

6.1.1. What is OSS?

Object Storage Service (OSS) is a secure, cost-effective, and highly reliable cloud storage service provided by Alibaba Cloud.

Compared with user-created server storage, OSS has outstanding advantages in reliability, security, cost-effectiveness, and data processing capabilities. OSS enables you to store and retrieve a variety of unstructured data objects, such as text, images, audios, and videos over networks anytime.

OSS is an object storage service based on key-value pairs. Files uploaded to OSS are stored as objects in buckets. You can obtain the content of an object based on the object key.

In OSS, you can perform the following operations:

- Create a bucket and upload objects to the bucket.
- Obtain an object URL from OSS to share or download the object.
- Modify the attributes or metadata of a bucket or an object. You can also configure the access control list (ACL) of the bucket or the object.
- Perform basic and advanced operations in the OSS console.
- Perform basic and advanced operations by using OSS SDKs or calling RESTful API operations in your application.

6.1.2. Usage notes

Before you use OSS, you must understand the following content:

To allow other users to use all or part of OSS features, you must create RAM users and grant permissions to the users by configuring RAM policies.

Before you use OSS, you must also understand the following limits.

Item	Limit
Bucket	• You can create up to 100 buckets. • After a bucket is created, its name and region cannot be modified.
Upload objects	• Objects larger than 5 GB cannot be uploaded by using the following modes: console upload, simple upload, form upload, or append upload. To upload an object that is larger than 5 GB, you must use multipart upload. The size of an object uploaded by using multipart upload cannot exceed 48.8 TB. • If you upload an object that has the same name of an existing object in OSS, the new object will overwrite the existing object.
Delete objects	• Deleted objects cannot be recovered. • You can delete up to 100 objects at a time in the OSS console. To delete more than 100 objects at a time, you must call an API operation or use an SDK.
Lifecycle	You can configure up to 1,000 lifecycle rules for each bucket.

6.1.3. Quick start

6.1.3.1. Log on to the OSS console

This topic describes how to log on to the Object Storage Service (OSS) console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

5. In the top navigation pane, choose **Products > Object Storage Service**.

6.1.3.2. Create buckets

Objects uploaded to OSS are stored in a bucket. You must create a bucket before you upload objects to OSS.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click **Create Bucket**.

3. On the **Create OSS Bucket** page, configure parameters.

   The following table describes the parameters that you can configure.

Parameter	Description
Organization	Select an organization from the drop-down list for the bucket.
Resource Set	Select a resource set from the drop-down list for the bucket.
Region	Select a region from the drop-down list for the bucket. **Note** ◦ The region of a bucket cannot be changed after the bucket is created. ◦ If you want to access OSS from your ECS instance through the internal network, select the same region where your ECS instance is deployed.
Cluster	Select a cluster for the bucket.
Bucket Name	Enter the name of the bucket. **Note** ◦ The bucket name must comply with the naming conventions. ◦ The bucket name must be globally unique among all existing buckets in OSS. ◦ The bucket name cannot be changed after the bucket is created.
Storage Class	Set the value to **Standard**. Only Standard is supported.
Bucket Capacity	Specify the capacity of the bucket. Valid values: 0 to 2000000. Unit: TB or GB.
Access Control List (ACL)	Set the ACL of the bucket. You can select the following options: ◦ **Private**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access objects in the bucket without authorization. ◦ **Public Read**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users can only read objects in the bucket. ◦ **Public Read/Write**: All users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are paid by the owner of the bucket. Exercise caution when you configure this option. **Note** You can modify the ACL of a bucket after the bucket is created. For more information, see Modify bucket ACLs.

Parameter	Description
Server-Side Encryption	Configure server-side encryption for the bucket. You can select the following options: ○ **None**: Server-side encryption is not performed. ○ **AES256**: AES256 is used to encrypt each object in the bucket using different data keys. Customer master keys (CMKs) used to encrypt the data keys are rotated regularly. ○ **KMS**: CMKs managed by KMS are sued to encrypt objects in the bucket.
Encryption Algorithm	You can configure this parameter when you select **KMS** for **Server-Side Encryption**.
Key ID	You can configure this parameter when you select **KMS** for **Server-Side encryption**. OSS uses the specified CMK to encrypt objects in the bucket. **Note** To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.

4. Click **Submit**.

6.1.3.3. Upload objects

After you create a bucket, you can upload objects to it.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

You can upload an object of any format to a bucket. You can use the OSS console to upload an object up to 5 GB in size. To upload an object larger than 5 GB, use OSS SDKs or call an API operation.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. On the bucket details page that appears, click **Files**.
4. Click **Upload**.
5. In the **Upload** panel, set the parameters described in the following table.

Parameter	Description
Upload To	Set the directory to which you want to upload objects. ○ **Current**: Objects are uploaded to the current directory. ○ **Specified**: Objects are uploaded to the specified directory. You must enter the directory name. If the specified directory does not exist, OSS automatically creates the specified directory and uploads the object to the directory.

Parameter	Description
File ACL	Set the access control list (ACL) of the object to upload. Default value: **Inherited from Bucket**. ○ **Inherited from Bucket**: The ACL of uploaded objects is the same as that of the bucket. ○ **Private**: Only the owner or authorized users can read and write objects in the bucket. Other users, which includes anonymous users, cannot access the objects in the bucket without authorization. ○ **Public Read**: Only the bucket owner can perform write operations on objects in the bucket. Other users, which includes anonymous users, can perform only read operations on objects in the bucket. ○ **Public Read/Write**: All users, which includes anonymous users, can read and write objects in the bucket.
Upload	Drag one or more files to upload to this section, or click **Upload** to select one or more files to upload. **Notice** ○ When the object to upload has the same name as an existing object in the bucket, the existing object is overwritten. ○ If you upload a directory, only the files in the directory are uploaded, and the files are stored in the same directory in the bucket. ○ The name of an uploaded object must comply with the following conventions: ■ The name must be encoded in UTF-8. ■ The name is case-sensitive. ■ The name must be 1 to 1,023 bytes in length. ■ The name cannot start with a forward slash (/) or backslash (\).

6. In the **Upload Tasks** panel, wait until the upload task is completed.

   During the upload process, you can click **Cancel All** to cancel the task. After the task is completed, click **Removed** to remove the task.

   Notice Do not refresh or close the **Upload Tasks** panel when objects are being uploaded. Otherwise, the upload tasks are interrupted.

6.1.3.4. Obtain object URLs

You can obtain the URL of an uploaded object in Object Storage Service (OSS) and share the URL with other users to preview or download the object.

Prerequisites

An object is uploaded to the bucket. For more information, see Upload objects.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.

3. Click the **Files** tab.
4. Obtain object URLs
   - Obtain the URL of a single object.

     Click the name of the object whose URL you want to obtain, or click **View Details** in the Actions column that corresponds to the object. In the **View Details** panel, click **Copy File URL**.
   - Batch export URL lists

     Select the objects that you want to share. Choose **Batch Operation > Export URL List**.

6.1.4. Buckets

6.1.4.1. View bucket information

You can view the detailed information about created buckets in the Object Storage Service (OSS) console.

Prerequisites

A bucket is created. For more information, see Create buckets.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. On the **Overview** tab, you can view the information about the bucket, which includes Organization and Resource Set, Domain Names, and Basic Settings.

6.1.4.2. Delete buckets

You can delete a bucket in the Object Storage Service (OSS) console.

Prerequisites

All objects and parts in the bucket are deleted. For more information, see Delete objects and Manage parts.

> **Warning** Deleted objects, parts, and buckets cannot be recovered. Exercise caution when you delete objects, parts, and buckets.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. In the upper-right corner, click **Delete Bucket**.
4. In the message that appears, click **OK**.

6.1.4.3. Modify bucket ACLs

Object Storage Service (OSS) provides access control list (ACL) to control access to buckets. By default, the ACL of a bucket is private. You can modify the ACL of a bucket after the bucket is created.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

You can set the ACL of a bucket to one of the following values:

- Private: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users, cannot access the objects in the bucket without authorization.
- Public Read: Only the owner or authorized users of this bucket can write objects in the bucket. Other users, including anonymous users, can only read the objects in the bucket.
- Public Read/Write: Any users, including anonymous users, can read and write the objects in the bucket.

> **Warning** If you set the ACL of a bucket to Public Read or Public Read/Write, other users can read the data in the bucket without authentication, which may result in security risks. To ensure the security of your data, we recommend that you set the ACL of your bucket to private.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. Click the **Basic Settings** tab. Find the **Access Control List (ACL)** section.
4. Click **Configure**. Modify the bucket ACL.
5. Click **Save**.

6.1.4.4. Configure static website hosting

You can configure static website hosting for a bucket in the Object Storage Service (OSS) console so that users can access the website by using the domain name of the bucket.

Prerequisites

A bucket is created. For more information, see Create buckets.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. Click the **Basic Settings** tab. Find the **Static Pages** section.
4. Click **Configure** and then set the parameters described in the following table.

Parameter	Description
Default Homepage	Specify an index page that functions similar to index.html. Only HTML objects can be specified as the index page. If you do not specify this parameter, static website hosting is disabled.
Default 404 Page	Set the default 404 page that is displayed when the requested resource does not exist. Only HTML, JPG, PNG, BMP, or WebP objects in the root directory of the bucket can be set to the default 404 page. If you do not specify this parameter, Default 404 Page is disabled.

5. Click **Save**.

6.1.4.5. Configure hotlink protection

You can configure hotlink protection for a bucket in the Object Storage Service (OSS) console to prevent data in your bucket from being accessed by unauthorized domain names.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

The hotlink protection feature allows you to configure a Referer whitelist for a bucket. This way, only requests from domain names included in the Referer whitelist can access your data in the bucket. OSS allows you to configure Referer whitelists based on the Referer header field in HTTP or HTTPS requests.

After hotlink protection is configured for a bucket, OSS verifies requests to objects in the bucket only when the requests are initiated by using signed URLs or from anonymous users. Requests that contain the Authorization field in the header are not verified.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. Click the **Basic Settings** tab. Find the **Hotlink Protection** section.
4. Click **Configure** and configure the following parameters:
   - Enter domain names or IP addresses in the **Referer Whitelist** field. Separate multiple Referers by using line feed. You can use asterisks (*) and question marks (?) as wildcards. Examples:
     - If you add www.example.com to the Referer whitelist, requests sent from URLs that start with *www.example.com*, such as *www.example.com/123* and *www.example.com.cn* are allowed.
     - If you add *www.example.com/ to the Referer whitelist, requests sent from *http://www.example.com/* and *https://www.example.com/* are allowed.
     - An asterisk (*) can be used as a wildcard to indicate zero or more characters. For example, if you add *.example.com to the Referer whitelist, requests sent from URLs such as *help.example.com* and *www.example.com* are allowed.
     - A question mark (?) can be used as a wildcard to indicate a single character. For example, if you add example?.com to the Referer whitelist, requests sent from URLs such as *examplea.com* and *exampleb.com* are allowed.
     - You can add domain names or IP addresses that include a port number, such as *www.example.com:8080* and *10.10.10.10:8080*, to the Referer whitelist.
   - Select whether to turn on **Allow Empty Referer** to allow requests in which the Referer field is empty.

     An HTTP or HTTPS request with an empty Referer field indicates that the request does not contain the Referer field or the value of the Referer field is empty.

     If you do not allow empty Referers fields, only HTTP or HTTPS requests which include an allowed Referer field can access the objects in the bucket.

   > **Note** By default, if you use the bucket endpoint to preview an MP4 object, the browser sends a request that contains the Referer field and a request that does not contain the Referer field at the same time. Therefore, to allow access to the MP4 objects in your bucket, you must not only add the bucket endpoint to the Referer whitelist but also allow empty Referer fields. To preview a non-MP4 object by using the bucket domain name, you need only to allow empty Referer fields.

5. Click **Save**.

6.1.4.6. Configure logging

When you access Object Storage Service (OSS), a large number of access logs are generated. You can use the logging feature to store OSS access logs in a specified bucket.

Prerequisites

A bucket is created. For more information, see Create buckets.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. Click the **Basic Settings** tab. Find the **Logging** section.
4. Click **Configure**. Turn on the **Logging** switch. Select **Destination Bucket** and set **Log Prefix**.
   - **Destination Bucket**: Select the bucket in which you want to store access logs from the drop-down list. You must be the owner of the selected bucket, and the selected bucket must be in the same region as the bucket for which logging is enabled.
   - **Log Prefix**: Enter the prefix and directory where the access logs are stored. If you specify *log/<TargetPrefix>* as the prefix, access logs are stored in the *log/* directory.
5. Click **Save**.

6.1.4.7. Configure CORS

You can configure cross-origin resource sharing (CORS) in the Object Storage Service (OSS) console to enable cross-origin access.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

OSS provides CORS over HTML5 to implement cross-origin access. When OSS receives a cross-origin request (or an OPTIONS request) for a bucket, OSS reads the CORS rules of the bucket and checks the relevant permissions of the request. OSS matches the request with the rules one by one. When OSS finds the first match, OSS returns a corresponding header in the response. If no match is found, OSS does not include any CORS header in the response.

Procedure

1. Log on to the OSS console.
2. Click Buckets. On the Buckets page that appears, click the name of the bucket to which you want to upload objects.
3. Click the **Basic Settings** tab. In the **Cross-Origin Resource Sharing (CORS)** section, click **Configure**.
4. On the page that appears, click **Create Rule**. Then, in the **Create Rule** panel, configure the parameters in the following table.

Parameter	Required	Description

Parameter	Required	Description
Sources	Yes	Specify the sources from which you want to allow cross-origin requests. Take note of the following items when you configure the sources: ○ You can configure multiple rules for sources. Separate multiple rules with line feeds. ○ The domain names must include the protocol name, such as HTTP or HTTPS. ○ Asterisks (*) are supported as wildcards. Each rule can contain up to one asterisk (*). ○ A domain name must include the port number if the domain name does not use the default port. Example: https://www.example.com:8080. The following examples show how to configure domain names: ○ To match a specified domain name, enter the full domain name. Example: https://www.example.com. ○ Use an asterisk (*) as a wildcard in the domain name to match second-level domains. Example: https://*.example.com. ○ Enter only an asterisk (*) as the wildcard to match all domain names.
Allowed Methods	Yes	Select the cross-origin request methods that are allowed.
Allowed Headers	No	Specify the response headers for the allowed cross-origin requests. Take note of the following rules when you configure the allowed response headers: ○ This parameter is in the key:value format and case-insensitive. Example: content-type:text/plain. ○ You can configure multiple rules for allowed headers. Separate multiple rules with new lines. ○ Each rule can contain up to one asterisk (*) as the wildcard. We recommend that you set this parameter to an asterisk (*) if you do not have special requirements.
Exposed Headers	No	Specify the response headers for allowed access requests from applications, such as an XMLHttpRequest object in JavaScript. Exposed headers cannot include asterisks (*).
Cache Timeout (Seconds)	No	Specify the period of time within which the browser can cache the response for an OPTIONS preflight request to a specific resource. Unit: seconds.

Note You can configure up to 10 CORS rules for each bucket.

5. Click **OK**.

6.1.4.8. Configure lifecycle rules

You can configure a lifecycle rule for a bucket to regularly delete expired objects and parts to save storage costs.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

Take note of the following items when you configure lifecycle rules for a bucket:

- After a lifecycle rule is configured, it is loaded within 24 hours and takes effect within 24 hours after it is loaded. Check the configurations of a rule before you save the rule.
- Objects that are deleted based on lifecycle rules cannot be recovered. Configure lifecycle rules based on your requirements.
- You can configure up to 100 lifecycle rules for each bucket in the Object Storage Service (OSS) console and up to 1,000 lifecycle rules for each bucket by using ossutil.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure lifecycle rules.
3. Click the **Basic Settings** tab. Find the **Lifecycle** section. Click **Configure**.
4. Click **Create Rule**. In the **Create Rule** panel that appears, configure the parameters described in the following table.

Parameter	Description
Status	Specify the status of the lifecycle rule. Valid values: **Enabled** and **Disabled**.
Applied To	Select objects to which the rule applies. You can select **Files with Specified Prefix** or **Whole Bucket**. Files with Specified Prefix indicates that this rule applies to objects whose names contain a specified prefix. Whole Bucket indicates that this rule applies to all objects in the bucket. **Note** If you select **Files with Specified Prefix**, you can configure different lifecycle rules for objects whose names contain different prefixes. If you select **Whole Bucket**, only one lifecycle rule can be configured for the bucket.
Prefix	If you set **Applied To** to **Files with Specified Prefix**, you must specify the prefix of the objects to which the rule applies. For example, if you want that the rule applies to objects whose names start with img, enter *img*.
File Lifecycle	Configure rules for objects to specify when objects expire. You can set File Lifecycle to **Validity Period (Days)**, **Expiration Date**, or **Disabled**. If you select **Disabled**, the configurations of File Lifecycle do not take effect.

Parameter	Description
Delete	Specify when objects expire based on **Validity Period (Days)** or **Expiration Date** that you set for **File Lifecycle**. After objects expire, the objects are deleted. ○ **Validity Period (Days)**: Specify the number of days to retain objects after they are last modified. Select the check box next to Delete and specify a number such as N. The objects expire N days after they are last modified. Then, the objects are deleted the next day after they expire. For example, if you specify the number as 30, objects that are last modified on January 1,2019 are deleted on February 1, 2019. ○ **Expiration Date**: Specify the expiration date. Select the check box next to Delete and set an expiration date. The objects that are last modified before this date expire and are deleted. For example, if you set Expiration Date to January 1, 2019, objects that are last modified before January 1, 2019 are deleted.
Part Lifecycle	Specify the operations to perform on expired parts. You can set Part Lifecycle to **Validity Period (Days)**, **Expiration Date**, or **Disabled**. If you select **Disabled**, the configurations of Part Lifecycle do not take effect. **Notice** You must configure at least one of **File Lifecycle** and **Part Lifecycle**.
Delete Parts	Specify when parts that match the rule expire based on **Validity Period (Days)** or **Expiration Data** that you set for **Part Lifecycle**. Expired parts are deleted. You can configure this parameter in the same way as you configure the Delete parameter in Clear Policy.

5. Click **OK**.

6.1.4.9. Configure storage quota

If the capacity of a bucket reaches the specified storage quota, write operations such as PutObject, MultipartUpload, CopyObject, PostObject, and AppendObject cannot be performed on the bucket. This topic describes how to configure the storage quota of a bucket in Object Storage Service (OSS).

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

Take note of the following items when you configure the storage quota of a bucket:

- Before you configure the storage quota of a bucket, make sure that the quota does not limit your business because write operations cannot be performed if the bucket capacity reaches the specified quota.
- In general, it takes about an hour for OSS to determine whether the bucket capacity exceeds the storage quota. In some cases, it can take longer than one hour.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure storage quota.
3. Click the **Basic Settings** tab and find the **Storage Quota** section.
4. Click **Configure**.
5. On the **Modify OSS Bucket** page, modify the storage quota of the bucket.

- Units: TB or GB.
- Valid values: -1 to 2000000

  The default value is -1, which indicates that the bucket capacity is not limited.

6. Click **Submit**.

   After you submitted, you can click **Back to Console** in the pop-up dialog box to go back to the **Overview** page.

6.1.4.10. Configure cluster-disaster recovery

In cluster-disaster recovery mode, buckets with the same name are replicated. Cluster-based disaster recovery is automatically enabled based on configurations made when the cluster is created. In other words, after a primary bucket is created, a secondary bucket with the same name is automatically created. Information stored in the primary bucket is automatically synchronized to the secondary bucket. By default, Cluster-disaster Recovery is turned on for buckets that are created by using the Object Storage Service (OSS) console.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click Buckets. On the Buckets page, click the name of the bucket to go to the bucket details page.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cluster-disaster Recovery** section.
4. Click **Configure**. Turn on or turn off **Cluster-disaster Recovery**.
5. Click **Save**.

6.1.4.11. Bucket tagging

Object Storage Service (OSS) allows you to configure bucket tagging to classify and manage buckets. For example, you can use this feature to list buckets that have specific tags and configure access control lists (ACLs) for buckets that have specific tags.

Context

The bucket tagging feature uses a key-value pair to identify a bucket. You can add tags to buckets that are used for different purposes and manage the buckets by tags.

- Only the bucket owner or authorized Resource Access Management (RAM) users can configure tagging for the bucket. Otherwise, 403 Forbidden is returned with the AccessDenied error code.
- You can configure up to 20 tags for a bucket.
- The tag key is required. The tag key can be up to 64 Bytes in length and cannot start with `http://`, `https://`, or `Aliyun`.
- The tag value is optional. The tag value can be up to 128 bytes in length. You can leave the parameter empty.
- The key and value of a tag must be encoded in UTF-8.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure tagging.
3. Choose **Basic Settings > Bucket Tagging**.
4. Click **Configure**.

5. Add tags to the bucket based on the naming conventions. You can click the + icon to add multiple tags to a bucket.
6. Click **Save**.

6.1.4.12. Configure server-side encryption

OSS supports server-side encryption. When you upload an object to a bucket for which server-side encryption is enabled, OSS encrypts the object and stores the encrypted object. When you download the encrypted object from OSS, OSS automatically decrypts the object and returns the decrypted object to you. A header is added in the response to indicate that the object is encrypted on the OSS server.

Context

OSS supports the following encryption methods:

- Server-side encryption by using KMS (SSE-KMS)

  OSS uses the default customer master key (CMK) managed by KMS or a specified CMK to encrypt objects. The CMK is managed by KMS to ensure confidentiality, integrity, and availability at minimal costs.

- Server-side encryption by using OSS-managed keys (SSE-OSS)

  OSS uses data keys to encrypt objects and manages the data keys. In addition, OSS uses master keys that are regularly rotated to encrypt data keys.

You can enable server-side encryption in the OSS console by using one of the following methods:

- Method 1: Enable server-side encryption when you create a bucket
- Method 2: Enable server-side encryption on the Basic Settings tab

Method 1: Enable server-side encryption when you create a bucket

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click **Create Bucket**.
3. On the **Create OSS Bucket** page, set parameters.

   You can set the following parameters to configure server-side encryption for the bucket.

   - **Server-Side Encryption**: Specify the encryption methods.
     - **None**: Server-side encryption is not performed.
     - **AES256**: AES256 is used to encrypt each object in the bucket by using different data keys. The CMKs used to encrypt the data keys are rotated regularly.
     - **SM4**: SM4 is used to encrypt each object in the bucket by using different data keys. The CMKs used to encrypt the data keys are rotated regularly.
     - **KMS**: CMKs managed by KMS are used to encrypt objects in the bucket.
   - **Encryption Algorithm**: This parameter can be configured when you select **KMS** for **Server-Side Encryption**. You can select **SM4** or **AES256**.
   - **Key ID**: This parameter can be configured when you select **KMS** for **Server-Side Encryption**. OSS uses the specified CMK to encrypt objects in the bucket.

     > **Note** To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.

4. Click **Submit**.

Method 2: Enable server-side encryption on the Basic Settings tab

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which

you want to configure server-side encryption.

3. Click the **Basic Settings** tab. Find the **Server-side Encryption** section.
4. Click **Configure** and set the following parameters:
   - **Encryption Method**: Specify the encryption method.
     - **None**: Server-side encryption is not performed.
     - **OSS-Managed**: Keys managed by OSS are used to encrypt your data.
     - **KMS**: CMKs managed by KMS are used to encrypt objects in the bucket.
   - **Encryption Algorithm**: You can select **SM4** or **AES256**.
     - **AES256**: AES256 is used to encrypt each object in the bucket by using different data keys. CMKs used to encrypt the data keys are rotated regularly.
     - **SM4**: SM4 is used to encrypt each object in the bucket by using different data keys. CMKs used to encrypt the data keys are rotated regularly.
   - **CMK**: This parameter can be configured when you select **KMS** for **Encryption Method**. OSS uses the specified CMK to encrypt objects in the bucket.

     Note To select a CMK ID for server-side encryption, you must create the CMK in the KMS console.
5. Click **Save**.

Notice The configurations of the default encryption method for a bucket do not affect the encryption configurations of existing objects within the bucket.

6.1.4.13. Bind a bucket to a VPC network

You can bind your bucket to a specified virtual private cloud (VPC) network to allow only requests from IP addresses within the VPC network to access your bucket.

Prerequisites

A VPC network is created. For more information, see the "Create a VPC" chapter of *VPC User Guide*.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that you want to bind to the VPC network.
3. Click the **Overview** tab. Click **Bind VPC** in the **VPC Info** section.
4. On the **Bind VPC** page, select the VPC network that you create.

   You can also click **Create VPC** to create a new VPC network.
5. Click **Submit**.

6.1.4.14. Configure CRR

Cross-region replication (CRR) allows you to perform automatic and asynchronous (near real-time) replication on objects across buckets that are located in different Object Storage Service (OSS) regions. If you enable CRR, operations such as the creation, overwriting, and deletion of objects can be synchronized from the source bucket to the destination bucket.

Prerequisites

The source bucket and destination bucket are created. For more information, see Create buckets.

Context

CRR meets the requirements of geo-disaster recovery or data replication. Objects in the destination bucket are extra duplicates of objects in the source bucket. They have the same names, content, and metadata, such as the created time, owner, user metadata, and object access control list (ACL).

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure CRR.
3. On the bucket details page, click the **Basic Settings** tab. Find the **Cross-Region Replication** section.
4. Click **Enable**. In the **Cross-Region Replication** panel, configure the parameters described in the following table.

Parameter	Description
Source Region	The region in which the current bucket is located.
Source Bucket	The name of the current bucket.
Destination Region	Select the region in which the destination bucket is located. The source and destination buckets for CRR must be located in different regions. Data cannot be synchronized between buckets that are located within the same region.
Destination Bucket	Select the destination bucket to which data is synchronized. The source bucket and destination bucket specified in a CRR rule are not allowed to synchronize data with other buckets. For example, if you configure a CRR rule to synchronize data from Bucket A to Bucket B, Bucket A and Bucket B are not allowed to synchronize data with other buckets.
Applied To	Select the source data that you want to synchronize. ○ **All Files in Source Bucket**: All objects within the source bucket are synchronized to the destination bucket. ○ **Files with Specified Prefix**: Only objects whose names contain one of the specified prefixes are synchronized to the destination bucket. For example, if you have a directory named *management* in the root directory of a bucket and want to synchronize objects in a subdirectory named *abc* in *management*, you can enter the prefix *management/abc*. You can specify up to 10 prefixes.
Operations	Select the synchronization policy. ○ **Add/Change**: Only the added or updated data is synchronized from the source bucket to the destination bucket. ○ **Add/Delete/Change**: All changes to data including the creation, modification, and deletion of objects are synchronized from the source bucket to the destination bucket.

Parameter	Description
Replicate Historical Data	Specify whether to synchronize historical data that exists before you enable CRR for the source bucket. ○ **Yes**: OSS synchronizes historical data to the destination bucket. **Notice** When historical data is synchronized, objects in the destination bucket, which have the same name as objects from the source bucket, may be overwritten. ○ **No**: Only objects that are uploaded or updated after CRR is enabled are synchronized to the destination bucket.

5. Click **OK**.

Note
- It takes 3 to 5 minutes for a CRR rule to take effect after the rule is configured. Synchronization information is displayed after the source data is synchronized to the destination bucket.
- In CRR, data is asynchronously replicated in near real-time. It may take a few minutes to several hours to replicate data to the destination bucket based on the data amount.

6.1.4.15. Configure cross-cloud replication

You can use the cross-cloud replication feature to synchronize Object Storage Service (OSS) data between two clouds. This topic describes how to configure cross-cloud replication.

Step 1: Obtain the parameters of the destination cloud.

Before you configure cross-cloud replication, you must obtain the required parameters of the destination cloud.

1. Log on to the Apsara Uni-manager Operations Console of the destination cloud.

   For more information about how to log on to the Apsara Uni-manager Operations console, see *Log on to the Apsara Uni-manager Operations console* in *Operations and Maintenance Guide*.
2. In the left-side navigation pane, choose **Product Management > Products**.
3. Click **OSS O&M**.
4. In the left-side navigation pane, choose **Service O&M - OSS > Synchronization Management > Cross-Cloud Synchronization**.
5. In the upper-right corner, select the destination cluster from the **Cluster** drop-down list, and then click **View Parameters of the Current Cloud**.

   Record the information displayed in the **Parameters of the Current Cloud** dialog box.

Step 2: Configure cross-cloud synchronization for the source cloud.

After you obtain the required parameters of the destination cloud, you must configure cross-cloud synchronization for the source cloud in the Apsara Uni-manage Operations Console.

1. Log on to the Apsara Uni-manager Operations Console of the source cloud.
2. In the left-side navigation pane, choose **Product Management > Products**.
3. Click **OSS O&M**.
4. In the left-side navigation pane, choose **Service O&M - OSS > Synchronization Management > Cross-Cloud Synchronization**.
5. In the upper-right corner, click **Create**. In the **Create Cross-Cloud Synchronization Task** dialog box, add

the obtained parameters of the destination cloud.

6. Click **Submit**.

   Wait a few minutes until the cross-synchronization configurations take effect.

Step 3: Configure cross-cloud replication in the Apsara Uni-manager Management Console of the source cloud.

After the cross-cloud synchronization configurations take effect, you must configure cross-cloud replication in the Apsara Uni-manager Management Console.

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure cross-cloud replication.
3. On the bucket details page, click the **Basic Settings** tab. In the **Cross-Cloud Replication** section, click **Enable**.
4. In the **Cross-Cloud Replication** panel, configure the parameters described in the following table.

Parameter	Description
Source Region	The region in which the source bucket is located.
Source Bucket	The name of the source bucket.
Destination Cloud	Enter the name of the destination cloud obtained in Step 1.
Destination Cloud Address	Enter the value of Location of the destination cloud obtained in Step 1.
Destination Bucket	Enter the name of the destination bucket.
Applied To	Select the objects that you want to synchronize. ◦ **All Files in Source Bucket**: All objects within the source bucket are synchronized to the destination bucket. ◦ **Files with Specified Prefix**: Only objects whose names contain one of the specified prefixes are synchronized to the destination bucket. Click **Add**. You can add up to 10 prefixes.
Operations	Select a synchronization policy. ◦ **Add/Change**: Only newly added and changed data is synchronized from the source bucket to the destination bucket. ◦ **Add/Delete/Change**: All changes to data including creation, modification, and deletion of objects are synchronized from the source bucket to the destination bucket.

Parameter	Description
Replicate Historical Data	Specify whether to synchronize historical data that is generated before you enable cross-cloud replication. ○ **Yes**: Historical data is synchronized to the destination bucket. ○ **No**: Only objects that are uploaded or updated after cross-cloud replication is enabled are synchronized to the destination bucket.

5. Click **OK** to save your settings.

6.1.4.16. IMG

6.1.4.16.1. Configure image styles

You can encapsulate multiple Image Processing (IMG) parameters in a style and perform complex IMG operations by using the style.

Context

Up to 50 styles can be created for a bucket. These styles can be used only for image objects in the bucket.

Create a style

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to create styles.
3. Click the **Image Processing (IMG)** tab. On the page that appears, click **Create Rule**.
4. In the **Create Rule** panel, configure the style.

   You can use **Basic Edit** or **Advanced Edit** to create a style:

   ○ **Basic Edit**: You can use the IMG features by using the graphical user interface (GUI). For example, resize an image, add a watermark, and modify the image format.

   ○ **Advanced Edit**: You can use the API code to edit the IMG features that you want to use to process an image. The format is: `image/action1,parame_value1/action2,parame_value2/...` .

   Example: `image/resize,p_63/quality,q_90` indicates that the image is scaled down to 63% of the source image, and then the relative quality of the image is set to 90%.

   > **Note** If you want to add image and text watermarks to images at the same time by using a style, use **Advanced Edit** to create the style.

5. Click **OK**.

   After you create a style, you can click **Export** to export the style to a specified local path.

Apply styles

You can perform the following steps to use a created style to process an image object in the current bucket:

1. On the Overview page, click the **Files** tab.
2. Click the name of the image that you want to process.
3. In the **View Details** panel, select an image style from the **Image Style** drop-down list.

   You can view the processed image in the **View Details** panel. Right-click the image and click **Save As** to save

the image to your local disk.

Simplify IMG URLs that include style parameters

IMG URLs that include style parameters generally include the access URL of the image to process, the style parameter and the name of the style. Example: `https://image-demo.oss-cn-qd-ase-d01-a.mytest-inc.com/example.jpg?x-oss-process=style/small`. You can replace `?x-oss-process=style/` with customized delimiters to simplify the IMG URL. For example, if you specify the delimiter as an exclamation point (!), the IMG URL can be simplified to `https://image-demo.oss-cn-qd-ase-d01-a.mytest-inc.com/example.jpg!small`.

1. In the Buckets page, click the **Image Processing (IMG)** tab.
2. Click **Access Settings**.
3. On the **Access Settings** panel, select one of the **Delimiters**.

   Only hyphens (-), underscores (_), forward slashes (/), and exclamation points (?) can be used as delimiters.
4. Click **OK**.

6.1.4.16.2. Configure source image protection

Object Storage Service (OSS) provides the source image protection feature to protect your images from being used by unauthorized anonymous requesters. After you enable source image protection for your bucket, anonymous requesters can access original images in the bucket only by adding style parameters in the requests or by using signed URLs.

Context

You can use the following methods to access the protected original images:

- Use URLs that contain style parameters in the following format: `https://BucketName.Endpoint/ObjectName?x-oss-process=style/StyleName`.
- Use signed URLs in the following format: `https://BucketName.Endpoint/ObjectName?Signature`.

Procedure

1. Log on to the OSS console.
2. Click the **Image Processing (IMG)** tab. On the page that appears, click **Access Settings**.
3. In the **Access Settings** panel, turn on **Protect Source Image File** and configure the parameters described in the following table.

Parameter	Description
Protected File Extensions	Select a file suffix from the **Protected File Extensions** drop-down list. All objects in the bucket that match the specified suffix are protected.
Delimiters	After you select a custom delimiter, you can use the delimiter to replace ?x-oss-process=style/ to simplify the IMG URL. OSS supports the following delimiters: hyphens (-), underscores (_), forward slashes (/), and exclamation points (!). Click the check box before the delimiter that you want to select. For example, if you set the delimiter to an exclamation point (!), the IMG URL can be simplified to the following format: `http(s)//:BucketName.Endpoint/ObjcetName!StyleName`.

4. Click **OK**.

6.1.5. Objects

6.1.5.1. Search for objects

You can search for objects whose names contain specific prefixes in buckets or folders in the OSS console.

Prerequisites

Object are uploaded to the bucket. For more information, see Upload objects.

Context

When you search for objects based on a prefix, search strings are case-sensitive and cannot contain forward slashes (/). You can search for objects only in the root folder of the current bucket or in the current folder. Subfolders and objects stored in subfolders cannot be searched.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the objects that you want to search for are stored.
3. Click the **Files** tab.
4. Search for objects.
   - Search for objects or folders within the root folder of the bucket

     In the upper-right corner, enter the prefix to search in the search box and press Enter or click the icon to search for related objects. Objects and subfolders whose names contain the specified prefix within the root folder of the bucket are displayed.
   - Search for objects or subfolders within a specified folder

     Click the folder in which the objects or subfolders that you want to search for are stored. In the upper-right corner, enter the prefix to search in the search box and press Enter or click the icon to search for related objects. Objects and subfolders whose names contain the specified prefix within the current folder are displayed.

6.1.5.2. Configure object ACLs

You can configure the ACL of an object in the OSS console to control access to the object.

Prerequisites

An object is uploaded to the bucket. For more information, see Upload objects.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket that contains the object whose ACL you want to configure.
3. In the left-side navigation pane, click **Files**.
4. Click the name of the object whose ACL you want to configure. In the **View Details** panel, click **Set ACL** on the right side of **File ACL**.

   You can also choose **More > Set ACL** in the Actions column corresponding to the object whose ACL you want to configure.
5. In the **Set ACL** panel, configure the ACL of the object.

   You can set the ACL of the object to one of the following values:

- **Inherited from Bucket**: The ACL of the object is the same as that of the bucket.
- **Private**: Only the owner or authorized users of this bucket can read and write objects in the bucket. Other users, including anonymous users cannot access the objects in the bucket without authorization.
- **Public Read**: Only the owner or authorized users of this bucket can write objects in the bucket. Other users, including anonymous users can only read objects in the bucket.
- **Public Read/Write**: All users, including anonymous users can read and write objects in the bucket. Fees incurred by such operations are charged to the owner of the bucket. Exercise caution when you set the object ACL to this value.

6. Click **OK**.

6.1.5.3. Create folders

You can use the OSS console to create and simulate basic features of folders in Windows. This topic describes how to create a folder by using the OSS console.

Prerequisites

A bucket is created. For more information, see Create buckets.

Context

OSS does not use a hierarchical structure for objects, but instead uses a flat structure. All elements are stored in buckets as objects. To facilitate object grouping and to simplify management, the OSS console displays objects whose names end with a forward slash (/) as folders. These objects can be uploaded and downloaded. You can use OSS folders in the OSS console in the same manner as you use folders in Windows.

> **Note** The OSS console displays objects whose names end with a forward slash (/) as folders, regardless of whether these objects contain data. The objects can only be downloaded by calling an API operation or by using OSS SDKs.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which you want to create folders.
3. Click the **Files** tab. On the page that appears, click **Create Folder**.
4. In the **Create Folder** panel, enter the folder name.

   The folder name must comply with the following conventions:

   - The name can contain only UTF-8 characters and cannot contain emojis.
   - The name cannot start with a forward slash (/) or backslash (\). The name cannot contain consecutive forward slashes (/). You can use forward slashes (/) in a folder name to quickly create a subfolder. For example, when you create a folder named *example/test/*, the folder named *example/* is created in the root folder of the bucket and the subfolder named *test/* is created in the example/ folder.
   - The name cannot be two consecutive periods (`..`).
   - The folder name must be 1 to 254 characters in length.

5. Click **OK**.

6.1.5.4. Configure bucket policies to authorize other users to access OSS resources

You can configure bucket policies to authorize other users to access specified Object Storage Service (OSS) resources.

Context

You can configure multiple bucket policies for a bucket. However, the total size of the policies cannot exceed 16 KB.

Method 1: Configure bucket policies by using the GUI

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure bucket policies.
3. On the bucket details page that appears, click **Files**. On the page that appears, click **Authorize**.
4. On the **GUI** tab, click **Authorize**.
5. In the **Authorize** panel, configure the parameters and then click **OK**. The following table describes the parameters that you can configure.

Parameter	Description
Applied To	Select the resources that you want to authorize other users to access. ○ **Whole Bucket**: The authorization policy applies to all resources in the whole bucket. ○ **Specified Resource**: The authorization policy applies only to specified resources in the bucket. You can configure multiple bucket policies for specific resources in a bucket. ■ Configure a bucket policy for a directory To configure a bucket policy to authorize users to access all subdirectories and objects within a directory, add an asterisk (*) at the end of the directory name. For example, to authorize users to access all subdirectories and objects within a directory named abc, enter *abc/**. ■ Configure a bucket policy for a specific object To configure a bucket policy to authorize users to access a specific object, enter the full path of the object that excludes the bucket name. For example, to authorize users to access an object named myphoto.png in the abc directory, enter *abc/myphoto.png*.

Parameter	Description
Accounts	Select the type of accounts that you want to authorize. ◦ **Anonymous Accounts (*)**: Select this option if you want to authorize all users to access the specified resources. ◦ **Other Accounts**: Select this option if you want to authorize other Apsara Stack tenant accounts, Resource Access Management (RAM) users, or users that use a temporary token generated by Security Token Service (STS) to access the specified resources. ■ To authorize other Apsara Stack tenant accounts or RAM users to access the specified resources, enter the UIDs of the accounts or RAM users. ■ To authorize users that use a temporary token generated by STS to access the specified resources, enter the user and role information in the following format: `arn:sts::{RoleOwnerUid}:assumed-role/{RoleName}/{RoleSessionName}`. For example, the role used to generate a user that uses a temporary token generated by STS is testrole, the UID of the Apsara Stack tenant account that owns the role is 12345, and the RoleSessionName that is specified when the temporary user is generated is testsession. In this case, enter `arn:sts::12345:assumed-role/testrole/testsession`. To authorize all users that use a temporary token generated by STS to access the specified resources, use asterisks (*) as wildcards. For example, enter `arn:sts::*:*/*/*`. **Notice** If an authorized user is a user that uses a temporary token generated by STS, the user cannot access the specified resources on the OSS console.
Authorized Operation	You can use the following methods to specify authorized operations: **Basic Settings** and **Advanced Settings**. ◦ Basic Settings If you select this method, you can configure the following permissions based on your requirements. You can move the pointer over the icon on the right side of each permission to view the actions that correspond to the permission option. ■ **Read Only**: Authorized users can view, list, and download the specified resources. ■ **Read/Write**: Authorized users can read data from and write data to the specified resources. ■ **Any Operation**: Authorized users can perform all operations on the specified resources. ■ **None**: Authorized users cannot perform operations on the specified resources. **Notice** If multiple bucket policies are configured for a user, the user has all the permissions defined in these policies. However, a policy in which Authorized Operation is set to **None** takes precedence over other policies. For example, if you configure a policy to grant the **Read Only** permission to a user, and then configure another policy to grant the **Read/Write** permission to the same user, the permission of the user is **Read/Write**. If you configure a third policy to grant the **None** permission to the user, the permission of the user is **None**. ◦ Advanced Settings If you select this method, you must configure the following parameters: ■ **Effect**: Select Allow or Deny. ■ **Action**: Specify the operation that you want to allow or deny. You can specify any action that is supported by OSS.

Parameter	Description
Conditions	Optional. You can configure this parameter in both Basic Settings and Advanced Settings to specify the conditions that users must meet to access the specified OSS resources. ○ **Access Method**: Select HTTPS or HTTP. ○ **IP =**: Specify the IP addresses or Classless Inter-Domain Routing (CIDR) blocks that can be used to access the specified OSS resources. Separate multiple IP addresses with commas (,). ○ **IP ≠**: Specify IP addresses or CIDR blocks that cannot be used to access OSS resources. Separate multiple IP addresses with commas (,).

6. Click **OK**.

Method 2: Configure bucket policies by specifying policy syntax

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket for which you want to configure bucket policies.
3. On the bucket details page that appears, click **Files**. On the page that appears, click **Authorize**.
4. On the **Syntax** tab, click **Edit**.

   You can specify policy syntax based on your requirements to manage fine-grained permissions. The following examples describe the bucket policies configured by the resource owner whose UID is `174649585760xxxx` in different scenarios:

   ○ Example 1: Allow anonymous users to list all objects in a bucket named examplebucket.

```
{
    "Statement": [
        {
            "Action": [
                "oss:ListObjects",
                "oss:ListObjectVersions"
            ],
            "Effect": "Allow",
            "Principal": [
                "*"
            ],
            "Resource": [
                "acs:oss:*:174649585760xxxx:examplebucket"
            ]
        },
    ],
    "Version": "1"
}
```

   ○ Example 2: Forbid anonymous users whose IP addresses are not in the CIDR block `192.168.0.0/16` from performing operations on a bucket named examplebucket.

```
{
    "Version": "1",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "oss:*",
            "Principal": [
                "*"
            ],
            "Resource": [
                "acs:oss:*:174649585760xxxx:examplebucket"
            ],
            "Condition":{
                "NotIpAddress": {
                    "acs:SourceIp": ["192.168.0.0/16"]
                }
            }
        }
    ]
}
```

- Example 3: Allow a RAM user whose UID is `20214760404935xxxx` only to read the `hangzhou/2020` and `hangzhou/2015` directories in a bucket named examplebucket.

```
{
    "Statement": [
        {
            "Action": [
                "oss:GetObject",
                "oss:GetObjectAcl",
                "oss:GetObjectVersion",
                "oss:GetObjectVersionAcl"
            ],
            "Effect": "Allow",
            "Principal": [
                "20214760404935xxxx"
            ],
            "Resource": [
                "acs:oss:*:174649585760xxxx:examplebucket/hanghzou/2020/*",
                "acs:oss:*:174649585760xxxx:examplebucket/hangzhou/2015/*"
            ]
        },
        {
            "Action": [
                "oss:ListObjects",
                "oss:ListObjectVersions"
            ],
            "Condition": {
                "StringLike": {
                    "oss:Prefix": [
                        "hanghzou/2020/*",
                        "hangzhou/2015/*"
                    ]
                }
            },
            "Effect": "Allow",
            "Principal": [
                "20214760404935xxxx"
            ],
            "Resource": [
                "acs:oss:*:174649585760xxxx:examplebucket"
            ]
        }
    ],
    "Version": "1"
}
```

5. Click **Save**.

Access authorized OSS resources

After you configure a bucket policy for a bucket, you can use the following methods to access the resources specified in the policy:

- Object URL (only for authorized anonymous users)

  Anonymous users can enter the URL of an object specified in the policy in a browser to access the object. The URL of the object consists of the default domain name of the bucket and the path of the object. Example: `http://mybucket.oss-cn-beijing.aliyuncs.com/file/myphoto.png`.

- OSS console

  Log on to the OSS console. In the left-side navigation pane, click the + icon next to **My OSS Paths**. In the Add Path panel, add the region in which the bucket is located and object path specified in the bucket policy. For more information, see Add OSS paths.

6.1.5.5. Delete objects

You can delete uploaded objects in the OSS console when they are no longer needed.

Context

You can delete a single object or batch delete multiple objects. You can batch delete up to 100 objects. To delete specific objects or batch delete more than 100 objects, we recommend that you use API operations or OSS SDKs.

> **Notice** Deleted objects cannot be recovered. Exercise caution when you delete objects.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the objects you want to delete are stored.
3. In the left-side navigation pane, click **Files**.
4. Select one or more objects that you want to delete in the object list, and then choose **Batch Operation > Delete**.

   You can also choose **More > Completely Delete** in the Actions column corresponding to the object you want to delete.
5. In the dialog box that appears, click **OK**.

6.1.5.6. Manage parts

When you use multipart upload to upload an object, the object is split into several parts. After all of the parts are uploaded to the OSS server, you can call CompleteMultipartUpload to combine the parts into a complete object.

Context

You can also configure lifecycle rules to clear parts that are not needed on a regular basis. For more information, see Manage lifecycle rules.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation pane, click **Buckets**. On the Buckets page, click the name of the bucket in which the parts you want to delete are stored.
3. Click the **Files** tab. On the page that appears, click **Parts**.
4. In the **Parts** panel, delete the parts.
   - To delete all parts in the bucket, select all parts and then click **Delete All**.
   - To delete specific parts in the bucket, select these parts and then click **Delete**.
5. In the dialog box that appears, click **OK**.

6.1.6. Create single tunnels

You can create single tunnels between OSS and a virtual private cloud (VPC) to access OSS resources from the VPC.

Prerequisites

A VPC and a vSwitch are created.

For more information, see the *Create a VPC* and *Create a vSwitch* topics in *VPC User Guide*.

Procedure

1. Log on to the OSS console.
2. In the left-side navigation panel, click **Create Single Tunnel**.
3. Click **Create**.
4. On the **Create Single Tunnel** page, configure the parameters described in the following table.

Parameter	Required	Description
Organization	Yes	Select the organization of the VPC from which you want to access OSS resources.
Resource Set	Yes	After you select an organization, the resource set is automatically selected based on the organization.
Region	Yes	After you select an organization, a region is automatically selected based on the organization.
Description	No	Enter the description of the single tunnel you want to create. The description cannot exceed 180 characters in length.
VPC	Yes	Select the VPC that you created. You can also click **Create VPC** to create a VPC.
vSwitch	Yes	Select the vSwitch that you created. You can also click **Create vSwitch** to create a vSwitch.

5. Click **Submit**.

6.1.7. Add OSS paths

You can add the paths of OSS resources in the console for quicker access.

Prerequisites

A bucket is created. For more information about how to create a bucket, see Create buckets.

Procedure

1. Log on to the OSS console.
2. Click the + icon on the right side of **My OSS Paths**.
3. In the **Add Authorized OSS Path** panel, add a path.

   You can configure the following parameters to add a path.

   - **Region**: Select the region of the bucket in the path that you want to add.
   - **File Path**: Add the path of the resource that you want to access. The path is in the `bucket/object-prefix` format. For example, if the OSS resource that you want to access is the root folder of a bucket named *example*, set File Path to *example*. If the OSS resource that you want to access is the *test* folder in the root folder of the bucket named *example*, set File Path to *example/test/*.

7.Apsara File Storage NAS

7.1. User Guide

7.1.1. What is NAS?

Apsara File Storage NAS is a cloud service that provides a file storage solution for compute nodes. The compute nodes include Elastic Compute Service (ECS) instances, Elastic High-Performance Computing (E-HPC) instances, and Container Service for Kubernetes (ACK) clusters.

NAS provides standard file access protocols. You can use the distributed file storage solution that provides shared access, scalability, high reliability, and high performance without the need to modify the configurations of the applications. You can mount a NAS file system on multiple compute nodes at a time. This reduces a large number of costs in data transmission and synchronization.

You can perform the following operations:

- Create a NAS file system and mount target.
- Create a permission group for the file system and add rules to the permission group. This allows access from specific IP addresses or CIDR blocks to the file system. This also allows you to grant different levels of access permissions to the IP addresses or CIDR blocks.
- Mount the file system on compute nodes. The compute nodes include ECS instances and ACK clusters. NAS allows you to access the file system by using the Network File System (NFS) and Server Message Block (SMB) protocols. You can also call POSIX-based APIs to access the file system.
- Manage file systems, mount targets, and permission groups in the NAS console.
- Call NAS API operations to manage file systems.

7.1.2. Precautions

Before you use NAS, you must familiarize yourself with the following limits.

Limits on file systems

- Maximum number of files in a single file system: 1 billion.
- Maximum name length: 255 bytes.
- Maximum size of a single file: 32 TB.
- Maximum directory depth: 1,000 levels deep.
- Maximum capacity of a single file system: 10 PB for NAS Capacity and 1 PB for NAS Performance.
- Maximum number of compute nodes on which you can mount a single file system: 10,000. Note: The file system allows simultaneous access from the 10,000 compute nodes.
- Maximum size of a protocol packet: 4 MB.
- Maximum number of Change Notify requests: 512.

Limits on NFS clients

Limits on the usage of NFS clients are listed as follows.

- You can open a maximum of 32,768 files at a time on an NFS client. Files in the list folder and its subfolders are not counted as part of the total number of open files.
- Each unique mount on an NFS client can acquire a maximum of 8,192 locks across a maximum of 256 unique file or process pairs. For example, a single process can acquire one or more locks on 256 separate files, or 8 processes can each acquire one or more locks on 32 files.
- We recommend that you do not use an NFS client in a Windows environment to access an NFS file system.

Limits on SMB clients

Each file or folder can be opened a maximum of 8,192 times in parallel across compute nodes that each have a file system mounted and users that share access to each of these file systems. This represents a maximum of 8,192 active file handlers for each file system. A maximum of 65,536 active file handlers can exist on a file system.

Limits on the NFS protocol

- NAS supports the NFSv3 and NFSv4 protocols.
- NFSv4.0 does not support the following attributes: FATTR4_MIMETYPE, FATTR4_QUOTA_AVAIL_HARD, FATTR4_QUOTA_AVAIL_SOFT, FATTR4_QUOTA_USED, FATTR4_TIME_BACKUP, and FATTR4_TIME_CREATE. If one of the preceding attributes is applied to a file system, an NFS4ERR_ATTRNOTSUPP error appears on a client that has the file system mounted.
- NFSv4.1 does not support the following attributes: FATTR4_DIR_NOTIF_DELAY, FATTR4_DIR_NOTIF_DELAY, FATTR4_DACL, FATTR4_SACL, FATTR4_CHANGE_POLICY, FATTR4_FS_STATUS, FATTR4_LAYOUT_HINT, FATTR4_LAYOUT_TYPES, FATTR4_LAYOUT_ALIGNMENT, FATTR4_FS_LOCATIONS_INFO, FATTR4_MDSTHRESHOLD, FATTR4_RETENTION_GET, FATTR4_RETENTION_SET, FATTR4_RETENTEVT_GET, FATTR4_RETENTEVT_SET, FATTR4_RETENTION_HOLD, FATTR4_MODE_SET_MASKED, FATTR4_FS_CHARSET_CAP. If one of the preceding attributes is applied to a file system, an NFS4ERR_ATTRNOTSUPP error appears on a client that has the file system mounted.
- NFSv4 does not support the following operations: OP_DELEGPURGE, OP_DELEGRETURN, and NFS4_OP_OPENATTR. If one of the preceding operations is applied to a file system, an NFS4ERR_ATTRNOTSUPP error appears on a client that has the file system mounted.
- NFSv4 does not support delegations.
- The following issues are related to user IDs (UIDs) and group IDs (GIDs):
  - On Linux, mappings between UIDs or GIDs and usernames or group names are defined in configurations files. For NFSv3 file systems, if the mapping between an ID and a name is defined in a configuration file, the name is displayed. If no mapping can be found for a UID or GID, the UID or GID is displayed.
  - For NFSv4 file systems, the usernames and group names are displayed as nobody for all files if the version of a Linux kernel is earlier than 3.0. If the kernel version is later than 3.0, the rule used by NFSv3 file systems applies to display files.

> **Notice** If a file or directory is stored on an NFSv4 file system and the Linux kernel version is earlier than 3.0, we recommend that you do not use the chown or chgrp command. If you use either one of the commands, the UID and GID of the file or directory will change to nobody.

Limits on the SMB protocol

- NAS supports protocols including SMB 2.1 or later and operating systems including Windows 7, and Windows Server 2008 R2 or later. However, NAS does not support Windows Vista, or Windows Server 2008 or earlier. Compared with SMB 2.1 or later, SMB 1.0 has lower performance and functionality. Furthermore, Windows products that support SMB 1.0 are no longer offered or supported.
- Extended file attributes and client-side caching based on leases.
- Input/output control (IOCTL) or file system control (FSCTL) operations, such as creating sparse files, compressing files, retrieving NIC status, and creating reparse points.
- Alternate data streams.
- Identity authentication provided by Active Directory (AD) or Lightweight Directory Access Protocol (LDAP).
- Several features provided by SMB 3.0 or later, such as SMB Direct, SMB Multichannel, SMB Directory Leasing, and persistent handles.
- Access control lists (ACLs) on files or directories.

7.1.3. Quick start

7.1.3.1. Log on to the NAS console

This topic describes how to log on to the Apsara File Storage NAS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

5. In the top navigation bar, click **Products**. In the **Storage** section, click **Apsara File Storage NAS**.

7.1.3.2. Create a file system

This topic describes how to create a file system in the Apsara File Storage NAS console.

Context

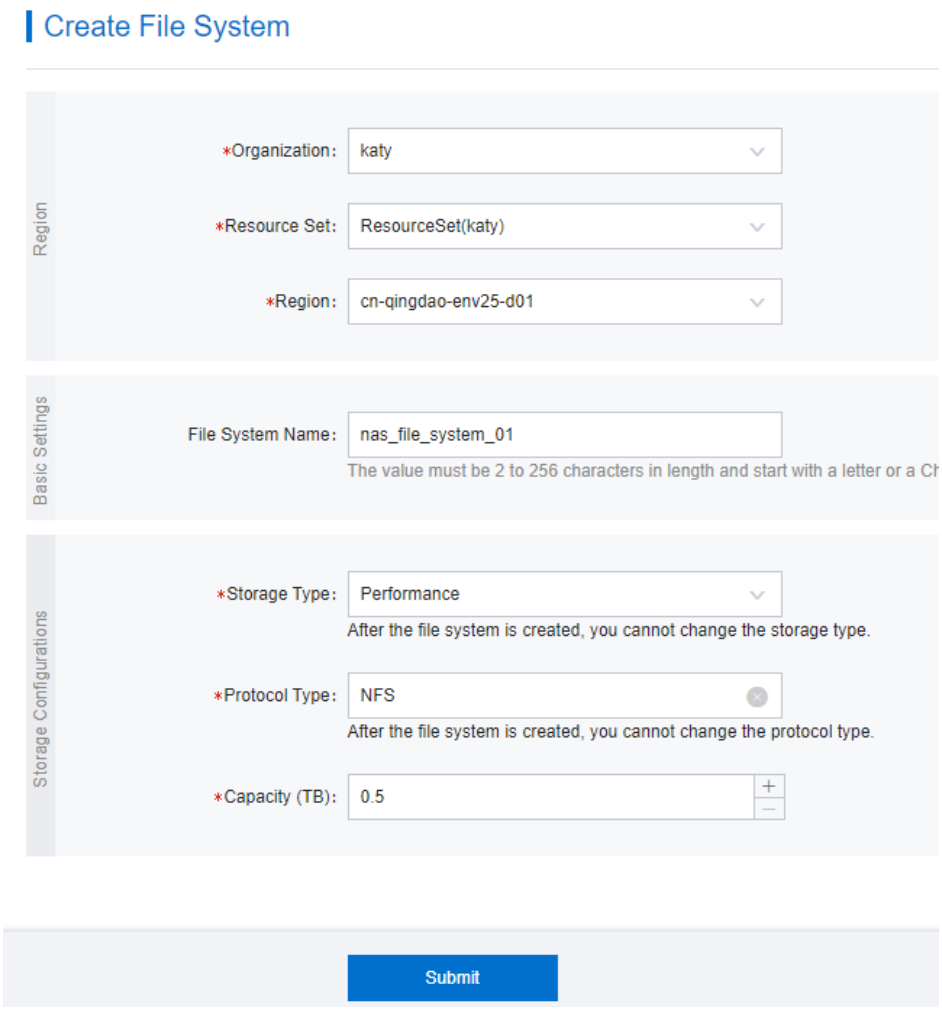
Before you create a file system, you must note the following limitations:

- You can use an Alibaba Cloud account to create a maximum of 1,000 file systems.
- The maximum capacity of a NAS Performance file system is 1 PB. The maximum capacity of a NAS Capacity file system is 10 PB.

If you want to increase the maximum storage capacity, we recommend that you contact Alibaba Cloud Technical Support.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List** and click **Create File System**.
3. In the **Create File System** dialog box, set the required parameters.



The following table lists the required parameters.

Parameter	Description
Region	Select a region where you need to create a file system.
Organization	Select an organization from the drop-down list for the instance.
Resource Set	Select a resource set from the drop-down list for the instance.
File System Name	The name of the file system. The name must be 2 o 256 characters in length and can contain letters, digits, and special characters. These special characters include underscores (_) and hyphens (-). The name must start with a letter and cannot start with http:// or https://.

Parameter	Description
Storage Type	The storage type. Select **Performance** or **Capacity** based on your business requirements. The maximum capacity of an NAS Performance file system is 1 PB. The maximum capacity of an NAS Capacity file system is 10 PB.
Protocol Type	The protocol type. Select **NFS** or **SMB** based on your business requirements. We recommend that you mount Network File System (NFS) file systems on Linux clients and Server Message Block (SMB) file systems on Windows clients.
Capacity (TB)	The capacity of the file system. ◦ The capacity of an NAS Performance file system ranges from 0.5 TB to 1024 TB. ◦ The capacity of an NAS Capacity file system ranges from 0.5 TB to 10240 TB.

4. Click **OK** to complete the creation.

7.1.3.3. Create a permission group and add rules

This topic describes how to create a permission group and add rules to the permission group in the Apsara File Storage NAS console.

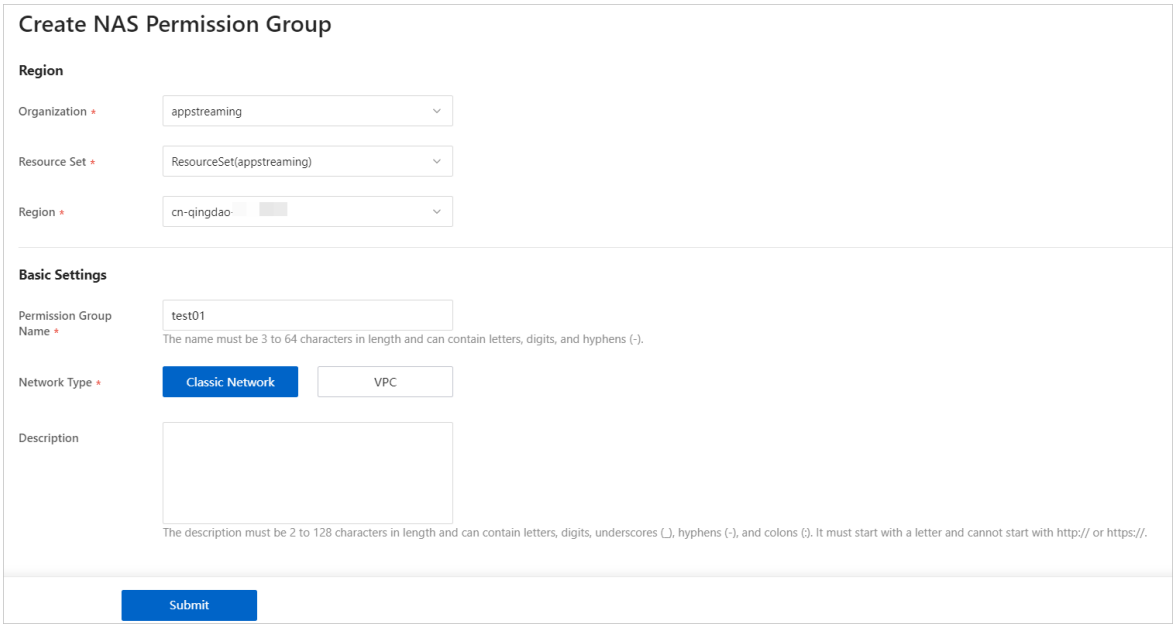
Context

In NAS, each permission group represents a whitelist. You can add rules to a permission group to allow access to a file system from specific IP addresses or CIDR blocks. You can also grant different access permissions to different IP addresses or CIDR blocks.

> **Note** You can use an Alibaba Cloud account to create a maximum of 100 permission groups. If you want to increase the limit, we recommend that you contact Alibaba Cloud Technical Support.

Creates a permission group

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > Permission Group** and click **Create Permission Group**.
3. In the **Create Permission Group** dialog box, specify the required parameters.



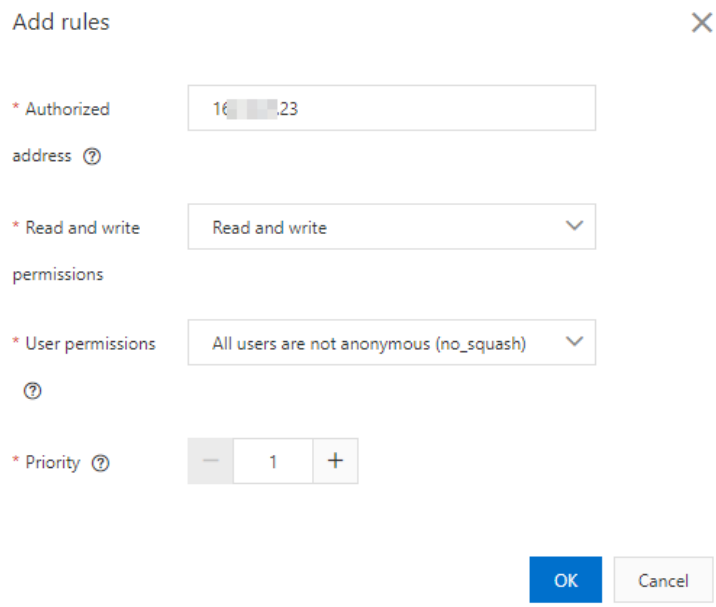
The following table lists the required parameters.

Parameter	Description
Organization	The organization to which the permission group belongs.
Resource Set	The resource set to which the permission group belongs.
Region	The region where you want to create the permission group.
Name	The name of the permission group. The name must be 3 to 64 characters in length and can contain letters, digits, and hypens (-).
Network Type	The network type. Select **Classic Network** or **VPC** based on your business requirements.

4. Click **OK** to complete the creation of the permission group.

Create a rule

1. Log on to the Apsara File Storage NAS console.
2. On the **Permission Group** page, find the target permission group and click **Manage**.
3. Click **Add Rule**.
4. In the **Add Rule** dialog box that appears, specify the required parameters.



The following table lists the required parameters.

Parameter	Description
Authorization Address	Specifies the authorized object to which the rule applies. You can specify an IP address or CIDR block. Only IP addresses are available for permission groups of the classic network type.
Read/Write Permission	Specifies whether to allow read-only or read/write access to the file system from the authorized object. Valid values: **Read-only** and **Read/Write**.
User Permission	Specifies whether to limit a Linux user's access to a file system. ◦ **Do not limit root users (no_squash)**: allows access to a file system from root users. ◦ **Limit root users (root_squash)**: denies access to a file system from root users. All root users are treated as nobody users. ◦ **Limit all users (all_squash)**: denies access to a file system from all users including root users. All users are treated as nobody users. The nobody user is created by default on Linux. The user has only the most basic permissions and can access only the open content of servers. This feature offers high security.
Priority	When multiple rules are applied to an authorized object, the rule with the highest priority takes effect. Valid values: 1 to 100, in which 1 is the highest priority.

5. Click **OK** to complete the creation of the rule.

7.1.3.4. Add a mount target

This topic describes how to add a mount target. After an Apsara File Storage NAS file system is created, you must add a mount target to the file system. Then, you can use the mount target to mount the file system on compute nodes. These compute nodes include Elastic Compute Service (ECS) instances and Alibaba Cloud Container Service for Kubernetes (ACK) nodes.

Prerequisites

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.

Context

A mount target is an endpoint that resides in a VPC or classic network. Each mount target corresponds to a file system. Mount targets of the VPC and classic network types are available for NAS file systems.

> **Note** You use a mount target to mount a file system on multiple compute nodes for shared access. These compute nodes include ECS instances and ACK nodes.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. On the **Mount Target** tab, click **Add Mount Target**.
5. In the **Add Mount Target** dialog box that appears, specify the required parameters.

   Mount Target Type: includes **VPC** and **Classic Network**.

   > **Note** Mount targets of the classic network type allow access only from ECS instances that belong to the same Alibaba Cloud account as the mount targets.

   - If you want to create a mount target of the VPC type, specify the following parameters.

Parameter	Description
VPC	The VPC. **Note** The VPC you specify must be the same as the VPC where the compute nodes reside. These compute nodes include ECS instances and ACK nodes.

Parameter	Description
VSwitch	The VSwitch.
Permission Group	The permission group.

- If you want to create a mount target of the classic network type, specify the following parameters.

Parameter	Description
Permission Group	The permission group.

6. Click **OK** to complete the configuration.

7.1.3.5. Mount an NFS file system

This topic describes how to mount a Network File System (NFS) file system. Before you mount a file system, you must create the file system and a mount target for the file system. Then, you can use the mount target to mount the file system on compute nodes. These compute nodes include Elastic Compute Service (ECS) instances and Alibaba Cloud Container Service for Kubernetes (ACK) nodes.

Prerequisites

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.
- A mount target is created. This topic takes a mount target of the VPC type as an example. For more information, see Add a mount target.
  - If you create a mount target of the VPC type for a file system, you can mount the file system only on ECS instances that reside in the same VPC as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the VPC that hosts the ECS instances.
  - If you create a mount target of the classic network type for a file system, you can mount the file system only on ECS instances that belong to the same Alibaba Cloud account as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the private network that hosts the ECS instances.
- A compute node is created. This topic takes a Linux ECS instance as an example.

Step 1: Install an NFS client

Before you mount an NFS file system on a Linux ECS instance, you must install an NFS client. If an NFS client is instaned, skip this step.

1. Log on to the Linux ECS instance. For more information, see the **Quick start > Connect to an ECS instance** topic of the *ECS User Guide* .
2. Install the NFS client.
   - If CentOS, RHEL, or Aliyun Linux runs on the ECS instance, use the following command to install the NFS client.

     ```
     sudo yum install nfs-utils
     ```

   - If Ubuntu or Debian runs on the ECS instance, use the following commands to install the NFS client.

     ```
     sudo apt-get update
     ```

     ```
     sudo apt-get install nfs-common
     ```

Step 2: Mount an NFS file system

1. Log on to the Linux ECS instance. For more information, see the **Quick start > Connect to an ECS instance** topic of the *ECS User Guide* .
2. Mount the NFS file system.

   Use the following command to mount the NFS file system. In the command, replace file-system-id.region.nas.aliyuncs.com:/ /mnt with a value that is specific to your environment.

   - To mount an NFSv4 file system, use the following command.

     ```
     sudo mount -t nfs -o vers=4.0,minorversion=0,rsize=1048576,wsize=1048576,hard,timeo=600,retrans=2,noresvport file-system-id.region.nas.aliyuncs.com:/ /mnt
     ```

   - To mount an NFSv3 file system, use the following command.

     ```
     sudo mount -t nfs -o vers=3,nolock,proto=tcp,rsize=1048576,wsize=1048576,hard,timeo=600,retrans=2,noresvport file-system-id.region.nas.aliyuncs.com:/ /mnt
     ```

     Mount parameters

Parameter	Description
file-system-id.region.nas.aliyuncs.com:/ /mnt	Specifies the mount target of the NAS file system, the forward slash (/) following the mount target specifies the root directory of the NAS file system, and /mnt specifies a local directory that resides on the Linux ECS instance. You must replace the example values based on your business requirements. ■ The mount target, for example, file-system-id.region.nas.aliyuncs.com. To obtain information about a mount target, follow these steps. Log on to the NAS console, find the target system, click **Manage** next to the file system to go to the Details page. The Details page shows information about the mount target. ■ The directory of the NAS file system: specifies the root directory (/) or a subdirectory (/sub1). If a subdirectory is specified, make sure that the subdirectory exists. ■ The local directory on which you want to mount a file system: specifies the root directory (/) or a subdirectory (/mnt) of a system such as Linux. If a subdirectory is specified, make sure that the subdirectory exists.
vers	The version of the file system. Only NFSv3 and NFSv4 are available.
Mount option	When you mount a file system, multiple mount options are available. Separate multiple mount options with commas (,). For more information, see the following Mount options. **Note** When you specify mount options, take note of the following items. ■ To avoid a decrease in performance, we recommend that you specify the maximum value (1048576) for both the rsize mount option and the wsize mount option. ■ If you need to modify the timeo mount option, we recommend that you specify a minimum of 150 for the mount option. The timeo mount option is measured in deciseconds (tenths of a second). For example, a value of 150 indicates 15 seconds. ■ To avoid data inconsistency, we recommend that you do not use the soft mount option. Use caution with the soft mount option. ■ We recommend that you use the default values for other mount options. For example, a decrease in performance may occur due to changes in some mount options. These mount options include the size of the read or write buffer or the use of attribute caching.

Mount options

Option	Description
rsize	Specifies the maximum number of bytes in each read request that the NFS client can receive. Recommended value: 1048576.
wsize	Specifies the maximum number of bytes in each write request that the NFS client can send. Recommended value: 1048576.
hard	Specifies that applications must stop accessing a file system when the file system is unavailable, and wait until the file system is available. We recommended that you use the hard mount option.
timeo	Specifies the time in deciseconds (tenths of a seconds) that the NFS client waits before it retries an NFS request. Recommended value: 600.
retrans	Specifies the number of times the NFS client retries a request. Recommended value: 2.
noresvport	Specifies that the NFS client uses a different TCP source port for a new network connection to ensure data integrity. We recommend that you use the noresvport mount option.

3. Use the `mount -l` command to view the mount result.

   The following figure shows an example of a successful mount.

   After a file system is mounted, you can use the `df -h` command to view the size of the file system.

4. After you mount an NAS file system on an ECS instance, you can access the file system from the ECS instance.

   You can access the file system in the same way you access a local directory. The following figure shows an example.

7.1.3.6. Mount an SMB file system

This topic describes how to mount a Server Message Block (SMB) file system. Before you mount a file system, you must create the file system and a mount target for the file system. Then, you can use the mount target to mount the file system on compute nodes such as Elastic Compute Service (ECS) instances.

Prerequisites

1. A file system is created. For more information, see Create a file system.
2. A permission group and a rule are created. For more information, see Create a permission group and add rules.
3. A mount target is created. This topic takes a mount target of the Classic Network type as an example. For more information, see Add a mount target.
   - If you create a mount target of the VPC type for a file system, you can mount the file system only on ECS instances that reside in the same VPC as the mount target. You can specify a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the VPC that hosts the ECS instances.
   - If you create a mount target of the Classic Network type for a file system, you can mount the file system only on ECS instances that belong to the same Alibaba Cloud account as the mount target. You can specify

a permission group for the mount target. Then, you can add several rules to the permission group. The authorization address of a rule must match the IP range of the private network that hosts the ECS instances.

4. An ECS instance is created. This topic takes a Windows ECS instance as an example.
5. The following Windows services are started:
   - Workstation
     a. Choose **All Programs > Accessories > Run**, or press `Win+R` and enter `services.msc` to open the Services console.
     b. Find the Workstation service and ensure that the service is **Running** and the startup type is **Automatic**.

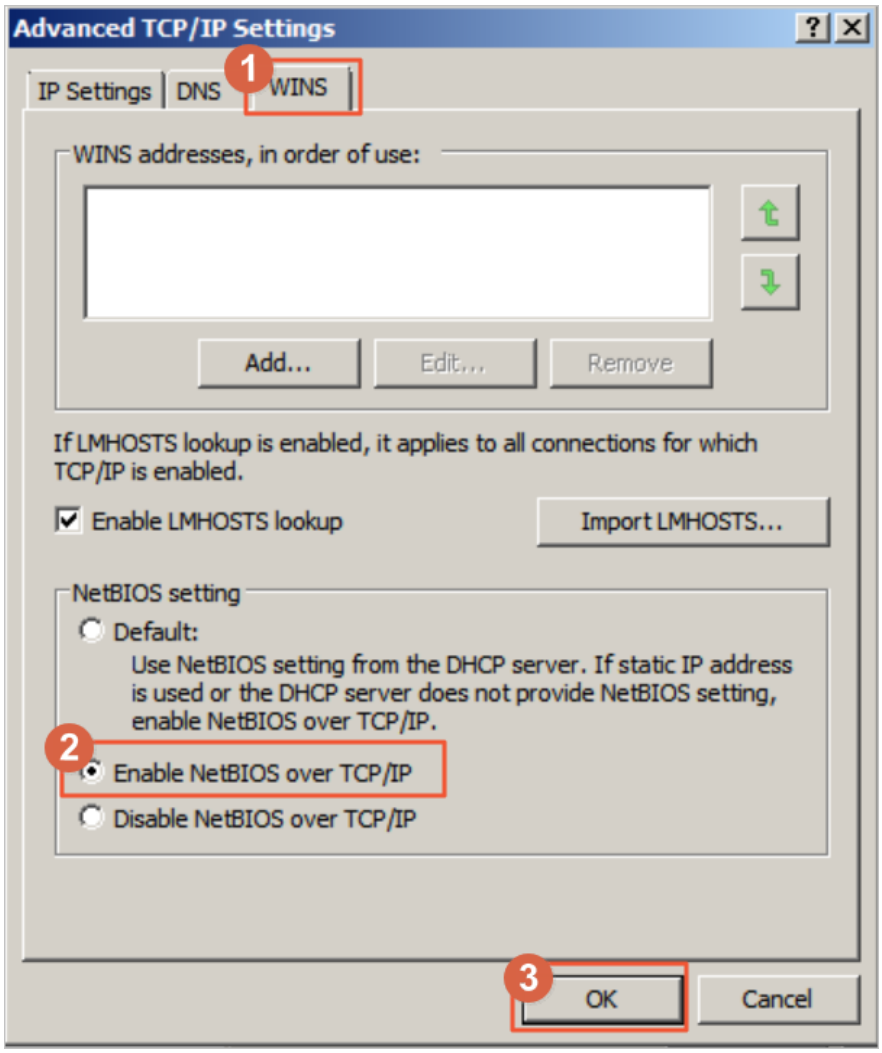
     The default state for the Workstation service is Running.

   - TCP/IP NetBIOS Helper

     Follow these steps to start the TCP/IP NetBIOS Helper service:

     a. Double-click **Network and Sharing Center** and right-click the active network connection.
     b. Click **Properties** to open the Local Area Network Properties dialog box. Double-click **Internet Protocol Version 4 (TCP/IPv4)** to open the Internet Protocol Version 4 (TCP/IPv4) Properties dialog box, and then click **Advanced**.

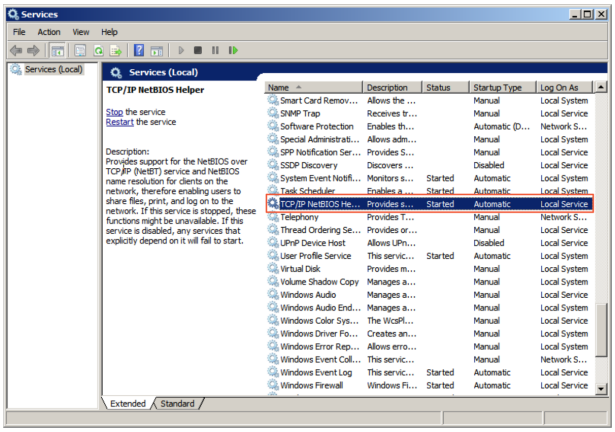
c. In the **Advanced TCP/IP Settings** dialog box, choose **WINS > Enable NetBIOS over TCP/IP**.



d. Choose **All Programs > Accessories > Run**, or press `Win+R` and enter `services.msc` to open the Services console.

e. Find the TCP/IP NetBIOS Helper service and make sure that the service is **Running** and the startup type is **Automatic**.

The default state for the TCP/IP NetBIOS Helper service is Running.



Procedure

1. Log on to a Windows ECS instance. For more information, see the **Quick start > Connect to an ECS instance** topic of the *ECS User Guide*.
2. Open the command prompt and use the following command to mount the file system.

   ```
   net use D: \\file-system-id.region.nas.aliyuncs.com\myshare
   ```

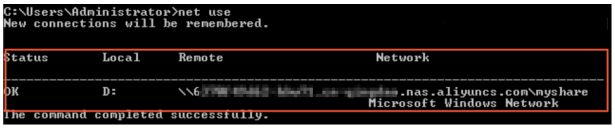
   The syntax of the command is `net use <the letter of a local drive> \\<the domain name of a mount target>\myshare`.

   - The letter of a local drive: specifies a drive on which you need to mount a file system. You can specify the target drive based on your business requirements.

     > **Note** The target drive must be different from any existing drives.

   - The domain name of the mount target: When you create a mount target for a file system, the domain name of the mount target is automatically generated. You can replace the domain name based on your business requirements. To obtain the mount target of the file system, follow these steps. Log on to the NAS console, find the target file system, and click **Manage** to go to the Details page.
   - myshare: specifies the name of an SMB share. You cannot change the name.
3. Use the `net use` command to check mount results.

   The following figure shows an example of a successful mount.

4. After you mount an NAS file system on an ECS instance, you can access the file system from the ECS instance.

7.1.4. File systems

7.1.4.1. View the details of a file system

This topic describes how to view the details of a file system. The details include the information of the file system and the attached mount targets. You can view the details of a file system in the Apsara File Storage NAS console.

Prerequisites

A file system is created. For more information, see Create a file system.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the file system and click **Management** to go to the details page of the file system.

   The details page consists of the following sections:

   - **Basic Information**: In this section, the information of the file system is displayed. The information includes the ID, region, protocol type, and storage specifications.
   - **Mounting Use**: In this section, the list of mount targets attached to the file system is displayed. You can manage the mount targets and view the clients on which the file system is mounted.
   - **Quota Management**: In this section, the quota status of each directory in the file system is displayed. You can add, edit, and delete quotas for each directory.

7.1.4.2. Delete a file system

This topic describes how to delete a file system in the Apsara File Storage NAS console.

Prerequisites

A file system is created. For more information, see Create a file system.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system, and click **Manage**.

   > **Note**
   > - Before you can delete a file system, you must remove all mount targets from the file system.
   > - Use caution when you delete a file system. After a file system is deleted, the data on the file system cannot be restored. We recommend that you ensure that all data is backed up.

4. In the **Delete File System** dialog box, click **OK** to complete the deletion.

7.1.4.3. Scale up a file system

If the used space of an Apsara File Storage NAS file system reaches the configured capacity, data can no longer be written to the file system. To ensure the availability of the NAS service, we recommend that you scale up the file system before the used space reaches the configured capacity. This topic describes how to scale up a file system in the NAS console.

Prerequisites

A file system is created. For more information, see Create a file system.

> **Notice** A file system can be scaled up but cannot be scaled down. A NAS Performance file system can be scaled up to a maximum of 1 PB. A NAS Capacity file system can be scaled up to a maximum of 10 PB.

Procedure

1.
2. In the left-side navigation pane, choose **File System > File System List**.
3. Find the file system and click **Upgrade** in the **Operations** column.
4. In the **Upgrade** dialog box, enter the scaled capacity of the file system in the **New Total Capacity** field.
5. Click **OK**.

7.1.5. Mount targets

7.1.5.1. View mount targets

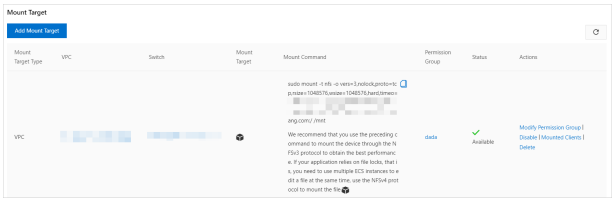
This topic describes how to view mount targets in the Apsara File Storage NAS console.

Context

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.
- A mount target is created. For more information, see Add a mount target.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. In the **Mount Target** section, view mount targets in the file system.



7.1.5.2. Enable or disable a mount target

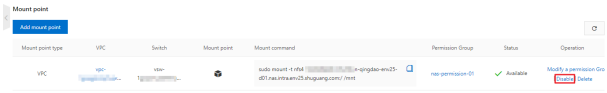
This topic describes how to enable or disable a mount target. You can control access to a mount target from clients by enabling or disabling the mount target.

Prerequisites

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.
- A mount target is created. For more information, see Add a mount target.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system and click **Manage**.
4. After you find the mount target that you want to disable or enable, you can perform the following operations:
   - Disable the mount target. Click **Disable**. In the Disable Mount Target dialog box, click **OK** to deny access to the mount target from clients.
   - Enable the mount target. Click **Enable**. In the Enable Mount Target dialog box, click **OK** to allow access to the mount target from clients.



7.1.5.3. Delete a mount target

This topic describes how to delete a mount target in the Apsara File Storage NAS console.

Prerequisites

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.
- A mount target is created. For more information, see Add a mount target.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.

3. Find the target file system and click **Manage**.
4. Find the mount target that you want to delete and click **Delete**.

> **Note** Use caution when you delete a mount target. After you delete a mount target, the mount target cannot be restored.

5. In the Delete Mount Target dialog box, click **OK**.

7.1.5.4. Modify the permission group of a mount target

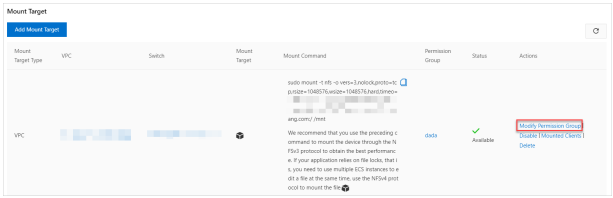
You must add a permission group to each mount target. You can modify the permission group of a mount target in the Apsara File Storage NAS console.

Prerequisites

- A file system is created. For more information, see Create a file system.
- A permission group and a rule are created. For more information, see Create a permission group and add rules.
- A mount target is created. For more information, see Add a mount target.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > File System List**.
3. Find the target file system, and click **Manage**.
4. Find the mount target that you want to modify and click **Modify Permission Group**.



5. In the **Modify Permission Group** dialog box, change the permission group and click **OK**.

7.1.6. Permission groups

7.1.6.1. View permission groups

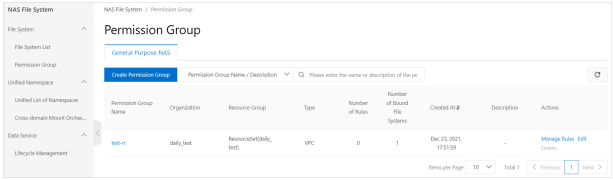
This topic describes how to view permission groups in the Apsara File Storage console.

Prerequisites

A permission group is created. For more information, see Create a permission group and add rules.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > Permission Group** and view permission groups in the region.



7.1.6.2. Delete a permission group

This topic describes how to delete a permission group in the Apsara File Storage NAS console.

Prerequisites

A permission group is created. For more information, see Create a permission group and add rules.

Operating system

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > Permission Group**.
3. Find the target permission group and click **Delete**.

   > **Note** Permission groups in use cannot be deleted. Before you can delete a permission group, you must remove the permission group from the linked mount target.

4. In the Delete Permission Group dialog box, click **OK**.

7.1.6.3. Manage permission group rules

This topic describes how to manage permission group rules in the Apsara File Storage NAS console. The management includes viewing the details of rules, modifying rules, and deleting rules.

Prerequisites

A permission group and a permission group rule are created. For more information, see Create a permission group and add rules.

Procedure

1. Log on to the Apsara File Storage NAS console.
2. Choose **NAS > Permission Group**.
3. Find the target permission group and click **Manage**.
4. On the Rules page, you can perform the following operations:
   - View all rules for the permission group.

     
   - Modify a rule. Find the target rule and click **Edit** to modify the details of the rule. The details include the **authorization address**, **read/write permissions**, **user permission**, and **priority**.
   - Delete a rule. Find the target rule and click **Delete**. In the Delete Rule dialog box, click **OK**.

7.1.7. Manage quotas

This topic describes how to use the Alibaba Cloud quota_tool tool to manage quotas on Elastic Compute Service (ECS) instances that have Apsara File Storage NAS file systems mounted. You can configure, view, and cancel quotas on these ECS instances.

Prerequisites

An NFS file system of the NAS Capacity or NAS Performance type is mounted on an ECS instance. For more information, see Mount an NFS file system.

Context

NAS allows you to view and manage directory-level quotas. Directory-level quotas specify the maximum number of files in each directory and the maximum storage space for these files.

From the perspective of the application scope, quotas are sorted into quotas for all users and quotas for a single user or group. Quotas for all users specify the maximum storage space for files that all users can create in a directory. Quotas for a single user or group specify the maximum storage space for files that a user or group can create in a directory.

From the perspective of the restriction level, quotas are sorted into statistical quotas and restriction quotas. Statistical quotas collect only the usage of storage space. You can query and view statistical data. Restriction quotas specify the maximum capacity of storage space for files that you can create in a directory. If the limit is exceeded, you may fail to create a file or subdirectory, append data to a file, or perform other operations.

Notice

- Only statistical quotas are available.
- NAS performs asynchronous calculation for quotas at the backend. When you use the quota_tool tool to query statistical data about quotas, the process requires a period of time to complete. In most cases, the time period is about 5 to 15 minutes.

Configure quotas

This topic uses the */mnt* directory as an example.

1. Log on to an Elastic Compute Service (ECS) instance by using a root account.

   You can use the quota_tool tool on an ECS instance that has a NAS file system mounted. You must run the tool with the root permissions. The following describes how to use the quota_tool tool on the ECS instance.

2. Use the following command to download the quota_tool tool.

   ```
   wget https://nasimport.oss-cn-shanghai.aliyuncs.com/quota_tool_v1.0 -O quota_tool
   ```

3. Use the following command to grant the execute permission to the quota_tool tool.

   ```
   sudo chmod a+x quota_tool
   ```

4. Configure quotas.

   Note For each file system, you can configure quotas only for a maximum of 10 directories.

   The syntax of the command that you use to configure quotas is `sudo ./quota_tool set --dir [DIR] [OPTION]`.

Parameter	Description
--dir [DIR]	Specifies the directory for which you want to configure quotas. For example, --dir /mnt/data/.

Parameter	Description
OPTION	Specifies the required options. Note When you specify options, you must follow these rules: 1. the --accounting option is required. 2. One of the --alluser, --uid, and --gid options is required. . ○ --accounting: specifies a statistical quota. ○ --alluser: specifies a directory-level quota for all users. ○ --uid: specifies the UID of a user. For example, --uid 505 indicates the quota is configured only for the user whose UID is 505. ○ --gid: specifies the GID of a group. For example, --gid 1000 indicates the quota is configured only for the group whose GID is 1000.

The following examples describe how to configure quotas.

- Use the following command to configure a statistical quota for the */mnt/data/* directory to limit the total number of files that reside in a directory.

```
sudo ./quota_tool set --dir /mnt/data/ --accounting --alluser
```

- Use the following command to configure a statistical quota for the */mnt/data/* directory to limit the total number of files that can be created by the user whose UID is 505.

```
sudo ./quota_tool set --dir /mnt/data/ --accounting --uid 505
```

Query quotas

After you configure a quota for an NAS directory, you can query statistical data about the quota for the directory.

1. Log on to an Elastic Compute Service (ECS) instance by using a root account.
2. Use the following command to query quotas.

```
sudo ./quota_tool get --dir /mnt/data/ --all
```

In the preceding command, the --all parameter is optional. If you specify the parameter, statistical data about all quotas that are configured for the file system returns.

Note

- The first time you query a quota, a state called Initializing appears. After the **Initializing** process is complete, you can query the quota and a result showing **success** appears. The duration of the initialization process is based on the number of files and subdirectories in a directory.
- After the initialization process is complete, you can query quotas daily. A delay of 5 to 10 minutes may occur before the expected FileCountReal and SizeReal appear. This occurs due to the asynchronous calculation for quotas at the backend.

The following table lists parameters that are included in a response in the JSON format.

Parameter	Description
Path	Indicates a directory for which you query a quota.
Report	Includes all information about a quota that is specified for a directory, for example, UID and GID.
ReportStatus	The state for the query of a quota.
FileCountLimit	Indicates the limit for the number of files. A value of Empty indicates no limit.
FileCountReal	Indicates the total number of files including subdirectories, files, and special files that reside in a directory.
QuotaType	Accounting indicates a statistical quota and Force indicates a restriction quota.
Uid	Indicates the UID of a user. A value of All indicates all users.
Gid	Indicates the GID of a group. A value of All indicates all groups.
SizeLimit	Indicates the maximum capacity of files that reside in a directory. A value of Empty indicates no limit.
SizeReal	Indicates the total capacity of files that reside in a directory.

Cancel quotas

You can cancel a quota.

1. Log on to an ECS instance.
2. Use the following command to cancel quotas.

   The syntax of the command that you can use to cancel quotas is `sudo ./quota_tool cancel --dir [DIR] [OPTION]`.

Parameter	Description
--dir [DIR]	Specifies the directory for which you want to cancel quotas, for example, -dir /mnt/data/.

Parameter	Description
OPTION	Specifies the required options. **Note** When you specify the OPTION parameter, one of the --alluser, --uid, and --gid options is required. ○ --alluser: specifies a directory-level quota for all users. ○ --uid: specifies the UID of a user. For example, --uid 505 indicates that the quota is canceled for the user whose UID is 505. ○ --gid: specifies the GID of a group. For example, --gid 505 indicates that the quota is canceled for the group whose GID is 505.

The following examples describes how to cancel quotas.

- If you have configured a quota for the */mnt/data/* directory, use the following command to cancel the quota for the user whose UID is 100.

```
sudo ./quota_tool cancel --dir /mnt/data/ --uid 100
```

- If you have configured a quota for the */mnt/data/* directory, use the following command to cancel the quota for all users.

```
sudo ./quota_tool cancel --dir /mnt/data/ --alluser
```

7.1.8. Unified namespace

This topic describes how to create a unified namespace and create a mount target for the unified namespace in the Apsara File Storage NAS console. The topic also describes how to add, remove, and modify file systems in a namespace, view namespace details, and enable the cross-domain mount orchestration feature.

Features

A unified namespace allows you to mount multiple file systems in a NAS cluster by using a single domain name. You do not need to maintain multiple mount targets and mount directories.

You can create a mount target for a unified namespace. You can use a unified namespace to manage multiple file systems the same way you manage a single file system.

A unified namespace contains a virtual root directory in which file systems are the first-level subdirectories. After you add a file system to a unified namespace, you can still mount the file system by using the mount targets of the file system.

Limits

A unified namespace has the following limits:

- You can add a maximum of 1,000 file systems to each unified namespace.
- The mapping name of a file system in a unified namespace cannot exceed 255 characters in length. The name can contain only letters, digits, and the following special characters:

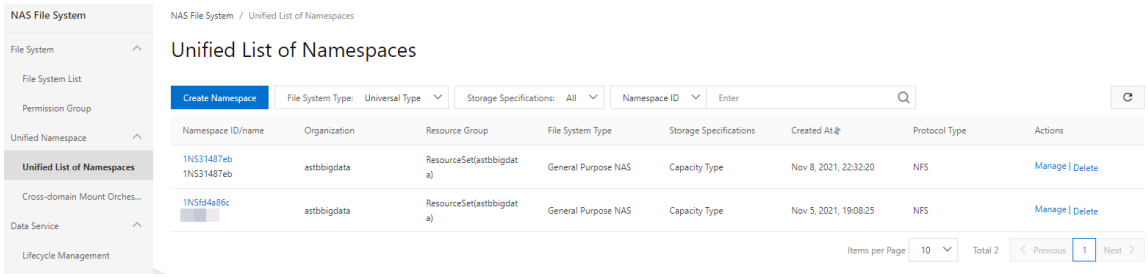
  .+-_()<>@#
- To enable a cross-domain mount orchestration, the mount directory name of a unified namespace cannot exceed 255 characters. The name can contain only letters, digits, and the following special characters:

  .+-_()<>@#
- You can create a maximum of two mount targets for each unified namespace.

- You can create a maximum of 20 namespaces in each region.
- You can mount a unified namespace only by using the NFSv3 protocol.
- The file systems that are added to a namespace must belong to the same Alibaba Cloud account and cluster as the namespace. The storage type, protocol type, and encryption type of the file systems must be the same.
- The mapping name of a file system must be unique in each unified namespace.
- File systems can be mapped only to first-level subdirectories in a unified namespace. You cannot modify the access permissions, owner, or access control lists (ACLs).

Basic features of a unified namespace

- Create a unified namespace and create a mount target for the unified namespace.
  i. Log on to the Apsara File Storage NAS console.
  ii. In the left-side navigation pane, choose **Unified Namespace > Unified List of Namespaces**.
  iii. On the **Unified List of Namespaces** page, click **Create Namespace**. You can then create a namespace and a mount target for the namespace as prompted.



> **Note** We recommend that you use different CIDR blocks if you create mount targets in virtual private clouds (VPCs) for unified namespaces in different regions. This identifies CIDR blocks when you mount unified namespaces across regions. For example, you can use `192.168.0.0/16` for Region 1 and `172.16.0.0/16` for Region 2. For more information, see Cross-domain mount orchestration.

- Add a file system to the unified namespace.

  After you create the unified namespace, you can add a file system and set the mapping name of the file system.

  > **Note** The mapping name is the name of the virtual directory for the file system.

- Remove the file system from the unified namespace.

  You can remove the existing file system from the unified namespace.

  > **Note** The file system is not deleted but removed from the file system list of the namespace.

- Modify the mapping name of the file system.

  You can modify the mapping name of the file system in the unified namespace.

  > **Note** If a symbolic or hard link exists between a file system and another file system, a connection failure may occur when you modify the mapping name of the file system.

- View the details of the unified namespace.

  The details of the namespace are divided into three sections:

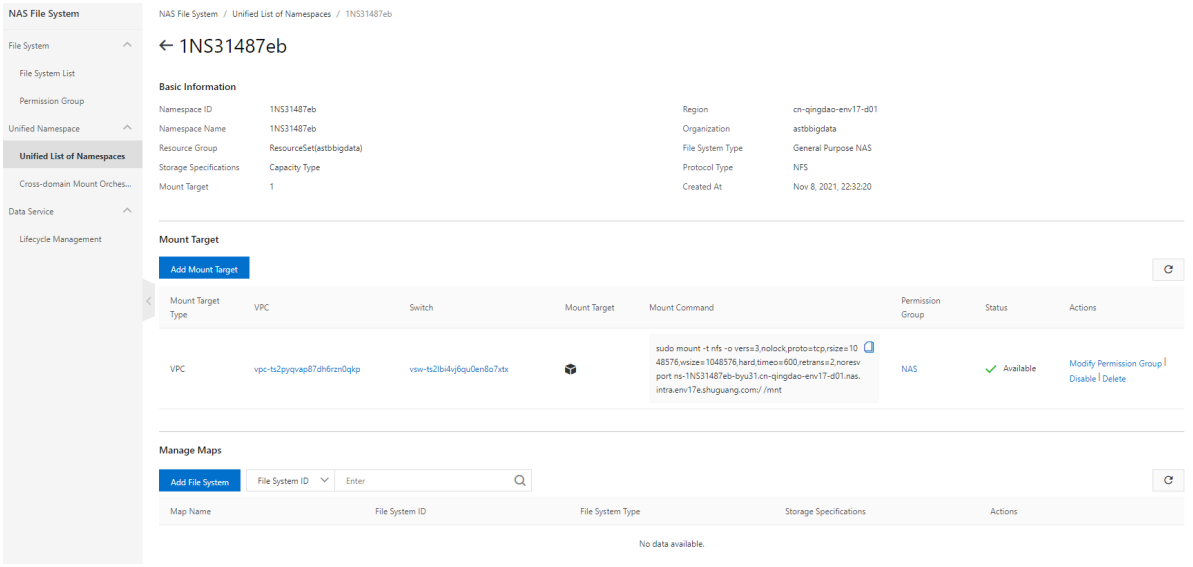
  - Properties

- Mount target list

  > **Note** You can create or delete mount targets.

- File system list

  > **Note** You can add or remove file systems.



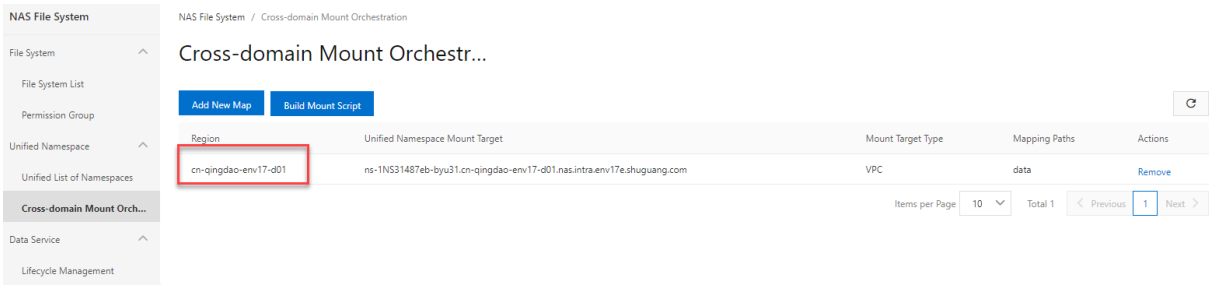
Cross-domain mount orchestration

In traditional solutions, you can add a file system to a namespace only if the file system and namespace reside in the same region. To add file systems to namespaces across regions, NAS provides the cross-domain mount orchestration feature. To use this feature, perform the following operations:

- Create a unified namespace and a mount target for the namespace.
- Map the unified namespace to the local directory tree of a client by using the cross-domain mount orchestration feature.
- After the orchestration is complete, specify the root directory to generate an automatic mount script.

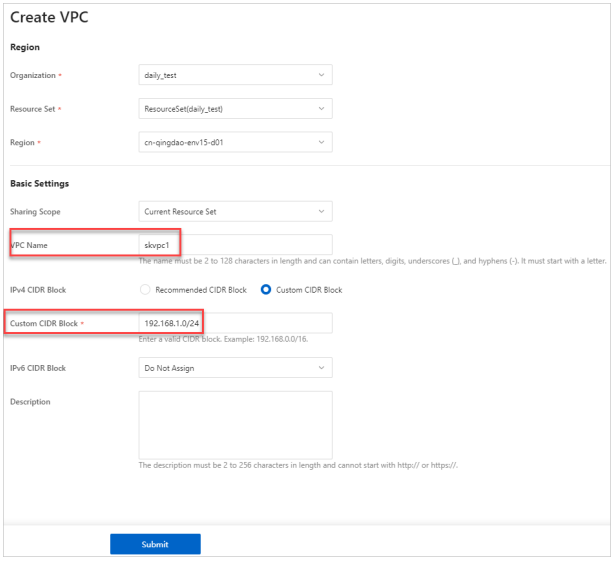
> **Notice** The specified mount target and mapping path cannot be modified after the map is created. You can remove the map. However, if you create the map again, the specified mount target can only be attached to the original mapping path.

To mount the namespace on a client, you can run the automatic mount script on the client. This allows the client to access file systems across regions. The format of the local path on the client for each unified namespace is `<Specified root directory>/<Mapping path of the namespace>`.



To enable a cross-domain mount orchestration for different VPCs that reside in different regions, you must establish VPC connections. The following procedure describes how to establish VPC connections and enable a cross-domain mount by using an example.

1. Create two VPCs.
   i. Log on to the Apsara File Storage NAS console.
   ii. In the left-side navigation pane, choose **Unified Namespace > Cross-domain Mount Orchestration**.
   iii. In the top navigation bar, choose **Products > Networking > Virtual Private Cloud**.
   iv. On the **Create VPC** page, create two VPCs. One VPC is for Region 1 and the other VPC is for Region 2.
   - Create a VPC named skvpc1 `192.168.1.0/24` for Region 1.
   - Create a VPC named skvpc2 `192.168.2.0/24` for Region 2.



2. Configure an Express Connect circuit across regions.

   Configure an Express Connect circuit between the VPCs of the two regions.

   Configure an Express Connect circuit in Region 1 to connect skvpc1 and skvpc2.

   i. Configure the route table for skvpc1.

   Add the CIDR block `192.168.2.0/24` of skvpc2 to the route table of skvpc1.

   a. In the left-side navigation pane, choose **VPCs > Route Tables**.
   b. On the **Route Tables** page, find the instance ID of skvpc1 and click **Manage** in the Actions column.
   c. On the Route Table page, click **Add Route Entry** and set the required parameters. Click **Create VPC-to-VPC Connection** to configure an Express Connect circuit between skvpc1 and skvpc2.

> **Note**
> - Specify the CIDR block of skvpc2 for **Destination CIDR Block**.
> - Select **Router Interface (To VPC)** from the **Next Hop Type** drop-down list.
> - If you configure an Express Connect circuit across regions for the first time, no VPCs are available.

ii. Create a VPC-to-VPC connection

Click Create VPC-to-VPC Connection to go to the **Create Peering Connection** page. Specify the source VPC ID, destination VPC ID, and bandwidth based on your business requirements.

After the VPC-to-VPC connection is created, you are redirected to the VPC-to-VPC page. If the initiator and acceptor are in the Activated state, the connection between skvpc1 and skvpc2 is established.

iii. View the VPC-to-VPC connection.

Return to the **Add Route Entry** page. Click the Refresh icon. The VPC-to-VPC connection that you have created appears in the VPC list.

Configure an Express Connect circuit in Region 2 to connect skvpc1 and skvpc2.

Perform the preceding procedure. In the Add Route Entry panel, select the VPC-to-VPC connection from the VPC list and click **OK**.

The route entry is then added to skvpc2 in Region 2. You can select the VPC-to-VPC connection from the VPC list because you have created a VPC-to-VPC connection. `vpc-6b xxxx42t` is the ID of skvpc1.

3. Add rules for NAS permission groups.

In the top navigation bar, choose **Products > Storage > Apsara File Storage NAS** . In the left-side navigation pane, choose **Permission Group**. On the Permission Group page, find the permission group for which you want to add rules, or create a permission group. Then, click **Add Rules**. In the dialog box that appears, set the authorized address and read and write permissions.

4. Creates a mount target.

In Region 2, you can create a mount target that resides in skvpc2 for the specified unified namespace.

In Region 1, you can create a mount target that resides in skvpc1 for the specified unified namespace.

5. Create an Elastic Compute Service (ECS) instance.

For example, if you select skvpc2 when you create an ECS instance, you can mount file systems on the ECS instance without the need to establish a VPC connection.

> **Note** In most cases, each ECS instance uses an independent VPC. You do not need to establish connections between VPCs that are used by mount targets of namespaces in two regions. However, you must establish connections between the VPC that is used by mount targets of the namespace and the VPC that is used by the ECS instance.

7.1.9. Lifecycle Management

This topic describes how to use the lifecycle management feature in the Apsara File Storage NAS console. The topic also describes how to configure lifecycle management policies and dump cold data to an Infrequent Access (IA) storage medium based on the policies. In the NAS console, you can create, view, and modify lifecycle management policies. You can also query the usage of General-purpose NAS storage and IA storage media.

Prerequisites

A Network File System (NFS) file system of the Capacity or Performance type is mounted on an Elastic Compute Service (ECS) instance. For more information, see Mount an NFS file system.

Context

The lifecycle management feature of NAS allows you to manage hot data and cold data in a tiered manner. You can configure lifecycle management policies and dump infrequently accessed data to an IA storage medium based on the policies to save your storage costs. You can still access the data in the IA storage medium the same way you access the data in a NAS file system.

Limits

The lifecycle management feature supports only NFS file systems. Server Message Block (SMB) file systems and file systems whose data is encrypted are not supported.

Usage notes

In Apsara Stack, the lifecycle management feature allows you to dump cold data from a NAS file system to a specified Object Storage Service (OSS) bucket. However, you must be the owner of the specified NAS file system and OSS bucket.

- You cannot delete the OSS bucket before you retrieve the cold data to the NAS file system. Otherwise, data loss may occur and the associated NAS cluster may become unavailable.
- You cannot revoke permissions that you have granted to NAS by using Resource Access Management (RAM).
- You must minimize the permissions on the OSS bucket to prevent data leaks.
- We recommend that you use an independent OSS bucket for the lifecycle management feature of NAS. This prevents cold data from being accidentally deleted if you store the cold data with other business data in the same OSS bucket.

Preparations

1. Authorize NAS by using RAM.

   To use the lifecycle management feature, you must grant access permissions on OSS to NAS. NAS can then read data from and write data to specified OSS buckets.

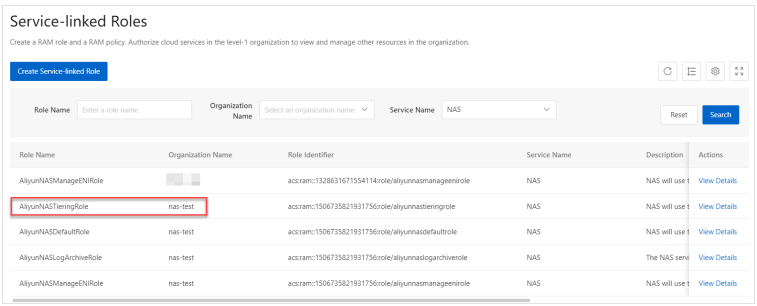
   > **Notice** When you create a RAM role, you must specify an organization where the file system resides. In this example, the specified organization is bms.
   >
   > You need to grant permissions to NAS only once for an organization.

   i. Log on to the Apsara Uni-manager Management Console.

   ii. In the top navigation bar, choose **Configurations > RAM Service Linked Role**.

   iii. On the **RAM Roles** page, click **Create RAM Role** to create a RAM role and grant access permissions on OSS to the role.

   iv. View the authorization status of bms in the role list to confirm that AliyunNASTieringRole is in the list.



2. Create an OSS bucket.

   You can use an existing OSS bucket or create an OSS bucket. NAS allows you to configure multiple OSS buckets for each file system.

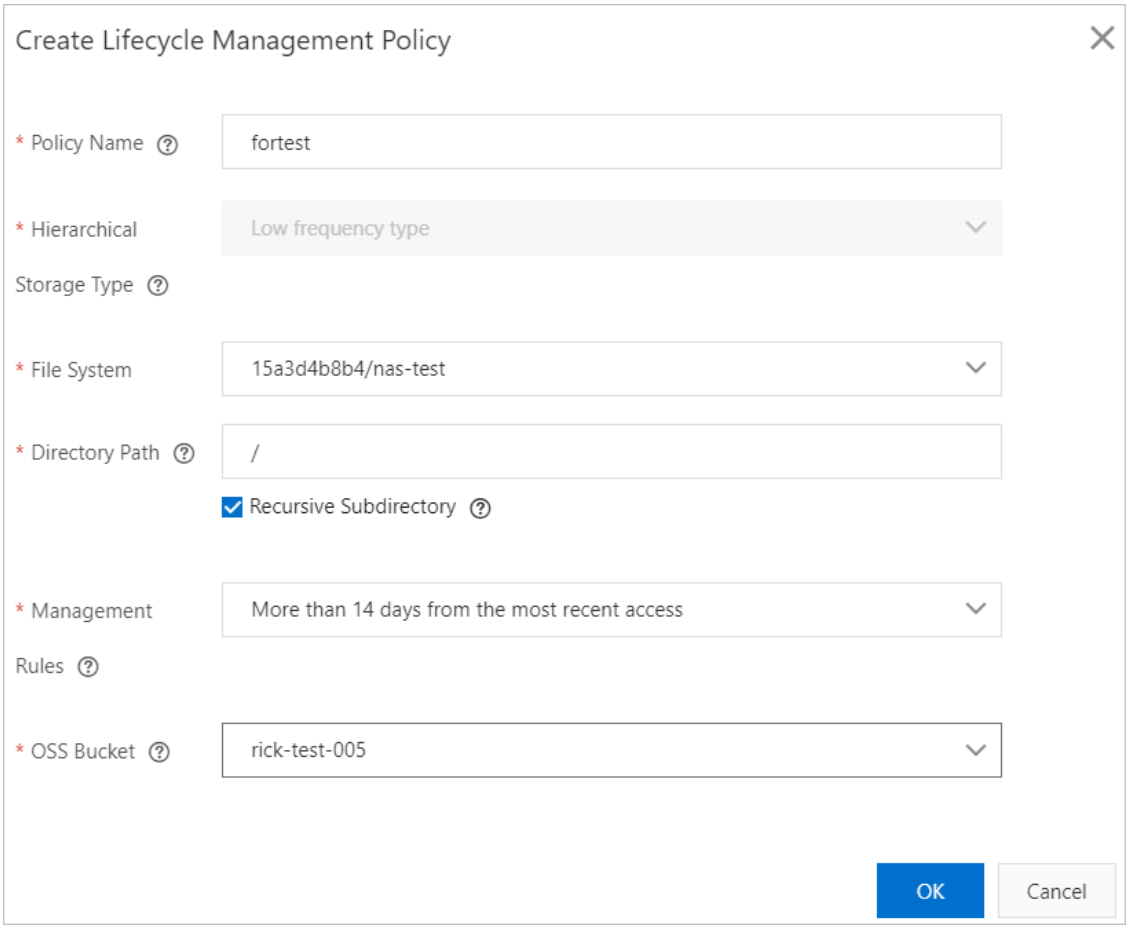
   > **Note** If you use an existing OSS bucket, the following requirements must be met:
   > - The OSS bucket is in the first cluster of the region. The domain name of the first cluster starts with oss- whereas the domain names of the other clusters start with oss*xxxx*.
   > - The OSS bucket and the file system belong to the same organization.

   Log on to the Apsara Uni-manager Operations console. In the top navigation bar, choose **Products > Object Storage Service** . In the left-side navigation pane, choose **+ > Create Bucket**. On the Create OSS Bucket page, set the parameters and create an OSS bucket that is used to store cold data. In this example, an OSS bucket named nastiering is created.

   
   > **Note** When you create an OSS bucket, the following requirements must be met:
   > - **Storage Class** is selected as **Standard** and the first cluster in the region is selected for the OSS cluster. The domain name of the first cluster starts with oss- whereas the domain names of the other clusters start with oss*xxxx*.
   > - The OSS bucket and the file system belong to the same organization.

Procedure

1. Create a lifecycle management policy.
   i. Log on to the Apsara Uni-manager Management Console.
   ii. In the top navigation bar, choose **Products > Apsara File Storage NAS**.
   iii. In the left-side navigation pane, click **Lifecycle Management**. On the page that appears, click Create Policy to create a lifecycle management policy.



After you create a lifecycle management policy for a directory in the file system, NAS dumps the cold data that meets the rule of the policy to the IA storage medium. When you create a lifecycle management policy, you can set the following parameters:

- Policy Name: the name of the policy. The name must be unique within different policies.
- File System: the file system for which the lifecycle management policy is configured.
- Directory Path: the directory path on the file system. The path must start with a forward slash (/).

  You can enter a forward slash (/) to indicate the root directory.

  If you select **Recursive Subdirectory**, all subdirectories in the directory are recurred.
- Management Rules: the pre-configured rules of the policy. You can select a rule to dump files that have not been accessed for more than 14, 30, 60, or 90 days to an IA storage medium.
- OSS Bucket: the OSS bucket to which cold data is dumped.

  > **Note** Cold data in a file system can be dumped to only one OSS bucket.
  >
  > Only the OSS buckets of the organization where the file system resides are displayed in the OSS Bucket list.

2. View the lifecycle management policy.

   On the **Lifecycle Management** page, you can view the lifecycle management policy that you have created. You can also filter the policies by file system ID.

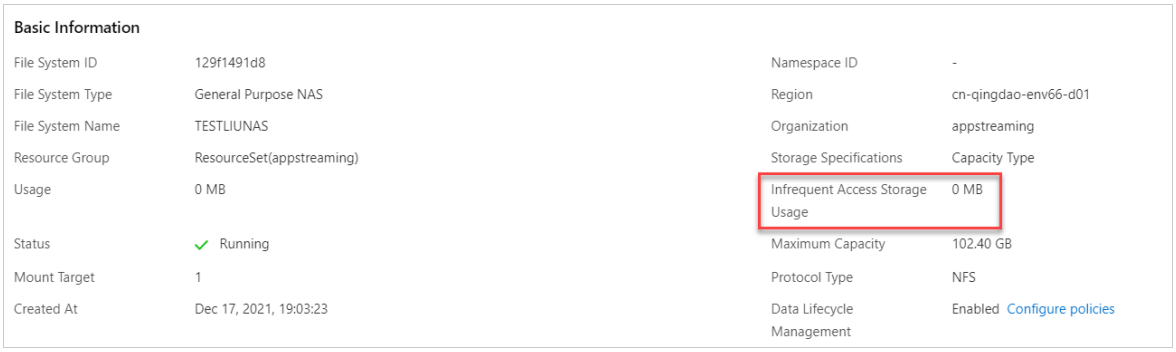
3. Modify the lifecycle management policy.

   On the **Lifecycle Management** page, you can modify the lifecycle management policy. You can modify the following parameters:

- Recursive Subdirectory
- Management Rules

4. Query the usage of the General-purpose NAS storage and IA storage medium.

   In the left-side navigation pane, click **File System List**. You can query the usage of General-purpose NAS storage and IA storage medium within the file system for which you have configured the lifecycle management policy.



7.1.10. Directory-level ACLs that grant the read and write access

7.1.10.1. Overview

Apsara File Storage NAS supports NFSv4 access control lists (ACLs) and Portable Operating System Interface (POSIX) ACLs. This topic describes POSIX ACLs and NFSv4 ACLs. It also lists precautions for using these ACLs.

Access control and user management are important for enterprise-level users who want to share files between different users and groups by using a shared file system. To control access to different files and directories, you can grant users and groups different types of access. NAS provides Network File System (NFS) ACLs to allow you to meet specific requirements. An ACL consists of one or more access control entries (ACEs) that each grant a user or group one or more permissions to access a file or directory.

The NFSv3 protocol includes the extended support for POSIX ACLs. POSIX ACLs extend the support for access control over file mode creation masks. You can grant permissions to specific users and groups besides users of the owner, group, and other classes. Permissions can also be inherited from parent objects. For more information, see acl - Linux man page.

The NFSv4 protocol includes extended support for NFSv4 ACLs that provide more fine-grained access control than POSIX ACLs do. For more information, see nfs4_acl - Linux man page.

You can mount an NFSv3 file system that has NFSv4 ACLs applied. These NFSv4 ACLs will then be converted into POSIX ACLs. You can also mount an NFSv4 file system that has POSIX ACLs applied. These POSIX ACLs will then be converted into NFSv4 ACLs. If you use NFS ACLs, we recommend that you mount NFSv4 file systems and control access by using NFSv4 ACLs rather than file mode creation masks or POSIX ACLs. This is because: NFSv4 ACLs and POSIX ACLs are not fully compatible. The interaction between ACLs and file mode creation masks is not in an ideal state. The file systems that are mounted by using the NFSv3 do not support locks. For more information about NFS ACL features, see Features.

Precautions for using POSIX ACLs

- We recommend that you use the default inheritance method that allows a subdirectory or file to inherit the same ACL from the parent directory. This allows you to avoid configuring another ACL when you create a new file or subdirectory in the parent directory.
- We recommend that you retain a minimum number of ACEs because a file system needs to scan all ACEs each time it performs permission verification. Abuse of ACLs may diminish the performance of file systems.

- Use caution when you configure ACLs by using the recursive method (`setfacl -R`). Large amounts of metadata are produced when you perform a recursive operation on a directory that contains a large number of files and subdirectories. This may affect your businesses.
- Before you configure ACLs, we recommend that you manage groups and related permissions. For example, you can add a user to one or more groups. If you want to add, remove, or modify permissions for a user, we recommend that you move the user to a group that has the required permissions. You do not need to modify the ACL of a group as long as the structure of groups remains unchanged. We recommend that you configure ACLs for groups rather than single users. This provides a simple and effective time-saving method to control access and ensure the better organization of permissions.
- You can apply a POSIX ACL to multiple objects that resides on different clients. In such cases, you must ensure that the ACL you apply to each object is the same. Apsara File Storage NAS stores user IDs (UIDs) and group IDs (GIDs) at the backend. You must ensure that the mappings between a username or group name and a UID or GID are the same.
- We recommend that you grant the least permissions to the other class because all users have the permissions that are granted to the other class. A potential security vulnerability may be exposed if the other class has more permissions than any ACE.
- We recommended that you configure the least permissions for the other class. Before creating files or directories, you can use the `umask 777` command to configure the file mode creation mask. This command sets the file mode creation mask to 000 when the mask is used as a parameter to create a new file or directory. This ensures that the newly created file or directory has the least permissions. For more information, see umask and the default file mode creation mask.
- After you enable POSIX ACLs, the semantics of the other class for the POSIX ACL are equal to the semantics of the EVERYONE@ principal. The semantics of the other class for the file mode creation mask are also equal to the semantics of the EVERYONE@ principal. When a system performs permission verification, the system treats the other class the same as the EVERYONE@ principal.

Precautions for using NFSv4 ACLs

- Use UIDs or GIDs such as UID 1001 to configure ACLs.
- We recommend that you do not configure the file mode creation mask after you configure an NFSv4 ACL.
- The `nfs4_setfacl` command provides -a, -x, -m, and other options. You can use these options to add, remove, or modify ACEs. However, we recommend that you use `nfs4_setfacl -e <file>` the command to edit an ACL in an interactive mode.
- We recommend that you configure the least permissions for the EVERYONE@ principal because NFSv4 ACLs only support allow rather than deny ACEs. A potential security vulnerability may be exposed if the EVERYONE@ principal has more permissions than other ACEs.
- NFSv4 ACLs have fine-grained permissions. In most cases, it is unnecessary to subdivide permissions at such a fine-grained level. For example, if you have the write access (w) to a file but do not have the append-only (a) access, an error may occur when you write data to the file. The same issue occurs for a directory. To avoid unexpected permission errors, we recommend that you specify a capital w (W) as a parameter when you use the `nfs4_setfacl` command to configure an ACL. The `nfs4_setfacl` command converts W to a full write access permission. For a file, W is expanded to wadT. For a directory, W is expanded to wadTD.
- We recommend that you use the default inheritance method that allows a subdirectory or file to inherit the same ACL from the parent directory. This allows you to avoid configuring another ACL when you create a new file or subdirectory in the parent directory.
- We recommend that you retain a minimum number of ACEs because a file system needs to scan all ACEs each time it performs permission verification. Abuse of ACLs may diminish the performance of file systems.
- Use caution when you configure ACLs by using the recursive method (`nfs4_setfacl -R`). Large amounts of metadata are generated when you perform a recursive operation on a directory that contains a large number of files and subdirectories. This may affect your businesses.
- Before you configure ACLs, we recommend that you manage groups and related permissions. For example, you can add a user to one or more groups. If you want to add, remove, or modify permissions for a user, we recommend that you move the user to a group that has the required permissions. You do not need to modify the

ACL of a group as long as the structure of groups remains unchanged. We recommend that you configure ACLs for groups rather than single users. This provides a simple and effective time-saving method to control access and ensure the better organization of permissions.

7.1.10.2. Features

This topic describes the features of NFSv4 access control lists (ACLs) and POSIX ACLs.

Features of Apsara File Storage NAS NFSv4 ACLs

- Only access control entries (ACEs) of the allow type are supported. ACEs of the following types are not supported: deny, audit, and alarm.

  Deny ACEs increase the complexity of access control. In most cases, complexity leads to confusion and increases potential security risks. As agreed by the industry, we recommend that you avoid using deny ACEs. For more information about why deny ACEs are not recommended, see FAQ.

  Audit and alarm ACEs are not available for NFS file systems. Instead, you can audit file systems and configure alerts based on auditing results in the NAS console.

- If no ACL is specified for a file or a directory, the default ACL that corresponds to the predefined file mode creation mask is applied.

  ```
  touch file
  ```

  ```
  [root@vbox test]# ls -l file
  -rw-r--r--. 1 root root 0 May  6 14:27 file
  ```

  ```
  [root@vbox test]# nfs4_getfacl file
  # file: file
  A::OWNER@:rwatTnNcCy
  A::GROUP@:rtncy
  A::EVERYONE@:rtncy
  ```

- An ACL is an ordered list that contains and deduplicates ACEs. This scheme ensures that permissions defined in an ACL are clear and informative.

  If you apply both a new ACE and an existing ACE to the same object and the existing ACE is inherited from the parent object, the permissions of the new ACE override the permissions of the existing ACE. For example:

  - In most cases, ACEs that include the following principals are queued in sequence at the beginning of an ACL: OWNER@, GROUP@, and EVERYONE@. These ACEs take precedence over other ACEs.

    ```
    [root@vbox test]# nfs4_getfacl file
    # file: file
    A::OWNER@:rwaxtTnNcCy
    A::GROUP@:rtncy
    A::EVERYONE@:rtncy
    A::1001:rwaxtTNcCy
    ```

  - Add an ACE of the read and write permissions to the following ACL for a user principal named 1009. The ACE is placed after the ACE that is defined for a user principal named 1001 based on the predefined order.

    ```
    [root@vbox test]# nfs4_setfacl -a A::1009:X file
    [root@vbox test]# nfs4_getfacl file
    # file: file
    A::OWNER@:rwaxtTcCy
    A::GROUP@:rwatcy
    A::EVERYONE@:tcy
    A::1001:rwaxtTNcCy
    A::1009:xtcy
    ```

- Add a new ACE that includes the execute permission to the ACL for the user principal named 1009. The system automatically merges the execute permission into the existing ACE for the 1009 user principal.

```
[root@vbox test]# nfs4_setfacl -a A::1009:W file
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxtTcCy
A::GROUP@:rwatcy
A::EVERYONE@:tcy
A::1001:rwaxtTNcCy
A::1009:waxtTncCy
```

- Add the f and d inheritance flags to an ACE that includes a user principal named 1009. Then, the system splits the ACE into two ACEs. One ACE has an extra inheritance flag named i specified, which indicates an inherit-only ACE. The other ACE only applies to the file object without inheritance flags. If the inheritance type of an existing ACE matches the type for one of the two ACEs, the system combines the existing ACE with the ACE out of the two ACEs. The two matching ACEs are combined into one ACE.

```
[root@vbox test]# nfs4_setfacl -a A:fd:1009:R file
[root@vbox test]# nfs4_getfacl file
# file: file
A::OWNER@:rwaxtTcCy
A::GROUP@:rwatcy
A::EVERYONE@:tcy
A::1001:rwaxtTNcCy
A::1009:rwaxtTNcCy
A:fdi:1009:r
```

- All ACEs can be inherited.
  i. For example, the OWNER@ principal has the write access, the GROUP@ principal has the read access, and the EVERYONE@ has no access to the dir directory.

```
[root@vbox nfs]# nfs4_getfacl dir
# file: dir
A::OWNER@:rwaDxtTnNcCy
A::GROUP@:rxtcy
A::EVERYONE@:tncy
```

  ii. Add an ACE that grants a user principal named 1000 the read, write, and execute access to the dir directory. The f and d inheritance flags are also specified for the ACE.

```
[root@vbox nfs]# nfs4_setfacl -a A:fd:1000:rwx dir
[root@vbox nfs]# nfs4_getfacl dir
# file: dir
A::OWNER@:rwaDxtTcCy
A::GROUP@:rxtcy
A::EVERYONE@:tcy
A::1000:rwx
A:fdi:1000:rwx
```

  iii. When you create a file or subdirectory in the dir directory, the file or the subdirectory automatically inherits all ACEs from the dir directory.

```
[root@vbox nfs]# touch dir/file
[root@vbox nfs]# nfs4_getfacl dir/file
# file: dir/file
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rwx
```

```
[root@vbox nfs]# mkdir dir/subdir
[root@vbox nfs]# nfs4_getfacl dir/subdir
# file: dir/subdir
A::OWNER@:rwaDxtTcCy
A::GROUP@:rwaDxtcy
A::EVERYONE@:rwaDxtcy
A:fdi:1000:rwx
```

Note

- We recommend that you grant the least privileges to the EVERYONE@ principal. Before you perform the following steps, we recommend that you run the `umask 777` command. This command ensures that no access to a file or directory is granted when the file or directory is created. For more information, see Why doesn't umask change execute permissions on files?
- When Linux calls functions to create files or directory, the predefined file mode creation mask is used as a request parameter. You can obtain the final ACL for a child object from the overlap of the inherited ACL (parent to child) and the file mode creation mask, as specified in the RFC7530 standard. When you modify the group bits of a file mode creation mask based on the standard, permissions included in an ACL for each group must be less than or equal to permissions defined in group bits. However, this scheme results in an invalid inheritance for groups. For example, you create a file and the file attempts to inherit A:RWX from a parent object. However, the predefined file mode creation mask sets the group bits to R. The final permission for the file becomes A:R. In actual practice, we recommend that you only modify file mode creation masks for ACLs that include the following principals: OWNER@, GROUP@, and EVERYONE@. This prevents against potential issues and ensures that semantics are clear. To remove permissions for a group, we recommend that you remove the ACE that relates to the group.

- You need to manage mappings between usernames or group names and user IDs (UIDs) or group IDs (GIDs) across multiple independent instances.

  NAS NFS adopts IP security groups rather than usernames to authenticate users. When you configure NFSv4 ACLs, UIDs or GIDs that are included in ACEs are stored in Linux. When you print an ACL for an object in a shell, Linux automatically loads the */etc/passwd* file and converts UIDs or GIDs into usernames or group names. You need to manage mappings between usernames or group names and UIDs or GIDs across multiple instances. You must ensure a username or group name is mapped to its UID or GID.

- NFSv4 ACLs can be printed by using extended attributes.

```
[root@vbox nfs]# getfattr -n system.nfs4_acl file
# file: file
system.nfs4_acl=0sAAAABgAAAAAAAAAAABYBhwAAAAZPV05FUkAAAAAAAAAAAAAAAABIAhwAAAAZHUk9VUEAAAAAAAAAAAAAAAA
BIAhwAAAAlFVkVSWU9ORUAAAAAAAAAAAAAAAAAAAAAEAAAAEMTAwMAAAAAAAAAALAAAAAwAAAAQxMDAwAAAAAAAAAEAAFgGQAAAA
BTEwMDAxAAAA
```

- Tools such as cp are supported for migrating NFSv4 ACLs.

  NAS allows you to migrate NFSv4 ACLs by using the cp, tar, and rsync tools. For more information, see How to preserve NFS v4 ACLs via extended attributes when copying file.

  The following `cp --preserve=xattr file1 file2` command makes a copy of the file1 file as the file2 file while making a copy of the ACL of the file1 file for the file2 file. The `cp -ar dir1 dir2` command makes a copy of the dir1 directory as the dir2 directory while making a copy of the ACL of the dir1 directory for the dir2 directory.

  Note You may fail to migrate NFSv4 ACLs if the version of the rsync tool is earlier than 3.1.2.

```
[root@vbox nfs]# nfs4_getfacl file1
# file: file1
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rtncy
[root@vbox nfs]# cp --preserve=xattr file1 file2
```

```
[root@vbox nfs]# nfs4_getfacl file2
# file: file2
A::OWNER@:rwatTcCy
A::GROUP@:rwatcy
A::EVERYONE@:rwatcy
A::1000:rtncy
[root@vbox nfs]# cp -ar dir1 dir2
```

- Interaction between NFSv4 ACLs and file mode creation masks is supported. The modification for the ACL of an object may change the file mode creation mask of the object. The modification for the file mode creation mask of an object may change the ACL of the object.

  For example, the file mode creation mask of the file object is 0666.

  ```
  [root@vbox nfs]# ls -l file
  -rw-rw-rw-. 1 root root 0 May  3  2019 file
  [root@vbox nfs]# nfs4_getfacl file
  # file: file
  A::OWNER@:rwatTcCy
  A::GROUP@:rwatcy
  A::EVERYONE@:rwatcy
  ```

  - If you add the execute permission to the file mode creation mask by modifying the owner bits, the execute permission is also added to the ACE that includes the OWNER@ principal.

    ```
    [root@vbox nfs]# chmod u+x file
    [root@vbox nfs]# ls -l file
    -rwxrw-rw-. 1 root root 0 May  3  2019 file
    [root@vbox nfs]# nfs4_getfacl file
    # file: file
    A::OWNER@:rwaxtTcCy
    A::GROUP@:rwatcy
    A::EVERYONE@:rwatcy
    ```

  - If you add the execute permission to an ACE that includes the GROUP@ principal, the execute permission is also added to the related file mode creation mask.

    ```
    [root@vbox nfs]# nfs4_setfacl -a A::GROUP@:x file
    [root@vbox nfs]# ls -l file
    -rwxrwxrw-. 1 root root 0 May  3  2019 file
    ```

> **Note**
> - In the interaction between ACLs and file mode creation masks, the EVERYONE@ principal is equal to the others class. When you modify the others class, the change also applies to the EVERYONE@ principal. This operation results in a slight impact on the semantics of permissions. For example, the current file mode creation mask is 177. After you run the `chmod o+r` command, all users that include the file owner and group members have the read permission. This occurs because the read permission is added to the related ACE that includes the EVERYONE@ principal. If no change is applied to the default file mode creation mask, the owner and group classes still have no read permission after you run the chmod o+r command.
> - If no change is applied to NFSv4 ACLs, the others class of the file mode creation mask keeps the same semantics. If an NFSv4 ACL is changed, the semantics of the others class change to the semantics of the EVERYONE@ principal and the latest semantics remain. We recommend that you do not use file mode creation masks after using NFSv4 ACLs.

- Interaction between NFSv4 ACLs and POSIX ACLs is supported.

  You can mount NFSv3 file systems that have NFSv4 ACLs applied. These NFSv4 ACLs will then be converted into POSIX ACLs. You can also mount NFSv4 file systems that have POSIX ACLs applied. These POSIX ACLs will then be converted into NFSv4 ACLs.

  > **Note** The semantics of POSIX ACLs are different from the semantics of NFSv4 ACLs. For example, the inheritance rules that apply to POSIX ACLs do not differentiate files and directories. NFSv4 ACLs have more permissions than POSIX ACLs, which have only read, write, and execute permissions. We recommend that you use either NFSv4 ACLs or POSIX ACLs to prevent against potential issues.

  For example, you configure an NFSv4 ACL for the dir0 directory. The permissions are listed as follows.

```
[root@vbox test] sudo nfs4_getfacl dir0
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:fdi:EVERYONE@:tncy
A:fdi:OWNER@:tTnNcCy
A:fdi:GROUP@:tncy
A:g:19064:rxtncy
A:g:19065:rwaDxtTnNcCy
A:fdig:19064:rxtncy
A:fdig:19065:rwaDxtTnNcCy
```

  You configure a POSIX ACL for the dir0 directory. The permissions are listed as follows.

```
[root@vbox test] sudo getfacl dir0
user::---
group::---
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
default:user::---
default:group::---
default:group:players:r-x
default:group:adminis:rwx
default:mask::rwx
default:other::---
```

  For example, you configure an NFSv4 ACL for the dir0/file file. The permissions are listed as follows.

```
[root@vbox test] sudo nfs4_getfacl dir0/file
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:g:19064:rxtncy
A:g:19065:rwaxtTnNcCy
```

For example, you configure a POSIX ACL for the dir0/file file. The permissions are listed as follows.

```
[root@vbox test] sudo getfacl dir0/file
user::---
group::---
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
```

- The number of NFSv4 ACLs is limited.

  NAS supports a maximum of 100,000 ACLs that are different from one another in each file system. Each ACL contains a maximum of 500 ACEs.

  > **Note** We recommend that you do not abuse ACLs and ACEs. This reduces the time and resources consumed for verifying permissions.

Features of NAS POSIX ACLs

- Permissions that are specified for the other class apply to all users.

  Everyone includes the owner, group, and users that are related to each ACE. The other class is equal to the EVERYONE@ principal of an NFSv4 ACL.

  > **Note** We recommend that you grant the least permissions to the other class in all cases.

  For example, the following ACL is configured for the *myfile* file. Although the ACE contains a user named alice who does not have the write permission, the write permission propagates to the ACE because the permission is specified for the other class.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:alice:r--
group::r--
mask::r--
other::rw-
```

- Permissions that are configured by ACLs will not be changed after you run the `chmod` command.

  > **Note** We recommend that you avoid modifying the file mode creation mask of a file that has a POSIX ACL applied. You can configure permissions for the file by modifying the POSIX ACL.

  i. For example, an ACE that grants the players group the read and write access to the *myfile* file.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::rw-
user:player:rw-
group::rw-
group:players:rw-
mask::rw-
other::---
```

ii. The `chmod g-w myfile` or `chmod u-w myfile` command does not change the permissions that are granted to the player user and the players group, which is different from the POSIX ACL standard. However, this ensures that permissions that are granted by POSIX ACLs to non-reserved users are the same after you modify permissions by using file mode creation masks. The non-reserved users include all users except for the users of the owner, group, and other classes.

```
[root@vbox 3]# getfacl myfile
# file: myfile
# owner: root
# group: root
user::r--
user:player:rw-
group::r--
group:players:rw-
mask::rw-
other::---
```

- If the execute permission is not granted to the group and other classes of an ACL, the ACL has no execute permission.

  The rule is predefined in Linux. The execute action is allowed by the backend of NAS. However, to make the execute permission in the ACL effective, you must grant the execute permission to the group or other class.

  For example, if the group and other classes do not have the execute access to the *myfile* file, the player user cannot execute the file.

  ```
  [root@vbox 3]# getfacl myfile
  # file: myfile
  # owner: root
  # group: root
  user::rw-
  user:player:r-x
  group::r--
  mask::r-x
  other::r--
  ```

  If you grant the execute permission to the group class, the execute permission also propagates to the player user.

  ```
  [root@vbox 3]# getfacl myfile
  # file: myfile
  # owner: root
  # group: root
  user::rw-
  user:player:r-x
  group::r-x
  mask::r-x
  other::r--
  ```

- If you configure inheritable NFSv4 ACLs for directories, these settings may not conform to the POSIX ACL

standard when these directories reside in NFSv3 file systems.

Inheritance rules that apply to files are different from those that apply to directories in NFSv4 ACLs. The same inheritance rules apply to both files and directories in POSIX ACLs.

> **Note** We recommend that you apply either NFS4 ACLs or POSIX ACLs to an NFS file system to prevent against potential issues.

- File mode creation masks cannot be modified.

  The file mode creation mask of a POSIX ACL is yielded by the combination and interaction of permissions from all users and groups. The mask has no practical meaning and cannot be changed.

- You need to manage mappings between usernames or group names and user IDs (UIDs) or group IDs (GIDs) across multiple instances.

  Apsara File Storage NAS NFS adopts IP security groups rather than usernames to authenticate users. When you configure POSIX ACLs, UIDs or GIDs that are included in ACEs are stored in Linux. When you print an ACL for an object in a shell, Linux automatically loads the */etc/passwd* file and converts UIDs or GIDs into actual usernames or group names. You need to manage mappings between usernames or group names and UIDs or GIDs across multiple instances. You must ensure a username or group name is mapped to its related UID or GID.

- POSIX ACLs can be printed by using extended attributes.

```
[root@vbox nfs]# getfattr -n system.posix_acl_access file
# file: file
system.posix_acl_access=0sAgAAAAEAAAD/////AgAFACAEAAAEAAAA/////xAABQD/////IAABAP////8=
```

- POSIX ACLs can be migrated by using tools such as cp.

  NAS allows you to migrate POSIX ACLs by using the cp, tar, and rsync tools. For more information, see How to preserve NFS v4 ACLs via extended attributes when copying file.

  The following `cp --preserve=xattr file1 file2` command makes a copy of the file1 file as the file2 file while making a copy of the ACL of the file1 file for the file2 file. The `cp -ar dir1 dir2` command makes a copy of the dir1 directory as the dir2 directory while making a copy of the ACL of the dir1 directory for the dir2 directory.

  > **Note** You may fail to migrate POSIX ACLs if the version of the rsync tool is earlier than 3.1.2.

```
[root@vbox nfs]# getfacl file1
user::---
user:player:r-x
group::---
mask::r-x
other::--x
[root@vbox nfs]# cp --preserve=xattr file1 file2
```

```
[root@vbox nfs]# getfacl file2
# file: file2
user::---
user:player:r-x
group::---
mask::r-x
other::--x
[root@vbox nfs]# cp -ar dir1 dir2
```

- The number of POSIX ACLs is limited.

  NAS supports a maximum of 100,000 ACLs that are different from one another in each file system. Each ACL contains a maximum of 500 ACEs.

> **Note** We recommend that you do not abuse ACLs and ACEs. This reduces the time and resources consumed for verifying permissions.

FAQ

Why are deny ACEs not supported?

- The position of an ACE that resides in an ACL is important.

  The sequence for ACEs that reside in an NFSv4 ACL is random. A deny ACE may be placed in any position of an NFSv4 ACL. For example, an ACL contains two ACEs: A::Alice:r and D::Alice:r. The position of the ACEs determines whether the user named Alice has the write permission.

  > **Note** When you configure an ACL, you must consider the position of each ACE.

- The number of ACEs in an ACL experiences a sharp increase.

  You may have difficulties to combine and deduplicate ACEs in an ACL because the sequencing for ACEs is not mandatory. The number of ACEs may increase up to tens or hundreds over a long period of time. To manage the final permissions that are produced by these ACEs, you need to check each ACE. The process to check is strenuous and time-consuming.

- The interactions between file mode creation masks and ACLs become more complex after deny ACEs are applied because deny features do not exist in file mode creation masks.
  - If deny ACEs are available, you may need to add several ACEs to an ACL when the file mode creation mask is changed. For example, if you change the file mode creation mask to -rw-rw-rw, you need to add the following ACEs to an ACL. You must add the ACEs in sequence at the beginning of the ACL.

    ```
    A::OWNER@:rw
    D::OWNER@:x
    A::GROUP@:rw
    D::GROUP@:x
    A::EVERYONE@:rw
    D::EVERYONE@:x
    ```

  - If deny ACEs are unavailable, you can sequence and deduplicate ACEs. You do not need to differentiate the EVERYONE@ principal and the other class. You can modify an ACL with ease when the file mode creation mask is changed. In such cases, you only need to find ACEs that contain the OWNER@, GROUP@, and EVERYONE@ principals and modify these ACEs as follows.

    ```
    A::OWNER@:rw
    A::GROUP@:rw
    A::EVERYONE@:rw
    ```

- Conversions between NFSv4 ACLs and POSIX ACLs are not supported in some cases.

  POSIX ACLs do not support deny ACEs. If deny ACEs are included in an NFSv4 ACL, you cannot convert the ACL into a POSIX ACL.

7.1.10.3. Use POSIX ACLs to control access

This topic describes how to configure Portable Operating System Interface (POSIX) access control lists (ACLs). You can use POSIX ACLs to control access to files and directories that reside in an NFSv3 file system.

Prerequisites

An NFSv3 file system is mounted. For more information, see Mount an NFS file system.

Commands

Before you configure POSIX ACLs, we recommend that you familiarize yourself with the related commands.

Command	Description
getfacl <filename>	Shows the ACL that applies to the specified file.
setfacl -m g::w <filename>	Grants the owing group the write access.
setfacl -m u:player:w <filename>	Grants the player user the write access.
setfacl -m g:players:rwx <filename>	Grants the players group the read, write, and execute access.
setfacl -x g:players <filename>	Removes permissions from the players group
getfacl file1 | setfacl --set-file=- file2	Copies the ACL for the *file1* file to the *file2* file.
setfacl -b file1	Removes all extended ACEs from the *file1* file. The base ACEs of the owner, group, and others are retained.
setfacl -k file1	Removes all default ACEs from the *file1* file.
nfs4_setfacl -R -m g:players:rw dir	Grants the players group the read and write access to files and subdirectories in the *dir* directory.
setfacl -d -m g:players:rw dir1	Grants the players group the read and write access to the newly created files and subdirectories in the *dir1* directory.

Procedure

To control access to files and directories by configuring NFS ACLs, follow these steps.

1. Create users and groups.

   In this example, the following users are created: player, admini, and anonym. The following groups are created: players and adminis. The player user is added to the players group and the admini user is added to the adminis group.

   ```
   sudo useradd player
   sudo groupadd players
   sudo usermod -g players player
   sudo useradd admini
   sudo groupadd adminis
   sudo usermod -g adminis admini
   sudo useradd anonym
   ```

2. Configure POSIX ACLs to control access to files and directories.

   Use the following commands to complete the operations: create a directory named *dir0* and grant the players group the read-only access, the adminis group the read, write, and execute permissions, and the others class no access to all the files in the *dir0* directory.

```
sudo umask 777
sudo mkdir dir0
sudo setfacl -m g:players:r-x dir0
sudo setfacl -m g:adminis:rwx dir0
sudo setfacl -m u::--- dir0
sudo setfacl -m g::--x dir0
sudo setfacl -m o::--- dir0
sudo setfacl -d -m g:players:r-x dir0
sudo setfacl -d -m g:adminis:rwx dir0
sudo setfacl -d -m u::--- dir0
sudo setfacl -d -m g::--x dir0
sudo setfacl -d -m o::--- dir0
```

Use the `sudo getfacl dir0` command to verify the result after the configuration is complete.

```
# file: dir0
# owner: root
# group: root
user::---
group::--x
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
default:user::---
default:group::--x
default:group:players:r-x
default:group:adminis:rwx
default:mask::rwx
default:other::---
```

3. Verify the ACL configuration.
   i. Verify that the admini user has read and write access to the dir0/file file.

```
[root@vbox test] sudo su admini -c 'touch dir0/file'
[root@vbox test] sudo su admini -c 'echo 123 > dir0/file'
```

   ii. Use the following command to verify the read-only access of the player user.

```
[root@vbox test] sudo su player -c 'touch dir0/file'
touch: cannot touch ‘dir0/file’: Permission denied
[root@vbox test] sudo su player -c 'cat dir0/file'
123
[root@vbox test] sudo su player -c 'echo 456 >> dir0/file'
bash: dir0/file: Permission denied
[root@vbox test] sudo su player -c 'getfacl dir0/file'
# file: dir0/file
# owner: admini
# group: adminis
user::---
group::---
group:players:r-x
group:adminis:rwx
mask::rwx
other::---
```

iii. Verify that the anonym user does not have access to the dir0/file file.

```
[root@vbox test] sudo su anonym -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su anonym -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su anonym -c 'getfacl dir0/file'
getfacl: dir0/file: Permission denied
```

Related operations

If you want to remove user permissions, use the following method.

When you use NFSv4 ACLs, we recommend that you sort each user into different groups. This allows you to configure permissions for a group rather than a separate user. To disable access to an object from a user, you can remove the user from a group that has access to the object. For example, the following commands remove the admini user from the adminis group and add the user to the adminis2 group.

```
[root@vbox test] sudo groupadd adminis2
[root@vbox test] sudo usermod -g adminis2 admini
[root@vbox test] id admini
uid=1057(admini) gid=1057(admini) groups=1061(adminis2)
[root@vbox test] sudo su admini -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su admini -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su admini -c 'getfacl dir0/file'
getfacl: dir0/file: Permission denied
```

7.1.10.4. Use NFSv4 ACLs to control access

This topic describes how to configure NFSv4 access control lists (ACLs) and apply these ACLs to NFSv4 file systems to control access to files or directories in the file systems.

Prerequisites

An NFSv4 file system is mounted. For more information, see Mount an NFS file system.

Context

You can mount an NFSv4 file system on a Linux Elastic Compute Service (ECS) instance and install the Linux-specific nfs4-acl-tools tool on the instance. After the tool is installed, you can use the standard nfs4_getfacl and nfs4_setfacl tools to configure NFSv4 ACLs.

Commands

Before you configure NFSv4 ACLs, we recommend that you get familiar with the related commands.

Command	Description
`nfs4_getfacl <filename>`	Views the access permissions for a specified file.
`nfs4_setfacl -a A::GROUP@:W <filename>`	Adds an access control entry (ACE) that grants the write permissions on a specified file to the GROUP@ principal.
`nfs4_setfacl -a A::1000:W <filename>`	Adds an ACE that grants the write permissions on a specified file to a user principal named 1000.
`nfs4_setfacl -a A:g:10001:W <filename>`	Adds an ACE that grants the write permissions on a specified file to a user principal named 10001.

Command	Description
`nfs4_setfacl -e <filename>`	Edits an ACL in an interactive mode.
`nfs4_getfacl <filename> > saved_acl.txt`	Saves a list of permissions for a specified file as a TXT file.
`nfs4_setfacl -S saved_acl.txt <filename>`	Configures permissions for a specified file by using a TXT file that includes a list of permissions.
`nfs4_setfacl -m A::1001:rwaxTNcCy A::1001:rxtcy file1`	Modifies the permission of an ACE that applies to the *file1* file.
`nfs4_getfacl file1 | nfs4_setfacl -S - file2`	Copies the permissions for the *file1* file to the *file2* file.
`nfs4_getfacl file1 | grep @ | nfs4_setfacl -S - file1`	Deletes all ACEs that apply to the *file1* file except for ACEs that include the following principals: OWNER@, GROUP@, and EVERYONE@.
`nfs4_setfacl -R -a A:g:10001:rW dir`	Adds an ACE that grants the read and write permissions on files and subdirectories in the *dir* directory to a group principal named 10001.
`find dir -type f -exec sh -c 'for ace in $(nfs4_getfacl \{} | grep "^A.*\:1005\:"); do nfs4_setfacl -x $ace \{}; done' \;`	Deletes ACEs that grant a user principal named 1005 access to files in the *dir* directory.
`nfs4_setfacl -a A:fdg:10001:rW dir1`	Adds an ACE that grants the read and write permissions on new files and subdirectories in the *dir1* directory to a group principal named 10001.
`nfs4_setfacl -a A:fg:10001:rx dir1`	Adds an ACE that grants the read, write, and execute permissions on all newly created files in the *dir1* directory to a group principal named 10001.

Procedure

To control access to files or directories by configuring NFSv4 ACLs, perform the following steps.

1. Create users and groups.

   In this example, the following users are created: player, admini, and anonym. The following groups are created: players and adminis. The player user is added to the players group and the admini user is added to the adminis group.

   ```
   sudo useradd player
   sudo groupadd players
   sudo usermod -g players player
   sudo useradd admini
   sudo groupadd adminis
   sudo usermod -g adminis admini
   sudo useradd anonym
   ```

2. Install the related tools to configure NFSv4 ACLs.

   If you have installed these tools, skip this step.

   ```
   sudo yum -y install nfs4-acl-tools
   ```

3. Obtain the group IDs of the players and adminis groups.

Open the */etc/group* file. The group IDs of the players and adminis groups are displayed.

```
players:x:19064:player
adminis:x:19065:admini
```

4. Configure NFSv4 ACLs for files and directories.

   Run the following commands to complete the operations: create a directory named *dir0* and add ACEs that grant the read-only permissions on all files in the *dir0* directory to the players group, grant the read, write, and execute permissions to the adminis group, and do not grant permissions to other users.

```
sudo umask 777
sudo mkdir dir0
sudo nfs4_setfacl -a A:fdg:19064:RX dir0
sudo nfs4_setfacl -a A:fdg:19065:RWX dir0
sudo nfs4_setfacl -a A:fdg:OWNER@: dir0
sudo nfs4_setfacl -a A:fdg:GROUP@: dir0
sudo nfs4_setfacl -a A:fdg:EVERYONE@: dir0
```

   Run the `sudo nfs4_getfacl dir0` command to verify the configuration.

```
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:fdi:EVERYONE@:tncy
A:fdi:OWNER@:tTnNcCy
A:fdi:GROUP@:tncy
A:g:19064:rxtncy
A:g:19065:rwaDxtTnNcCy
A:fdig:19064:rxtncy
A:fdig:19065:rwaDxtTnNcCy
```

5. Verify the configuration of the ACL.

   i. Run the following commands to verify that the admini user has the read and write permissions.

```
[root@vbox test] sudo su admini -c 'touch dir0/file'
[root@vbox test] sudo su admini -c 'echo 123 > dir0/file'
```

   ii. Run the following command to verify that the player user has the read-only permissions.

```
[root@vbox test] sudo su player -c 'touch dir0/file'
touch: cannot touch ‘dir0/file’: Permission denied
[root@vbox test] sudo su player -c 'echo 456 >> dir0/file'
bash: dir0/file: Permission denied
[root@vbox test] sudo su player -c 'cat dir0/file'
123
[root@vbox test] sudo su player -c 'nfs4_getfacl dir0/file'
A::OWNER@:tTnNcCy
A::GROUP@:tncy
A::EVERYONE@:tncy
A:g:19064:rxtncy
A:g:19065:rwaxtTnNcCy
```

iii. Run the following command to verify that the anonym user does not have permissions on the /dir0/file file.

```
[root@vbox test] sudo su anonym -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su anonym -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su anonym -c 'nfs4_getfacl dir0/file'
Invalid filename: di
```

What to do next

If you want to remove user permissions, use the following method.

When you use NFSv4 ACLs, we recommend that you sort each user into different groups. This allows you to configure permissions for a group rather than a separate user. To disable access to an object from a user, you can remove the user from a group that has access to the object. For example, use the following commands to remove the admini user from the adminis group and add the user to the adminis2 group:

```
[root@vbox test] sudo groupadd adminis2
[root@vbox test] sudo usermod -g adminis2 admini
[root@vbox test] id admini
uid=1057(admini) gid=1057(admini) groups=1054(adminis2)
[root@vbox test] sudo su admini -c 'ls dir0'
ls: cannot open directory dir0: Permission denied
[root@vbox test] sudo su admini -c 'cat dir0/file'
cat: dir0/file: Permission denied
[root@vbox test] sudo su admini -c 'nfs4_getfacl dir0/file'
Invalid filename: dir0/file
```

8.Tablestore

8.1. User Guide

8.1.1. What is Tablestore?

Tablestore is a NoSQL database service independently developed by Alibaba Cloud. Tablestore is a proprietary software program that is certified by the relevant authorities in China. Tablestore is built on the Apsara system of Alibaba Cloud, and can store large amounts of structured data and allow real-time access to these data.

Tablestore provides the following features:

- Offers schema-free data storage. You do not need to define attribute columns before you use them. Table-level changes are not required to add or delete attribute columns. You can configure the time to live (TTL) parameter for a table to manage the lifecycle of data. The expired data is deleted from the table.
- Adopts the triplicate technology to keep three copies of data on three servers across three different racks. A cluster can support single storage type instances (SSD only) or mixed storage type instances (SSD and HDD) to meet different budget and performance requirements.
- Adopts a fully redundant architecture that prevents single points of failure (SPOFs). Tablestore supports smooth online upgrades, hot cluster upgrades, and automatic data migration, which enable you to dynamically add or remove nodes for maintenance without incurring service interruptions. The concurrent read and write throughput and storage capacity can be linearly scaled. Each cluster can have at least 500 hosts.
- Supports highly concurrent read and write operations. Concurrent read and write capabilities can be scaled out as the number of hosts increases. The read and write performance is indirectly related to the amount of data in a single table.
- Supports identity authentication and multi-tenancy. Comprehensive access control and isolation mechanisms are provided to safeguard your data. VPC and access over HTTPS are supported. Provides multiple authentication and authorization mechanisms so that you can define access permissions on individual tables and operations.

8.1.2. Precautions

Before you use Tablestore, you need to take note of the following precautions and limits.

The following table describes the limits for Tablestore. A part of the limits indicate the maximum allowable values rather than the suggested values. To ensure better performance, set the table scheme and data size in a single row based on actual conditions, and adjust the following configurations.

Item	Limit	Description
The number of instances under an Apsara Stack tenant account	1024	To raise the limit, contact the technical support personnel.
The number of tables in an instance	1024	To raise the limit, contact the technical support personnel.
The length of an instance name	3 to 16 bytes	The instance name can contain uppercase and lowercase letters, digits, and hyphens (-). It must start with a letter and cannot end with a hyphen (-).
The length of a table name	1 to 255 bytes	The table name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).

Item	Limit	Description
The length of a column name	1 to 255 bytes	The column name can contain uppercase and lowercase letters, digits, and underscores (_). It must start with a letter or underscore (_).
The number of columns in a primary key	1 to 4	A primary key can contain one to four primary key columns.
The size of the value in a string type primary key column	1 KB	The size of the value in a STRING primary key column cannot exceed 1 KB.
The size of the value in a STRING attribute column	2 MB	The size of the value in a STRING attribute column cannot exceed 2 MB.
The size of the value in a BINARY primary key column	1 KB	The size of the value in a BINARY primary key column cannot exceed 1 KB.
The size of the value in a BINARY attribute column	2 MB	The size of the value in a BINARY attribute column cannot exceed 2 MB.
The number of attribute columns in a single row	Unlimited	A single row can contain an unlimited number of attribute columns.
The number of attribute columns written by one request	1,024	During a PutRow, UpdateRow, or BatchWriteRow operation, the number of attribute columns written in a row cannot exceed 1,024.
The data size of a row	Unlimited	The total size of all column names and column values for a row is unlimited.

8.1.3. Quick start

8.1.3.1. Log on to the Tablestore console

This topic shows how to log on to the Tablestore console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.
5. In the top navigation bar, choose **Products > Tablestore**.

8.1.3.2. Create an instance

An instance is a logical entity in Tablestore and is used to manage tables. An instance is the basic unit of the resource management system of Tablestore. Tablestore controls application access and implements resource measurement at the instance level. This topic describes how to create an instance.

Procedure

1. Log on to the Tablestore console.
2. On the **Overview** tab, click **Create Instance**.

   > **Note** You can create different instances to manage the associated tables for different business, or create different instances for development, testing, and production environments of the same business. By default, Tablestore allows you to create up to 1,024 instances and up to 1,024 tables in each instance that belongs to an Apsara Stack tenant account.
3. On the **Create Instance** page, configure parameters.

Parameter	Description
Region	Select a region from the drop-down list for the instance.
Organization	Select an organization from the drop-down list for the instance.
Resource Set	Select a resource set from the drop-down list for the instance.

Parameter	Description
Instance Name	Enter a name for the instance. Instance naming conventions: The name must be 3 to 16 characters in length and can contain only letters, digits, and hyphens (-). It must start with a letter and cannot start with case-insensitive string `ali` or `ots`.
Description	Enter a description for the instance.
Instance Type	Select an instance type from the drop-down list for the instance. Tablestore provides high-performance instances and capacity instances. The instance types vary based on the type of cluster you deploy.

4. Click **Submit**.
5. In the **Submitted.** dialog box, click **Back to Console**.

   On the **Overview** tab, you can view the created instance.

   After the instance is created, you can perform the following operations on the instance:

   - Click the name of the instance or click Manage Instance in the **Actions** column that corresponds to the instance. On the **Instance Management** page, click each tab to perform various operations.
     - On the **Instance Details** tab, you can view the Instance Access URL, Basic Information, and Tables sections.
     - On the **Instance Monitoring** tab, you can view monitoring data by using time ranges, metric categories, and operations.
     - On the **Network Management** tab, you can bind or unbind virtual private clouds (VPCs) and view the list of VPCs.
   - Click **Release** in the **Actions** column to release an instance.

     Notice
     - Before you release an instance, ensure that all tables are deleted, and VPCs are unbound from instances.
     - To create an instance when you release an existing instance, ensure that the name of the instance you want to create is different from that of the existing instance to avoid conflicts.

8.1.3.3. Create tables

This topic describes how to create a table in the Tablestore console.

Procedure

1.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. On the **Instance Details** tab, click **Create Table**.

   Note You can create a maximum of 1,024 tables in each instance.

4. In the **Create Table** dialog box, set **Table Name** and **Primary Key**.

   The following table describes the parameters you can configure.

Parameter	Description
Table Name	The name of the table. This name is used to uniquely identify a table in an instance. The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or an underscore (_).
Primary Key	One or more primary key columns in the table that uniquely identify each record in the table. Enter a primary key name and select a data type. Click **Add a Primary Key** to add a primary key column. You can add one to four primary key columns. By default, the first primary key column is the partition key. The configurations and order of primary key columns cannot be modified after the table is created. **Note** ◦ In Tablestore, only a primary key column can be used as an auto-increment primary key column. Partition keys cannot be used as auto-increment primary key columns. ◦ After a primary key column is set to an auto-increment primary key column, Tablestore automatically generates a value for the auto-increment primary key column when you write a row of data. You do not need to specify a value for the auto-increment primary key column. The values of auto-increment primary key columns are incremental and unique within the rows that share the same partition key. ◦ Naming conventions of primary key columns: The name must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_) ◦ Data types supported by primary key columns are **String**, **Integer**, and **Binary**.

5. Optional. Configure advanced parameters.

   If you need to configure parameters such as Time to Live and Max Versions, perform this operation.

   i. Turn on **Advanced Settings**.

ii. Configure advanced parameters.

The following table describes the advanced parameters you can configure.

Parameter	Description
Time to Live	The period for which data in the table can be retained. When the retention period exceeds the Time to Live (TTL) value, the system deletes the expired data. The minimum TTL value is 86,400 seconds (one day). A value of -1 indicates that data never expires.
Max Versions	The maximum number of versions of data that can be retained for an attribute column. When the versions of data in an attribute column exceed the Max Versions value, the system deletes the earliest versions of data to keep the maximum number of versions equal to the Max Versions value. Valid values: 1 to 10.
Max Version Offset	The difference between the version number and the data written time must be within the value of Max Version Offset. Otherwise, an error occurs when the data is written. Unit: seconds. The valid version range for attribute columns is calculated based on the following formula: Valid version range = **[Data written time - Max version offset value, Data written time + Max version offset value)**.
Reserved Read Throughput	You can set this parameter only for high-performance instances. The read and write throughput that is allocated and reserved for the table. Valid values: integers from 0 to 5000. When the specified reserved read and write throughput is **0**, Tablestore does not reserve related resources for the table.
Reserved Write Throughput	

6. Optional. Create secondary indexes.

If you need to create secondary indexes, perform this operation.

i. Turn on **Create Secondary Index**.

ii. Click the **+ Add** button in the Pre-defined Column section. Enter the name of the pre-defined column and select a data type from the drop-down list.

- This operation is performed to create a predefined column for the base table. Tablestore uses a schema-free model. You can write an unlimited number of columns to a row and do not need to specify a fixed number of predefined columns in a schema. When you create a table, you can also predefine columns and specify their data types.
- You can add up to 14 predefined columns. To deleted the predefined column you add, click the icon on the left of the corresponding predefined column.
- The name of a predefined column must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
- The data types of predefined columns include STRING, INTEGER, BINARY, FLOAT, and BOOLEAN.

iii. Click **Add Secondary Index**. Enter Index Name and set Primary Key and Pre-defined Column for the index table.

- The name of an index table must be 1 to 255 bytes in length and can contain letters, digits, and underscores (_). The name must start with a letter or underscore (_).
- You can set the primary key of the index table to the primary key or predefined columns of the base table.
- Pre-defined Column is optional. You can set the predefined columns of the index table to only the predefined columns of the base table.

7. Click **OK**.

After a table is created, you can view the table in the **Table List** section. If the created table is not displayed in the list of tables, click the icon to refresh the list of tables.

After a table is created, you can perform the following operations on the table:

- Click the name of the table or click Details in the Actions column. On the **Manage Table** page, you can perform the following operations:
  - On the **Details** tab, you can view the description of the table and the primary key columns list, and modify the attributes of the table.
  - On the **Data Editor** tab, you can insert or update data, query data, view data details, and delete multiple data at a time.
- Click the icon in the Actions column corresponding to a table and choose **Delete** from the shortcut menu. Click OK in the Delete Table dialog box. The table is deleted.

> **Notice** If you delete a table, the table and the data in the table are permanently deleted from Tablestore and cannot be recovered. Exercise caution when you perform this operation.

8.1.3.4. Read and write data in the console

After a data table is created, you can use the Tablestore console to perform read and write operations on the data in the data table.

Write data

1.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of the required table, and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column corresponding to the table.
4. On the **Data Editor** tab, click **Insert**.
5. In the **Insert** dialog box, set Primary Key Value. Click **Add Column**. Set **Name**, **Type**, **Value**, and **Version**.

   By default, **System Time** is selected, which indicates that the current system time is used as the version number of the data. You can also clear **System Time** and enter the version number of the data.
6. Click **OK**.

   Rows that contain the written data are displayed on the **Query** tab.

Update data

You can update data in the attribute columns of a row.

1.

2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of the required table, and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column corresponding to the table.
4. On the **Query** tab, select the row that you want to update. Click **Update**.
5. In the **Update** dialog box, modify the type and value of a primary key column, add or remove attribute columns, or update or delete data from attribute columns.
   - You can click **Add Column** to add an attribute column. You can also click the icon to delete an attribute column.
   - In the first Actions column, if you select **Update**, you can modify data in attribute columns. If you select **Delete**, you can delete data of the selected version. If you select **Delete All**, you can delete all versions of the data.
6. Click **OK**.

Query data

In the Tablestore console, you can query data in a single row (GetRow) or data within a specified range (RangeQuery).

To query data in a single row, perform the following operations:

1.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of the required table, and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column corresponding to the table.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.
   i. In the **Search** dialog box, set Modes to **GetRow**.
   ii. By default, the system returns all columns. To return specific attribute columns, disable **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).
   iii. Set **Primary Key Columns**.
   The integrity and accuracy of the primary key values affect the query results.
   iv. Set **Max Versions** to specify the maximum number of versions to return.

   > **Note** You can specify a maximum of 20 versions in the console. This limit does not apply when you use Tablestore SDKs.
6. Click **OK**.
   Data that meets the filter conditions is displayed on the **Data Editor** tab.

To query data within a specified range, perform the following steps:

1.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of the required table, and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column corresponding to the table.
4. On the **Data Editor** tab, click **Search**.
5. Set filter conditions.

i. In the **Search** dialog box, set Modes to **Range Search**.

ii. By default, the system returns all columns. To return specific attribute columns, disable **All Columns**. Enter the names of the attribute columns to return. Separate the names of the attribute columns with commas (,).

iii. Set Start Primary Key Column and End Primary Key Column.

You can set Start Primary Key Column to **Min Value** or **Custom** and End Primary Key Column to **Max Value** or **Custom**. If you select **Custom**, enter a custom value.

> **Note**
> - The value in the first primary key column takes priority when the range query mode is used. When the start primary key column value and the end primary key column value are the same in the first primary key column, the system uses the value in the second primary key column to perform queries. The query rules for subsequent primary keys are the same as those for the first two primary keys.
> - The Custom range is a left-open and right-closed interval.

iv. Set **Max Versions** to specify the maximum number of versions to return.

> **Note** You can specify a maximum of 20 versions in the console. This limit does not apply when you use Tablestore SDKs.

v. Set Sequence to **Forward Search** or **Backward Search**.

6. Click **OK**.

Data that meets the filter conditions is displayed based on the specified order on the **Data Editor** tab.

Delete data

You can delete data that you no longer need.

1.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of the required table, and click the **Data Editor** tab. You can also click **Data Editor** in the Actions column corresponding to the table.
4. On the **Query** tab, select the row that you want to delete. Click **Delete**.
5. In the **Delete** message, click **OK**.

8.1.3.5. Bind a VPC to a Tablestore instance

After you bind a VPC to a Tablestore instance, you can access the Tablestore instance from the ECS instances in the VPC in the same region.

Prerequisites

- A VPC that is within the same region as the Tablestore instance is created.
- After the VPC is created, create an ECS instance in the VPC.

Procedure

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of the required instance or click **Manage Instance** in the Actions column corresponding to the instance.
3. Click the **Network Management** tab.

4. On the **Network Management** tab, click **Bind VPC**.
5. In the **Bind VPC** dialog box, select a VPC and switch, enter **Instance VPC Name**.

   The name of a VPC can contain only letters and digits and must start with a letter. The name must be 3 to 16 bytes in length.
6. Click **OK**.

   After the VPC is bound to the instance, you can view the information of the VPC in the **VPC List** on the **Network Management** tab. You can use the VPC address to access the Tablestore instance from the ECS instances in the VPC.

   After you bind a VPC, you can perform the following operations:

   - Click **VPC Instance List** in the Actions column to view the VPC instances list, which contains the instance name, instance VPC name, and VPC domain name.
   - Click **Unbind** in the Actions column to unbind the VPC from the instance. After the VPC is unbound, the ECS instance in the VPC can no longer access the Tablestore instance by using the VPC address. To access the Tablestore instance from the ECS instance, you must bind the VPC to the Tablestore instance again.

8.1.3.6. Use Tunnel Service

After the Stream feature is enabled, you can create tunnels for the data table to consume historical and incremental data in the data table.

Background information

Tunnel Service is built on the Tablestore API to provide tunnels that are used to consume data in full, incremental, and differential modes. You can create full, incremental, and differential tunnels and consume distributed data through these tunnels in real time.

Enable Stream

After the Stream feature is enabled, the system periodically deletes expired Stream operation logs that have been stored longer than the specified period.

1. Log on to the Tablestore console.
2. On the **Overview** page, click the name of an instance or click **Manage Instance** in the Actions column that corresponds to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of a data table and then click the Tunnels tab. You can also click ⋮ in the Actions column that corresponds to the data table and select **Tunnels**.
4. On the **Tunnels** tab, find the **Stream Information** section and click **Enabled**.
5. In the **Enable Stream** dialog box, set **Log Expiration Time**.

   > **Note**
   > - **Log Expiration Time** specifies the duration after which Stream operation logs expire.
   > - The unit of **Log Expiration Time** is hour. The value must be a non-zero integer and cannot be changed after it is specified. The maximum value can be set to 168 hours.
6. Click **Enabled**.

Create tunnels

After you create a tunnel for a data table, you can use the tunnel to consume historical and incremental data in the data table.

1. Log on to the Tablestore console.

2. On the **Overview** page, click the name of an instance or click **Manage Instance** in the Actions column that corresponds to the instance.
3. In the **Tables** section of the **Instance Details** tab, click the name of a data table and then click the Tunnels tab. You can also click ⋮ in the Actions column that corresponds to the data table and select **Tunnels**.
4. On the **Tunnels** tab, click **Create Tunnel**.
5. In the **Create Tunnel** dialog box, set **Tunnel Name** and **Type**.

   Tunnel Service provides three types of tunnels to consume distributed data in real time, including **Incremental**, **Full**, and **Differential**.
6. Click **OK**.

   After you create a tunnel, you can view the information about the tunnel on the Tunnels tab.

Preview data types in a tunnel

Simulate data consumption by writing or deleting data and preview data types in the tunnel.

1. For more information about how to write data or delete data in the console, see Read and write data in the console.
2. Preview the data types in the tunnel.
   i. Log on to the Tablestore console.
   ii. On the **Overview** page, click the name of an instance or click **Manage Instance** in the Actions column that corresponds to the instance.
   iii. In the **Tables** section of the **Instance Details** tab, click the name of a data table and then click the Tunnels tab. You can also click ⋮ in the Actions column that corresponds to the data table and select **Tunnels**.
   iv. On the **Tunnels** tab, click **Show Channels** in the Actions column that corresponds to the tunnel.
   v. In the channel list, click **View Simulated Export Records** in the Actions column that corresponds to a channel.

Enable data consumption for a tunnel

Obtain the ID of the created tunnel. Use the Tablestore SDK in any programming language for Tunnel Service to enable data consumption for the tunnel.

1. Obtain the ID of the created tunnel.
   i. Log on to the Tablestore console.
   ii. On the **Overview** page, click the name of an instance or click **Manage Instance** in the Actions column that corresponds to the instance.
   iii. In the **Tables** section of the **Instance Details** tab, click the name of a data table and then click the Tunnels tab. You can also click ⋮ in the Actions column that corresponds to the data table and select **Tunnels**.
   iv. On the **Tunnels** tab, copy the ID of the created tunnel.
2. Use the Tablestore SDK in any programming language for Tunnel Service to enable data consumption for the tunnel.

```
// Customize the data consumption callback to implement the IChannelProcessor operation. Specify t
he process and shutdown methods.
private static class SimpleProcessor implements IChannelProcessor {
    @Override
    public void process(ProcessRecordsInput input) {
        System.out.println("Default record processor, would print records count");
        System.out.println(
            String.format("Process %d records, NextToken: %s", input.getRecords().size(), input.ge
tNextToken()));
        try {
            // Mock Record Process.
            Thread.sleep(1000);
        } catch (InterruptedException e) {
            e.printStackTrace();
        }
    }
    @Override
    public void shutdown() {
        System.out.println("Mock shutdown");
    }
}
// Configure advanced parameters in TunnelWorkerConfig.
TunnelWorkerConfig config = new TunnelWorkerConfig(new SimpleProcessor());
// Configure TunnelWorkers to start automatic data processing.
TunnelWorker worker = new TunnelWorker($tunnelId, tunnelClient, config);
try {
    worker.connectAndWorking();
} catch (Exception e) {
    e.printStackTrace();
    worker.shutdown();
    tunnelClient.shutdown();
}
```

9.ApsaraDB RDS for MySQL

9.1. User Guide (RDS for MySQL)

9.1.1. What is ApsaraDB RDS?

ApsaraDB RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS provides a set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four database engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these engines to meet your business requirements.

ApsaraDB RDS for MySQL

ApsaraDB RDS for MySQL is developed based on AliSQL and provides excellent performance. ApsaraDB RDS for MySQL is a tried and tested solution that handled the high-volume concurrent traffic during Double 11. ApsaraDB RDS for MySQL supports deployment with mixed x86 and ARM clusters. It integrates basic features such as whitelist configuration, backup and restoration, Transparent Data Encryption (TDE), data migration, and management for instances, accounts, and databases. ApsaraDB RDS for MySQL also provides the following advanced features:

- **Read-only instance:** In scenarios where ApsaraDB RDS for MySQL handles a small number of write requests but a large number of read requests, you can create read-only instances to scale up the reading capability and increase the application throughput.
- **Read/write splitting:** The read/write splitting feature provides a read/write splitting endpoint. This endpoint enables an automatic link for the primary instance and all of its read-only instances. An application can connect to the read/write splitting endpoint to read and write data. Write requests are distributed to the primary instance and read requests are distributed to read-only instances based on their weights. To scale up the reading capability of the system, you need only to add more read-only instances.

9.1.2. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.
5. In the top navigation bar, choose **Products > Database Services > ApsaraDB RDS**.

9.1.3. Quick start

9.1.3.1. Limits

To ensure instance stability and security, ApsaraDB RDS for MySQL has some service limits, as listed in the following table.

Operation	Description
Instance parameters	Instance parameters can be modified by using the ApsaraDB RDS console or API operations. Due to security and stability considerations, only specific parameters can be modified.
Root permissions of databases	The root or system administrator permissions are not provided.
Database backup	• Logical backup can be performed by using the command line interface (CLI) or graphical user interface (GUI). • Physical backup can be performed only by using the ApsaraDB RDS console or API operations.
Database restoration	• Logical restoration can be performed by using the CLI or GUI. • Physical restoration can be performed only by using the ApsaraDB RDS console or API operations.

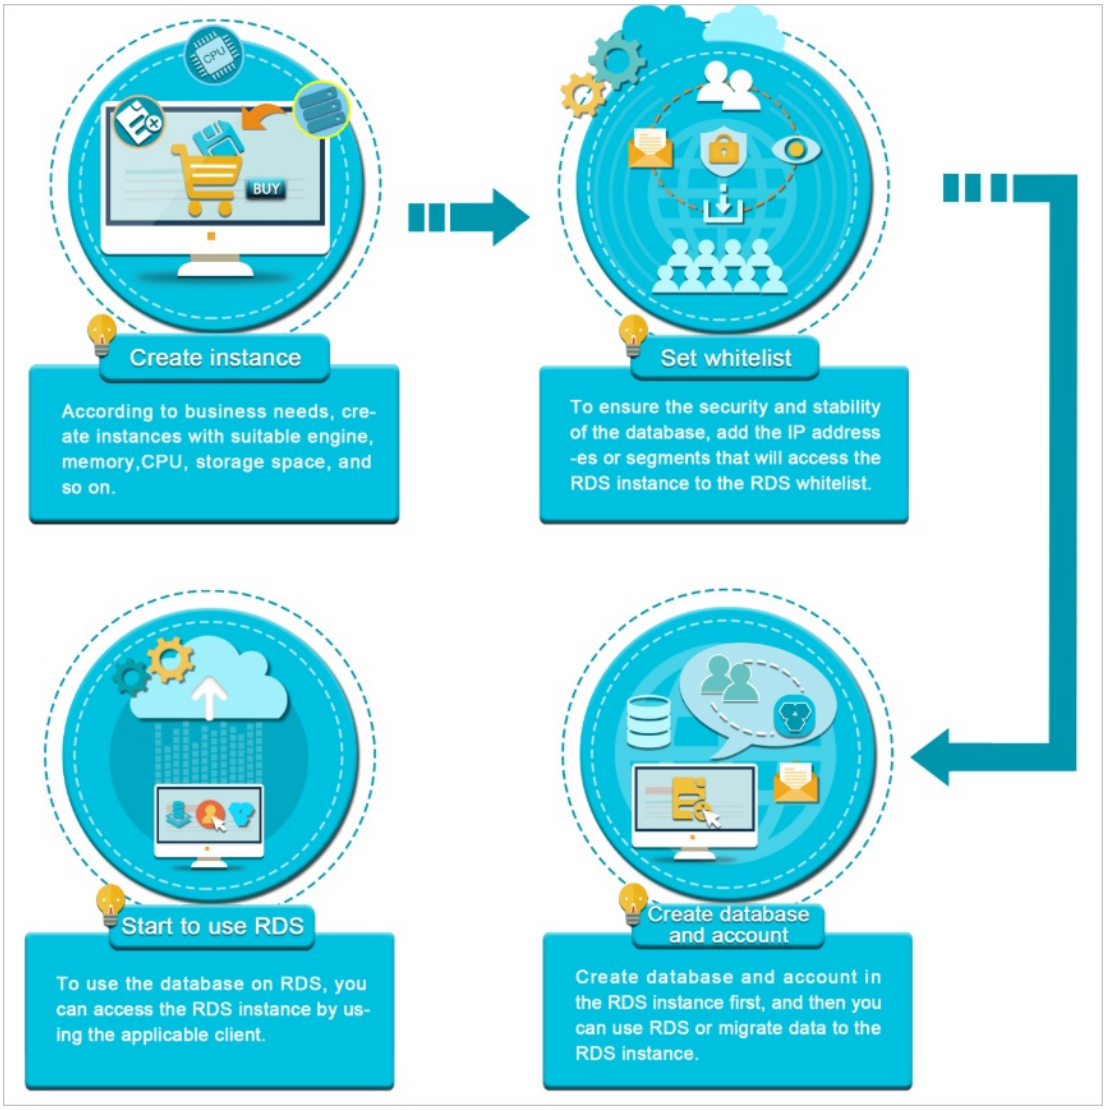
Operation	Description
ApsaraDB RDS for MySQL storage engine	Only InnoDB is supported. • To ensure performance and security, we recommend that you use the InnoDB storage engine. • The TokuDB engine is not supported. Percona no longer provides support for TokuDB, which leads to bugs that cannot be fixed and business losses in extreme cases. • The MyISAM engine is not supported. Due to the inherent shortcomings of the MyISAM engine, some data may be lost. Only some existing instances use the MyISAM engine. MyISAM engine tables in newly created instances are automatically converted to InnoDB engine tables. • The Memory engine is not supported. Newly created Memory tables are automatically converted into InnoDB tables.
Database replication	ApsaraDB RDS for MySQL provides dual-node clusters based on a primary/secondary replication architecture. The secondary instances in this replication architecture are hidden and cannot be accessed directly.
Instance restart	Instances must be restarted by using the ApsaraDB RDS console or API operations.
Account and database management	ApsaraDB RDS for MySQL manages accounts and databases by using the ApsaraDB RDS console. ApsaraDB RDS for MySQL also allows you to create a privileged account to manage users, passwords, and databases.
Standard account	• Authorization is not allowed. • The ApsaraDB RDS console allows you to manage accounts and databases. • Instances that support standard accounts also support privileged accounts.
Privileged account	• Authorization is allowed to standard accounts. • The ApsaraDB RDS console does not provide interfaces to manage accounts or databases. These operations can be performed only by using code or DMS. • The privileged account cannot be reverted to a standard account.

9.1.3.2. Procedure

ApsaraDB RDS quick start covers the following operations: creating an instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance. This topic describes how to use ApsaraDB RDS and provides all the necessary information to create an ApsaraDB RDS instance. ApsaraDB RDS for MySQL is used in the example.

Typically, after an instance is created, you must perform several operations to make the instance ready for use, as shown in Quick start flowchart.

Quick start flowchart



- Create an instance

  An instance is a virtual database server on which you can create and manage multiple databases.

- Configure a whitelist

  After you create an ApsaraDB RDS instance, you must configure its whitelist to allow access from external devices.

  Whitelists make your ApsaraDB RDS instance more secure. We recommend that you maintain whitelists on a regular basis. The whitelist configuration process does not affect the normal operations of the ApsaraDB RDS instance.

- Create a database and Create an account

  Before you use a database, you must first create the database and an account in the ApsaraDB RDS instance.

- Connect to an ApsaraDB RDS for MySQL instance

  After you create an ApsaraDB RDS instance, configure a whitelist, and create a database and an account, you can connect to the instance by using a database client.

9.1.3.3. Create an instance

This topic describes how to create one or more instances in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.

Section	Parameter	Description
Specifications	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **MySQL**.
	Chip Architecture	The chip architecture of the host on which the instance is deployed. **Note** If you do not have permissions to select this option, contact the operations administrator to authorize your account.
	Engine Version	The version of the database engine. Valid values: ○ 8.0 ○ 5.7 ○ 5.6
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Select Local SSD.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. **Note** Instances that use standard SSDs cannot be deployed in the classic network. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.

Section	Parameter	Description
Network	VPC	The VPC in which you want to create the instance. Note When Network Type is set to VPC, you must specify this parameter.
	vSwitch	The vSwitch in the VPC. Note When Network Type is set to VPC, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click Submit.

9.1.3.4. Initialization settings

9.1.3.4.1. Configure an IP address whitelist for an ApsaraDB RDS instance

After you create an ApsaraDB RDS instance, you must add the IP addresses or CIDR blocks that are used for database access to the IP address whitelist of the instance to ensure database security and reliability.

Context

IP address whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you maintain your IP address whitelists on a regular basis.

To configure a whitelist, you can perform the following operations:

- Configure an IP address whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.
- Configure an Elastic Compute Service (ECS) security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Precautions

- The default IP address whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Introduction to IPv6

IPv4 addresses are widely used, but the limited number of IPv4 addresses restricts the development of the Internet. Compared with IPv4 addresses, IPv6 addresses are more sufficient and allow more types of devices to access the Internet. ApsaraDB RDS supports both IPv4 and IPv6 addresses.

The following table describes the differences between IPv4 and IPv6.

Item	IPv4	IPv6
Address length	32 bits (4 bytes)	128 bits (16 bytes)

Item	IPv4	IPv6
Number of addresses	2^32	2^128
Address format	xxx.xxx.xxx.xxx Where xxx is a decimal number that can range from 0 to 255. Each x is a decimal integer, and leading zeros can be omitted. Example: 192.168.1.1	xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx Where each x is a hexadecimal number, and leading zeros can be omitted. You can use a double colon (::) once in an IPv6 address to indicate a series of zeros. Example: CDDC:0000:0000:0000:8475:1111:3900:2020
Address Resolution Protocol (ARP)	Uses broadcast ARP Request frames to resolve an IP address to a link layer address.	Uses multicast neighbor solicitation messages to resolve an IP address to a link layer address.
Security	Implements a security mechanism based on applications and cannot provide protections at the IP layer.	Supports packet fragmentation to ensure data confidentiality and integrity and provides security at the IP layer.
LAN connection	Connects to LANs by using network interfaces.	Can work with Ethernet adapters and is supported over virtual Ethernet networks between logical partitions.
Address type	• Unicast address • Multicast address • Broadcast address	• Unicast address • Multicast address • Anycast address

Create an IP address whitelist

Each IP address whitelist of an ApsaraDB RDS instance can contain **IPv4** or **IPv6** addresses. By default, the system provides an IP address whitelist of the **IPv4** type. If you want an IP address whitelist of the **IPv6** type, manually create one.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Create Whitelist**. In the dialog box that appears, configure the following parameters.

Parameter	Description
Whitelist Name	The name of the IP address whitelist. **Note** ◦ The name can contain lowercase letters, digits, and underscores (_). ◦ The name must start with a lowercase letter and end with a lowercase letter or digit. ◦ The name must be 2 to 32 characters in length.

Parameter	Description
IP Type	The IP type of the IP address whitelist. Valid values: ○ **IPv4** ○ **IPv6** **Note** For more information about the differences between IPv4 and IPv6, see the "Introduction to IPv6" section of this topic.
IP Addresses	The IP addresses that are allowed to access the instance.

Configure an IP address whitelist

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Edit** corresponding to an IP address whitelist.

   Note If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.

5. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance and click **OK**.

Note

- Limits for **IPv4** addresses:
  - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.

    Supported formats are `0.0.0.0/0`, IP addresses such as `10.23.12.24`, or CIDR blocks such as `10.23.12.24/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits.
  - If an IP address whitelist is empty or contains `0.0.0.0/0`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
- Limits for **IPv6** addresses:
  - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.

    Supported formats are `::`, IP addresses such as `0:0:0:0:0:0:0:1`, or CIDR blocks such as `0:0:0:0:0:0:0:1/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 128 bits.
  - If an IP address whitelist is empty or contains only `::`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
- You cannot specify both **IPv4** and **IPv6** addresses in a single IP address whitelist. If you want to specify both IPv4 and IPv6 addresses, specify them in separate IP address whitelists.
- If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances that are created within your Apsara Stack tenant account appear. Then, you can select the IP addresses and add them to an IP address whitelist.

9.1.3.4.2. Create an account

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance. This topic describes how to create privileged and standard accounts.

Context

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB RDS console. For more information about permissions that can be granted to each type of account, see Account permissions.

Account type	Description
Privileged account	• You can create and manage privileged accounts by using the ApsaraDB RDS console or API operations. • You can create only a single privileged account on each ApsaraDB RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. • A privileged account allows you to manage permissions to a fine-grained level. For example, you can grant each standard account the permissions to query specific tables. • A privileged account has the permissions to disconnect all standard accounts on the instance.

Account type	Description
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create up to 500 standard accounts on an instance. • You must manually grant standard accounts the specific database permissions. • You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Maximum number of databases	Maximum number of tables	Maximum number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the engine parameter settings of the instance.
Standard account	500	< 200,000	Varies based on the engine parameter settings of the instance.

Create a privileged account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, click **Create Account**.
5. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ◦ The name is 1 to 16 characters in length. ◦ The name starts with a lowercase letter and ends with a lowercase letter or digit. ◦ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.
Password	Enter the password of the account. The password must meet the following requirements: ◦ The password is 8 to 32 characters in length. ◦ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ◦ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

6. Click **Create**.

Reset the permissions of a privileged account

If an issue occurs on the privileged account, you can enter the password of the privileged account to reset permissions. For example, you can reset the permissions if the permissions are unexpectedly revoked.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, find the privileged account and click **Reset Permissions** in the **Actions** column.
5. On the **Initialize Account** page, enter the password of the privileged account and click **OK**.

Create a standard account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, click **Create Account**.
5. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Standard Account.
Authorized Databases	Select one or more databases on which you want to grant permissions to the account. You can also leave this parameter empty at this time and authorize databases after the account is created. i. Select one or more databases from the Unauthorized Databases section and click **Add** to add them to the Authorized Databases section. ii. In the Authorized Databases section, select the **Read/Write**, **Read-only**, **DDL Only**, or **DML Only** permissions on each authorized database. If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as **Set All to Read/Write**.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

6. Click **Create**.

Account permissions

Account type	Authorization type	Permission				
Privileged account	None	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	None	None
Standard account	**Read-only**	SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	None	None	None	None
	Read/write	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	REFERENCES	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
		ALTER ROUTINE	EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	None	None	None	None
	DDL-only	CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	None	None
	DML-only	SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	None	None

9.1.3.4.3. Create a database

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Databases**.
4. Click **Create Database**. On the page that appears, configure the following parameters.

Parameter	Description
Database Name	○ The name must be 1 to 64 characters in length. ○ The name must start with a letter and end with a letter or a digit. ○ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ○ The name must be unique within the instance.
Supported Character Sets	Select **utf8**, **gbk**, **latin1**, **utf8mb4**, or **all**. If you want to use other character sets, select **all**, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description must be 2 to 256 characters in length.

5. Click **Create**.

9.1.3.5. Connect to an ApsaraDB RDS for MySQL instance

After you complete the initial configuration of your ApsaraDB RDS for MySQL instance, you can connect to it from an Elastic Compute Service (ECS) instance or an on-premises client.

Context

After you perform operations such as Create an instance, Configure a whitelist, and Create an account, you can use a general database client or configure the endpoint, port number, and account information in an application to connect to the ApsaraDB RDS for MySQL instance.

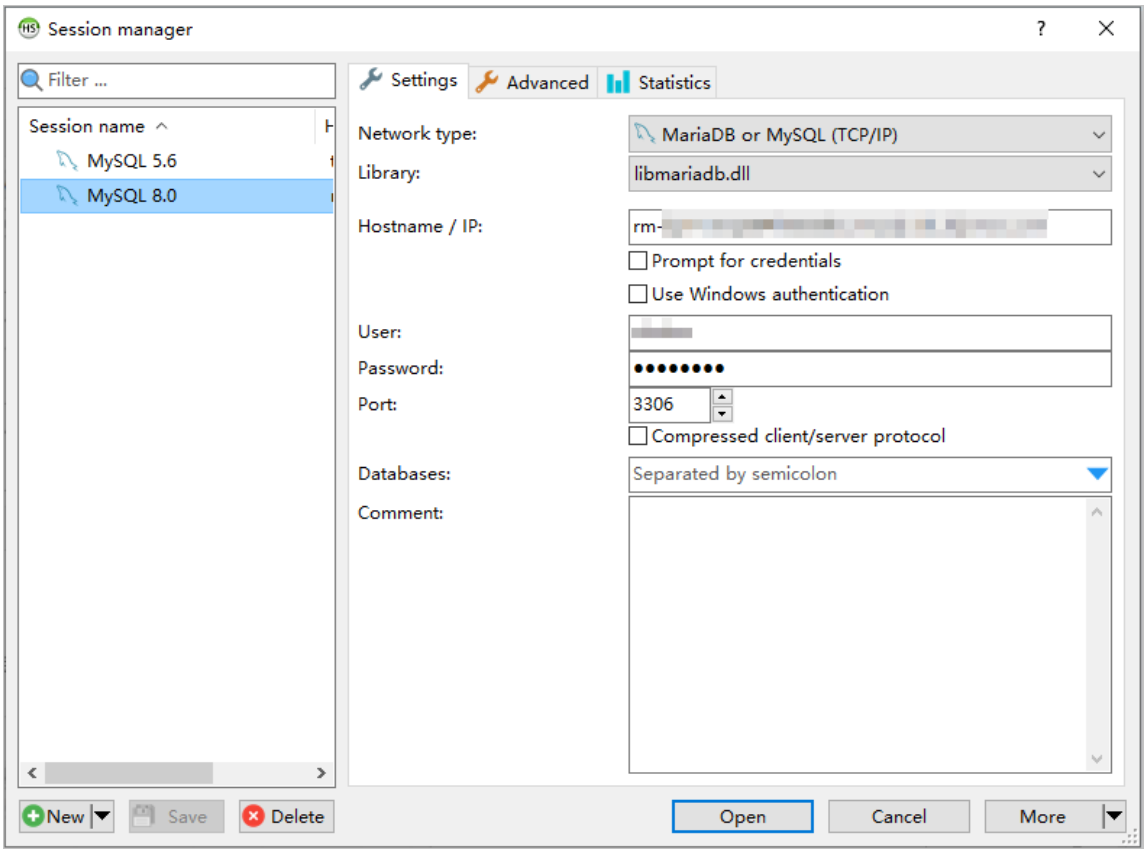
If you need to connect an ECS instance to an ApsaraDB RDS instance, you must make sure that both instances are in the classic network or in the same virtual private cloud (VPC), and the IP address of the ECS instance is added to an IP address whitelist of the ApsaraDB RDS instance.

Connect to an instance from a client

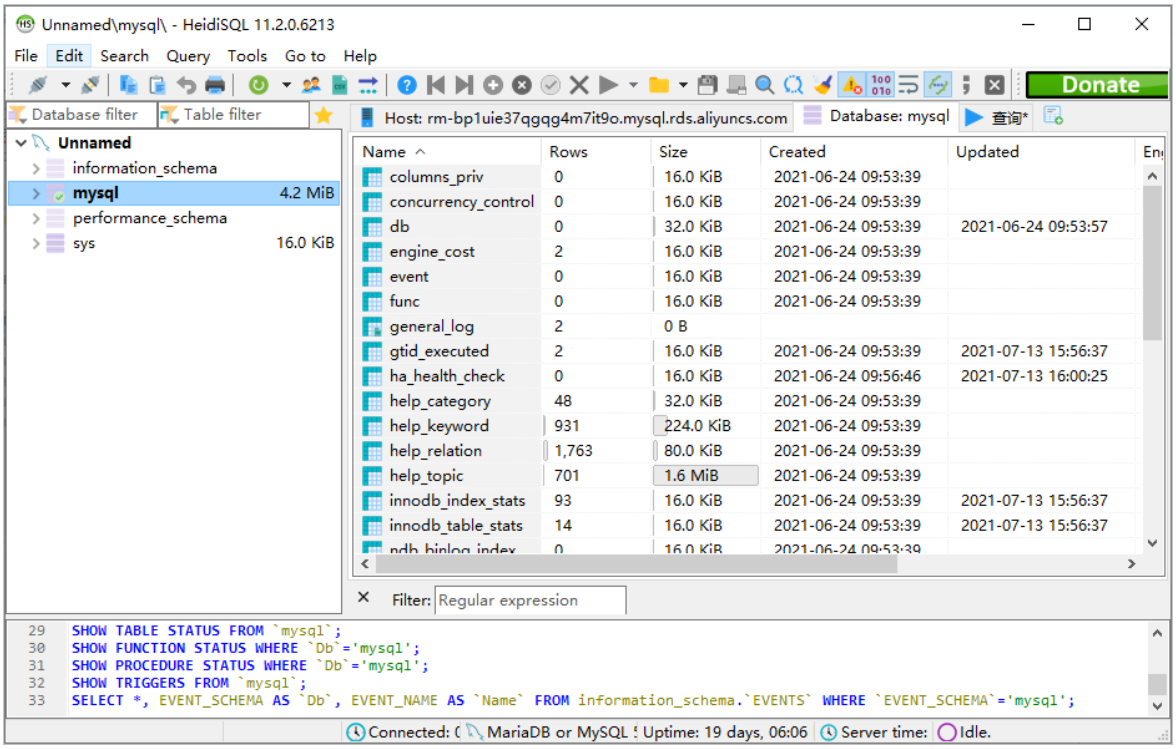
ApsaraDB RDS for MySQL is fully compatible with open source MySQL. You can connect to an ApsaraDB RDS instance from a database client by using a method similar to the method that is used to connect to an open source MySQL database. In the following example, the HeidiSQL client is used.

1. Start the HeidiSQL client.
2. In the lower-left corner of the Session manager dialog box, click **New**.
3. Enter information about the ApsaraDB RDS instance to which you want to connect. The following table describes the required parameters.

Parameter	Description
Network type	Select the network type of the ApsaraDB RDS instance to which you want to connect. For example, select **MariaDB or MySQL (TCP/IP)**.
Hostname / IP	Enter the internal or public endpoint of the ApsaraDB RDS instance. ○ If your client is deployed on an ECS instance that is in the same region and has the same network type as the ApsaraDB RDS instance, use the internal endpoint. For example, if the ECS and ApsaraDB RDS instances are both in a VPC located in the China (Hangzhou) region, you can use the internal endpoint of the ApsaraDB RDS instance to create a secure connection. ○ In other scenarios, use the public endpoint. To view the internal and public endpoints and port numbers of the ApsaraDB RDS instance, perform the following operations: i. Log on to the ApsaraDB for RDS console. ii. Find the ApsaraDB RDS instance to which you want to connect and click its ID. iii. In the **Basic Information** section, view the internal and public endpoints and port numbers of the instance.
User	Enter the name of the account used to connect to the ApsaraDB RDS instance.
Password	Enter the password of the account used to connect to the ApsaraDB RDS instance.
Port	If you connect to the instance over an internal network, enter the internal port number of the instance. If you connect to the instance over the Internet, enter the public port number of the instance.



4. Click **Open**. If the connection information is correct, you can connect to the instance.



9.1.4. Instances

9.1.4.1. Create an instance

This topic describes how to create one or more instances in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	**Organization**	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.

Section	Parameter	Description
Region	**Deployment Method**	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	**Quantity**	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **MySQL**.
	Chip Architecture	The chip architecture of the host on which the instance is deployed. **Note** If you do not have permissions to select this option, contact the operations administrator to authorize your account.
	Engine Version	The version of the database engine. Valid values: ○ 8.0 ○ 5.7 ○ 5.6
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Select Local SSD.

Section	Parameter	Description
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. **Note** Instances that use standard SSDs cannot be deployed in the classic network. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	The VPC in which you want to create the instance. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	The vSwitch in the VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

9.1.4.2. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as its basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of an instance to go to the **Basic Information** page.
   - On the **Instances** page, click **Manage** in the **Actions** column corresponding to an instance to go to the **Basic Information** page.

9.1.4.3. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS instance. This applies if the number of connections exceeds the specified threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click **Restart Instance** in the upper-right corner.

   > **Note** When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

4. In the Restart Instance message, click **Confirm**.

9.1.4.4. Change the specifications of an instance

This topic describes how to change the specifications of your instance, such as the instance type and storage capacity, if the specifications do not meet the requirements of your application.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the upper-right corner of the **Configuration Information** section, click **Change Specifications**.
4. On the **Change Specifications** page, set **Edition**, **Instance Type**, and **Storage Capacity**.
5. Click **Submit**.

9.1.4.5. Set a maintenance window

This topic describes how to set a maintenance window for an ApsaraDB RDS instance.

Context

To ensure the stability of ApsaraDB RDS instances, the backend system performs maintenance of the instances at irregular intervals. The default maintenance window is from 02:00 to 06:00. You can set the maintenance window to the off-peak period of your business to avoid impact on business.

Precautions

- To ensure stability of the maintenance process, the instance changes to the **Maintaining Instance** state before the maintenance window. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, except for account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- You may encounter a network interruption during the maintenance window. Make sure that your application is configured to automatically reconnect to the instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
4. Select a maintenance window and click **Save**.

> **Note** The maintenance window is displayed in UTC+8.

9.1.4.6. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB RDS instances to improve database availability.

Context

ApsaraDB RDS supports the following data replication modes:

- Semi-sync

  After an application-initiated update is complete on the primary instance, logs are synchronized to all secondary instances. This transaction is considered committed after at least one secondary instance has received the logs, regardless of whether the secondary instance finishes executing the updates specified in the logs.

  If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication degrades to the asynchronous mode.

- Asynchronous

  When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, the unavailability of secondary instances does not affect the operations on the primary instance. Data remains consistent even if the primary instance is unavailable.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Service Availability**.
4. In the upper-right corner of the **Availability Information** section, click **Change Data Replication Mode**.
5. In the dialog box that appears, select a data replication mode and click **OK**.

9.1.4.7. Release an instance

This topic describes how to manually release an instance.

Precautions

- Only instances in the running state can be manually released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Actions** column corresponding to the instance you want to release, choose **More > Release Instance**.
4. In the message that appears, click **OK**.

9.1.4.8. Update the minor version of an instance

ApsaraDB RDS for MySQL supports automatic and manual updates of the minor version. These updates increase performance, provide new features, and fix known issues.

Introduction

By default, ApsaraDB RDS for MySQL automatically updates the minor version. You can log on to the ApsaraDB RDS console, go to the **Basic Information** page of your ApsaraDB RDS instance, and then view the current **Minor Version Upgrade Mode** in the Configuration Information section.

- **Auto**: When a new minor version is released, the system automatically updates the minor version of your instance during the specified maintenance window. For more information, see Set a maintenance window.
- **Manual**: You can manually update the minor version on the **Basic Information** page. For more information, see Manually update the minor version.

Precautions

- When you update the minor engine version of your ApsaraDB RDS instance, a network interruption of about 30 seconds may occur. We recommend that you update the minor engine version during off-peak hours or make sure that your application is configured to automatically reconnect to the instance.
- After you update the minor engine version of your ApsaraDB RDS instance, you cannot downgrade the instance version.
- After you upgrade the specifications of your ApsaraDB RDS instance, ApsaraDB RDS updates the instance to the latest minor engine version.

Change the minor version update mode

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Configuration Information** section of the Basic Information page, click **Configure** to the right of **Minor Version Upgrade Mode**.
4. In the dialog box that appears,select **Auto** or **Manual** and click **OK**.

> **Note** By default, the minor version update mode is set to **Auto**.

Manually update the minor version

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Configuration Information** section of the page, click **Upgrade Minor Engine Version**.

> **Note** The **Upgrade Minor Engine Version** button is displayed only when a new minor version is available.

4. In the dialog box that appears, specify the update time and click **OK**.

FAQ

- Q: After I updated the minor version of my ApsaraDB RDS instance, the MySQL version remains unchanged. Why?

  A: The minor version that you updated is the minor engine version of ApsaraDB RDS, but not the MySQL version. To view the minor version of your instance, you can execute the `show variables like '%rds_release_date%'` statement.

- Q: When an update takes effect, is my instance updated only to the next minor version?

  A: No, when an update takes effect, your instance is updated to the latest minor version.

9.1.4.9. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can select specific parameters to modify in the ApsaraDB RDS console.
- When you modify parameters on the **Editable Parameters** tab, you can refer to the **Value Range** column corresponding to each parameter.
- After some parameters are modified, you must restart your ApsaraDB RDS instance for the changes to take effect. You can refer to the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your applications are configured to automatically reconnect to your instance.

Modify parameters

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Parameters**.
4. Perform the following operations:

   Export the parameter settings of the ApsaraDB RDS instance to your computer.

   On the Editable Parameters tab, click **Export Parameters**. The parameter settings of the ApsaraDB RDS instance are exported as a TXT file to your computer.

   Modify and import the parameter settings.

   i. After you modify parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.

   ii. Click **OK**.

   iii. In the upper-right corner of the page, click **Apply Changes**.

   > **Note**
   > - If the new parameter value takes effect only after you restart your instance, the system prompts you to restart the ApsaraDB RDS instance. We recommend that you restart the ApsaraDB RDS instance during off-peak hours and make sure that your applications are configured to automatically reconnect to your instance.
   > - Before the new parameter values are applied, you can click **Cancel Changes** to cancel the modification.

   Modify a single parameter.

   i. On the **Editable Parameters** tab, find the parameter that you want to modify and click the icon in the **Actual Value** column.

   ii. Enter a new value based on the value range that is displayed.

   iii. Click **Confirm**.

iv. In the upper-right corner of the page, click **Apply Changes**.

> **Note**
>
> - If the new parameter value takes effect only after you restart your instance, the system prompts you to restart the ApsaraDB RDS instance. We recommend that you restart the ApsaraDB RDS instance during off-peak hours and make sure that your applications are configured to automatically reconnect to your instance.
> - Before the new parameter value is applied, you can click **Cancel Changes** to cancel the modification.

View the parameter modification history

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Parameters**.
4. On the Parameters page, click the **Edit History** tab.
5. Select a time range and click **Search**.

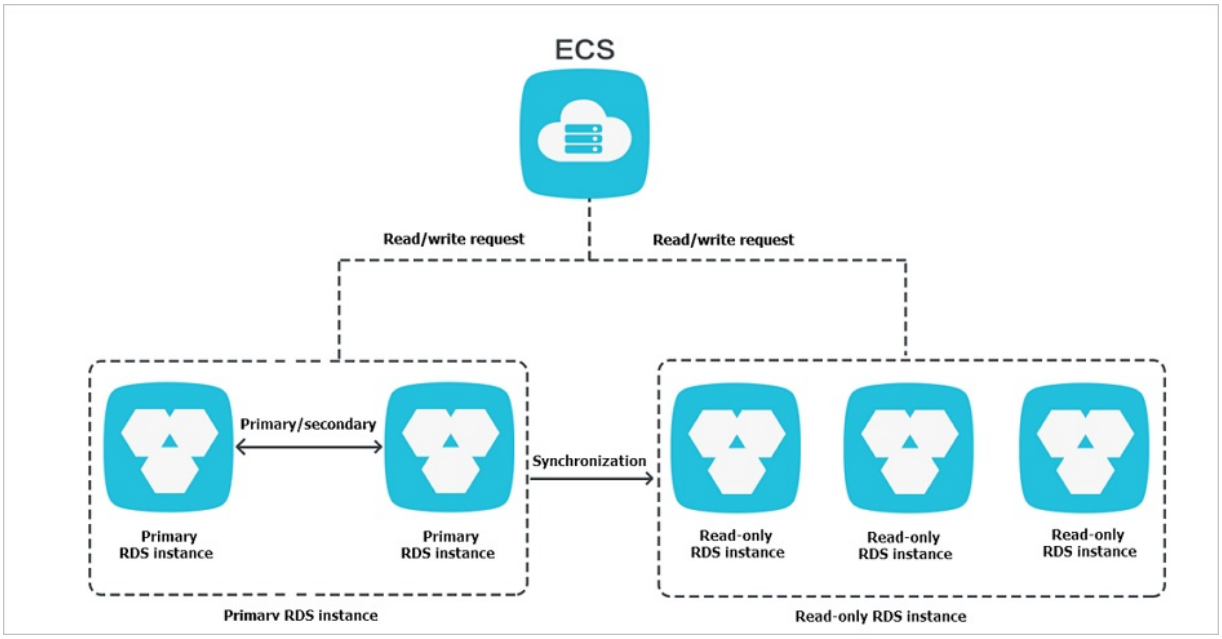
9.1.4.10. Read-only instances

9.1.4.10.1. Overview of read-only instances

ApsaraDB RDS for MySQL allows you to create read-only instances. In scenarios where an instance has a small number of write requests but a large number of read requests, you can create read-only instances to distribute database access loads away from the primary instance. This topic describes the features and limits of read-only instances.

To scale up the reading capability and distribute database access loads, you can create one or more read-only instances in a region. Read-only instances can increase the application throughput when a large amount of data is being read.

A read-only instance with a single physical node and no backup node uses the native replication capability of MySQL to synchronize changes from the primary instance to all its read-only instances. Read-only instances must be in the same region as the primary instance but do not have to be in the same zone as the primary instance. The following figure shows the topology of read-only instances.



Read-only instances have the following features:

- Specifications of a read-only instance can be different from those of the primary instance and can be changed at any time. This facilitates elastic scaling.
- Read-only instances do not require account or database maintenance. Account and database information is synchronized from the primary instance.
- The whitelists of read-only instances can be independently configured.
- System performance monitoring is provided.

  ApsaraDB RDS provides up to 20 system performance monitoring views, including those for disk capacity, IOPS, connections, CPU utilization, and network traffic. You can view the load of instances.
- ApsaraDB RDS provides a variety of optimization recommendations, such as storage engine check, primary key check, large table check, and check for excessive indexes and missing indexes. You can optimize your databases based on the optimization recommendations and specific applications.

9.1.4.10.2. Create a read-only instance

You can create read-only instances of different specifications based on your business requirements.

Precautions

- A maximum of five read-only instances can be created for a primary instance.
- Backup settings and temporary backup are not supported.
- Instance restoration is not supported.
- Data migration to read-only instances is not supported.
- Database creation and deletion are not supported.
- Account creation, deletion, authorization, and password changes are not supported.
- After a read-only instance is created, you cannot restore data by directly overwriting the primary instance with a backup set.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Distributed by Instance Role** section on the right side of the **Basic Information** page, click **Create**

Read-only Instance.

4. On the **Create Read-only RDS Instance** page, configure the read-only instance parameters.

Section	Parameter	Description
Region	**Region**	The region in which you want to create the read-only instance.
Specifications	**Database Engine**	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The version of the database engine, which is the same as that of the primary instance and cannot be changed.
	Edition	Set the value to **Read-only**.
	Instance Type	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade.
	Storage Capacity	The storage capacity of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage capacity as the primary instance for the read-only instance. Valid values: 20 to 6000. Unit: GB. The value is in 1 GB increments.
Network Type	**Network Type**	The network type of the read-only instance. This must be the same as that of the primary instance and cannot be changed.
	VPC	The VPC in which you want to create the read-only instance.
	vSwitch	The vSwitch in the VPC.

5. Click **Submit**.

9.1.4.10.3. View details of read-only instances

This topic describes how to view details of read-only instances. You can go to the Basic Information page of a read-only instance from the Instances page or from the read-only instance list of the primary instance. Read-only instances are managed in the same manner as primary instances. The Basic Information page shows the management operations that can be performed.

View details of a read-only instance from the Instances page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click the ID of a read-only instance. The **Basic Information** page appears.

> **Note** In the instance list, **Instance Role** of read-only instances is displayed as Read-only Instance.

View details of a read-only instance from the Basic Information page of the primary instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. On the **Basic Information** page, move the pointer over the number below **Read-only Instances** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
4. Click the ID of the read-only instance to go to the Basic Information page of the read-only instance.

9.1.5. Accounts

9.1.5.1. Create an account

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance. This topic describes how to create privileged and standard accounts.

Context

ApsaraDB RDS for MySQL supports two types of database accounts: privileged and standard. You can manage all your accounts and databases in the ApsaraDB RDS console. For more information about permissions that can be granted to each type of account, see Account permissions.

Account type	Description
Privileged account	• You can create and manage privileged accounts by using the ApsaraDB RDS console or API operations. • You can create only a single privileged account on each ApsaraDB RDS instance. The privileged account can be used to manage all standard accounts and databases on the instance. • A privileged account allows you to manage permissions to a fine-grained level. For example, you can grant each standard account the permissions to query specific tables. • A privileged account has the permissions to disconnect all standard accounts on the instance.
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create up to 500 standard accounts on an instance. • You must manually grant standard accounts the specific database permissions. • You cannot use a standard account to create, manage, or disconnect other accounts from databases.

Account type	Maximum number of databases	Maximum number of tables	Maximum number of accounts
Privileged account	Unlimited	< 200,000	Varies based on the engine parameter settings of the instance.
Standard account	500	< 200,000	Varies based on the engine parameter settings of the instance.

Create a privileged account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, click **Create Account**.
5. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).
Account Type	Select Privileged Account.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

6. Click **Create**.

Reset the permissions of a privileged account

If an issue occurs on the privileged account, you can enter the password of the privileged account to reset permissions. For example, you can reset the permissions if the permissions are unexpectedly revoked.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, find the privileged account and click **Reset Permissions** in the **Actions** column.
5. On the **Initialize Account** page, enter the password of the privileged account and click **OK**.

Create a standard account

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts** to go to the **Accounts** page.
4. On the **Accounts** tab, click **Create Account**.
5. On the **Create Account** page, configure the following parameters.

Parameter	Description
Database Account	Enter the name of the account. The account name must meet the following requirements: ○ The name is 1 to 16 characters in length. ○ The name starts with a lowercase letter and ends with a lowercase letter or digit. ○ The name contains lowercase letters, digits, and underscores (_).

Parameter	Description
Account Type	Select Standard Account.
Authorized Databases	Select one or more databases on which you want to grant permissions to the account. You can also leave this parameter empty at this time and authorize databases after the account is created. i. Select one or more databases from the Unauthorized Databases section and click **Add** to add them to the Authorized Databases section. ii. In the Authorized Databases section, select the **Read/Write**, **Read-only**, **DDL Only**, or **DML Only** permissions on each authorized database. If you want to grant the same permissions on multiple databases to the account, click the button in the upper-right corner of the section. The button may appear as **Set All to Read/Write**.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @ # $ % ^ & * ( ) _ + - =
Re-enter Password	Enter the password of the account again.
Description	Optional. Enter information about the account to facilitate subsequent management. The description can be up to 256 characters in length.

6. Click **Create**.

Account permissions

Account type	Authorization type	Permission				
Privileged account	None	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	RELOAD	PROCESS	REFERENCES	INDEX
		ALTER	CREATE TEMPORARY TABLES	LOCK TABLES	EXECUTE	REPLICATION SLAVE
		REPLICATION CLIENT	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		CREATE USER	EVENT	TRIGGER	None	None

Account type	Authorization type	Permission				
Standard account	Read-only	SELECT	LOCK TABLES	SHOW VIEW	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	None	None	None	None
	Read/write	SELECT	INSERT	UPDATE	DELETE	CREATE
		DROP	REFERENCES	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	CREATE VIEW	SHOW VIEW	CREATE ROUTINE
		ALTER ROUTINE	EVENT	TRIGGER	PROCESS	REPLICATION SLAVE
		REPLICATION CLIENT	None	None	None	None
	DDL-only	CREATE	DROP	INDEX	ALTER	CREATE TEMPORARY TABLES
		LOCK TABLES	CREATE VIEW	SHOW VIEW	CREATE ROUTINE	ALTER ROUTINE
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	None	None
	DML-only	SELECT	INSERT	UPDATE	DELETE	CREATE TEMPORARY TABLES
		LOCK TABLES	EXECUTE	SHOW VIEW	EVENT	TRIGGER
		PROCESS	REPLICATION SLAVE	REPLICATION CLIENT	None	None

9.1.5.2. Reset the password

You can use the ApsaraDB RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts**.
4. Find an account and click **Reset Password** in the **Actions** column.

5. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

> **Note** The password must meet the following requirements:
> - The password is 8 to 32 characters in length.
> - The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include
>
> ! @ # $ % ^ & * ( ) _ + - =

9.1.5.3. Edit account permissions

You can edit the account permissions of your ApsaraDB RDS instance at any time.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts**.
4. Find an account and click **Edit Permissions** in the **Actions** column.

> **Note** You can edit the permissions of a standard account. The permissions of privileged accounts can only be reset to the default settings and cannot be changed to a specific set of permissions.

5. Configure the following parameters.

Parameter	Description
Authorized Databases	In the **Unauthorized Databases** section, select a database and click **Add** to authorize the database. In the **Authorized Databases** section, select a database and click **Remove** to remove the permissions from the database.
Permission	You can set permissions on each database in the Authorized Database section. You can also click the button such as **Set All to Read/Write** in the upper-right corner to set the permissions of the account on all authorized databases. ○ **Read-only**: grants the account read-only permissions on databases. ○ **Read/Write**: grants the account read and write permissions on databases. ○ **DDL Only**: grants the account DDL permissions on databases. ○ **DML Only**: grants the account DML permissions on databases.

6. Click **OK**.

9.1.5.4. Delete an account

You can delete a database account in the ApsaraDB RDS console.

Prerequisites

You can use the console to delete privileged and standard accounts that are no longer used.

Procedure

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts**.
4. Find the account that you want to delete and click **Delete** in the Actions column.
5. In the message that appears, click **Confirm**.

> **Note** Accounts in the **Processing** state cannot be deleted.

9.1.6. Databases

9.1.6.1. Create a database

After you create an ApsaraDB RDS instance and configure its IP address whitelist, you must create a database and an account on the instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Databases**.
4. Click **Create Database**. On the page that appears, configure the following parameters.

Parameter	Description
Database Name	◦ The name must be 1 to 64 characters in length. ◦ The name must start with a letter and end with a letter or a digit. ◦ The name can contain lowercase letters, digits, underscores (_), and hyphens (-). ◦ The name must be unique within the instance.
Supported Character Sets	Select **utf8**, **gbk**, **latin1**, **utf8mb4**, or **all**. If you want to use other character sets, select **all**, and then select the required character set from the list.
Description	Optional. Enter information about the database to facilitate subsequent management. The description must be 2 to 256 characters in length.

5. Click **Create**.

9.1.6.2. Delete a database

You can delete databases that are no longer used in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Databases**.
4. Find the database that you want to delete and click **Delete** in the **Actions** column.
5. In the Delete Database message, click **Confirm**.

9.1.7. Database connection

9.1.7.1. Change the endpoint and port number of an instance

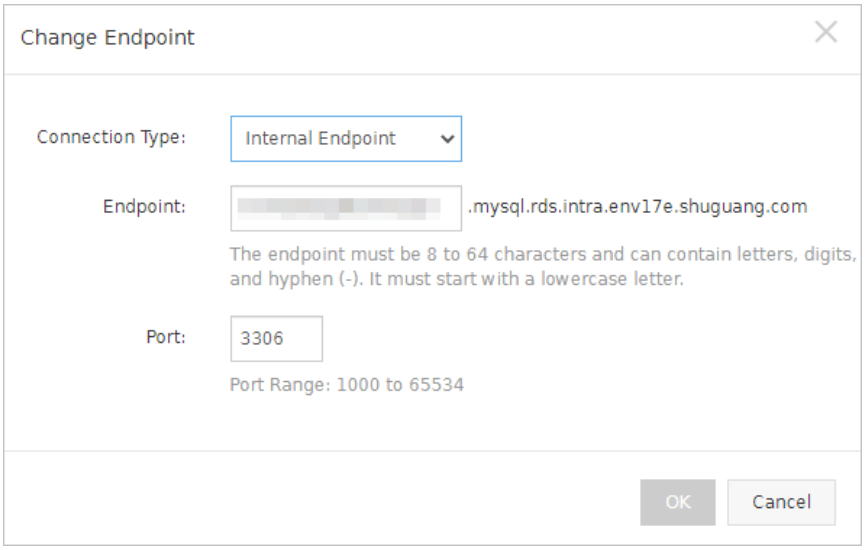
This topic describes how to view and change the endpoint and port number of an ApsaraDB RDS instance.

View the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Basic Information** section, view the internal and public endpoints and port numbers.

Change the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. In the upper-right corner of the Database Connection section, click **Change Endpoint**.
5. In the dialog box that appears, set Connection Type, Endpoint, and Port, and then click **OK**.



> **Note**
> - The prefix of an endpoint must be 8 to 64 characters in length and can contain letters, digits, and hyphens (-). It must start with a lowercase letter.
> - The port number must be a value within the range of 1000 to 65534.

9.1.7.2. Apply for and release an internal endpoint or a public endpoint for an instance

ApsaraDB RDS supports two types of endpoints: internal endpoints and public endpoints. The default type of the endpoint used to connect to an ApsaraDB RDS instance is determined by the network connection type selected when you create the instance. This topic describes how to apply for and release an internal endpoint or a public endpoint for an ApsaraDB RDS instance.

Apply for an internal endpoint or a public endpoint

If you set **Connection Type** to **Internet** when you create an ApsaraDB RDS instance, the database system assigns a public endpoint to the instance and you can apply for an internal endpoint. Otherwise, the database system assigns an internal endpoint to the instance, and you can apply for a public endpoint.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. Apply for an internal endpoint or a public endpoint:
   - To apply for a public endpoint, click **Apply for Public Endpoint**.
   - To apply for en internal endpoint, click **Apply for Internal Endpoint**.
5. In the message that appears, click **OK**.

Release an internal endpoint or a public endpoint

If an endpoint is no longer needed, you can release the endpoint to ensure instance security.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. Release an internal endpoint or a public endpoint:
   - To release a public endpoint, click **Release Public Endpoint**.
   - To release an internal endpoint, click **Release Internal Endpoint**.
5. In the message that appears, click **OK**.

FAQ

- Q: Can I change the endpoints and port numbers of my ApsaraDB RDS instance?

  A: No, you cannot change the endpoints of your ApsaraDB RDS instance. You can change the prefixes of the endpoints. You can also change the port numbers of your instance. For more information, see Change the endpoint and port number of an instance.

- Q: Can I configure the endpoints of my ApsaraDB RDS instances to static IP addresses?

  A: No, you cannot configure the endpoints of your ApsaraDB RDS instance to static IP addresses. Both primary/secondary switchovers and specification changes may cause changes to the IP addresses. We recommend that you connect to your instance by using an endpoint. This allows you to minimize impacts on your workloads and eliminates the need to modify configuration data on your application.

- Q: How do I connect to my ApsaraDB RDS instance by using a public endpoint?

  A: You can connect to your ApsaraDB RDS instance from an ECS instance or a database client. For more information, see Connect to an ApsaraDB RDS for MySQL instance.

9.1.7.3. Use DMS to log on to an ApsaraDB RDS instance

This topic describes how to use Data Management (DMS) to log on to an ApsaraDB RDS instance.

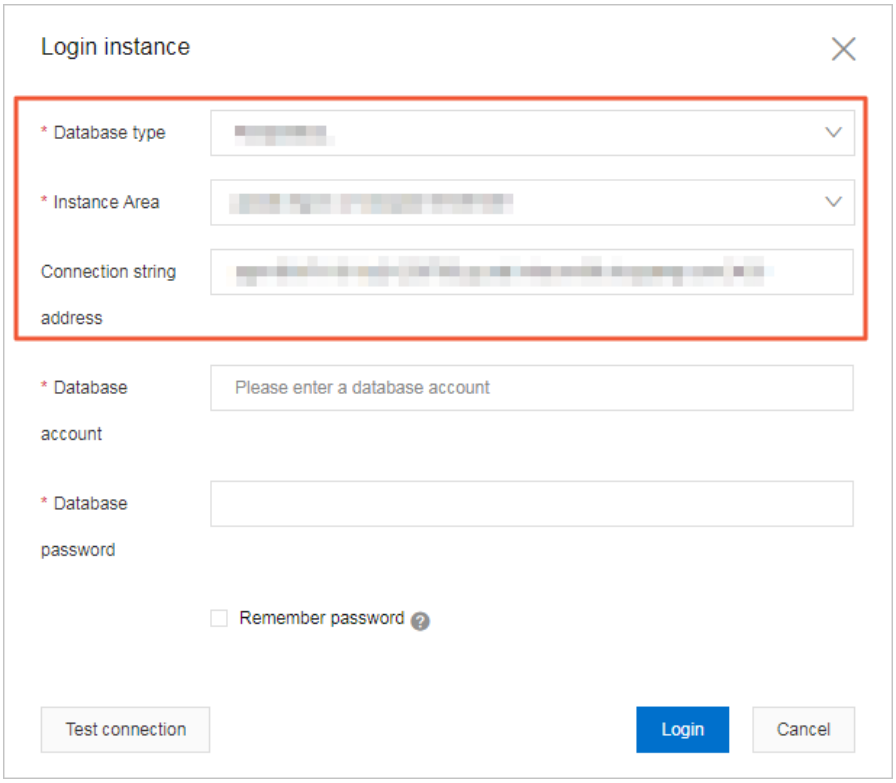
Prerequisites

An IP address whitelist is configured. For more information about how to configure an IP address whitelist, see Configure a whitelist.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. Click **Log On to DB** in the upper-right corner of the page.
4. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

5. Click **Login**.

> **Note** If you want the browser to remember the password, select **Remember password** before you click **Login**.

9.1.7.4. Configure the hybrid access solution for an instance

This topic describes how to configure the hybrid access solution for an ApsaraDB RDS instance. This solution allows you to retain both the classic network endpoint and Virtual Private Cloud (VPC) endpoint of your ApsaraDB RDS instance. This way, you can migrate your ApsaraDB RDS instance from the classic network to a VPC without network interruptions.

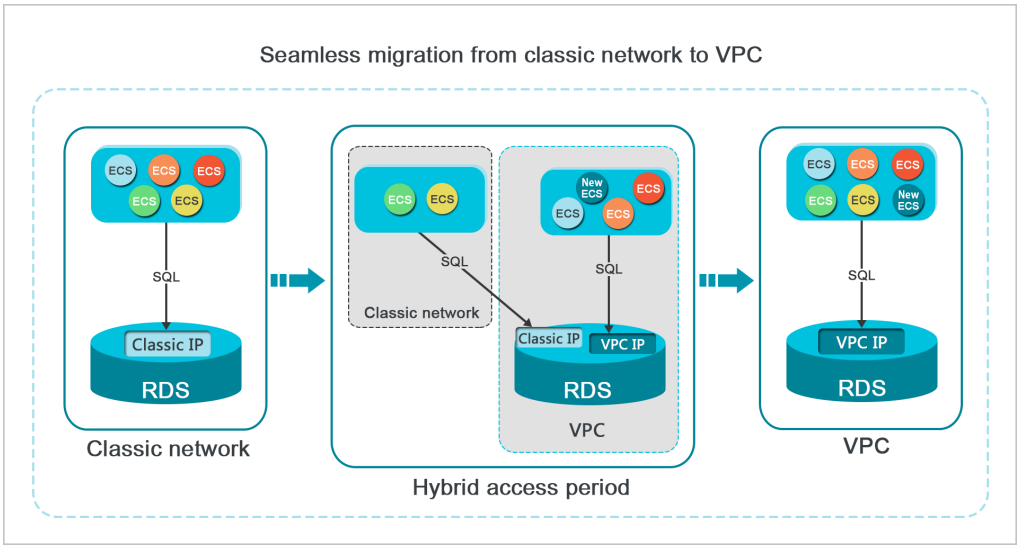
Background information

When you migrate your ApsaraDB RDS instance from the classic network to a VPC, the internal classic network endpoint of the instance changes to the internal VPC endpoint. In this case, the endpoint remains unchanged, but the IP address that is bound to the endpoint changes. This change causes a network interruption of 30 seconds or less, and Elastic Compute Service (ECS) instances located in the classic network can no longer connect to your ApsaraDB RDS instance over an internal network. To facilitate a smooth migration, ApsaraDB RDS provides the hybrid access solution.

Hybrid access refers to the ability of your ApsaraDB RDS instance to be connected by both ECS instances located in the classic network and ECS instances located in a VPC. During the validity period of the hybrid access solution, ApsaraDB RDS retains the internal classic network endpoint and generates an internal VPC endpoint. This prevents network interruptions when you migrate your instance from the classic network to a VPC.

For security and performance purposes, we recommend that you use only the internal VPC endpoint. You must specify a validity period for the hybrid access solution. When the validity period expires, ApsaraDB RDS releases the internal classic network endpoint and applications are unable to use the endpoint to connect to your instance. Therefore, you must add the internal VPC endpoint to your applications before the validity period expires. This ensures a smooth migration and prevents interruptions to your workloads.

For example, assume that a company uses the hybrid access solution to migrate its ApsaraDB RDS instance from the classic network to a VPC. During the validity period of the hybrid access solution, some applications use the internal VPC endpoint to connect to the ApsaraDB RDS instance, whereas the others continue to use the internal classic network endpoint to connect to the instance. When all applications of the company can use the internal VPC endpoint to connect to the instance, the internal classic network endpoint can be released. The following figure demonstrates the scenario.



Limits

During the validity period of the hybrid access solution, your ApsaraDB RDS instance has the following limits:

- The network type of the instance cannot be changed to classic network.
- The instance cannot be migrated to another zone.

Prerequisites

- The ApsaraDB RDS instance resides in the classic network.
- Available VPCs and vSwitches exist in the zone where the ApsaraDB RDS instance resides.
- Your ApsaraDB RDS instance provides an internal endpoint. If no internal endpoint exists, you must apply for one. For more information, see Apply for and release an internal endpoint or a public endpoint for an instance.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. On the Instance Connection tab, click **Switch to VPC**.
5. In the Switch to VPC dialog box, select a VPC and a vSwitch and specify whether to retain the classic network endpoint.

   Clear or select the **Reserve Original Classic Network Endpoint** check box based on the details described in the following table.

Action	Description
Clear the Reserve Original Classic Network Endpoint check box	The classic network endpoint is not retained and changes to a VPC endpoint. When you change the network type from classic network to VPC, a network interruption of 30 seconds occurs. When this occurs, ECS instances located in the classic network are disconnected from your ApsaraDB RDS instance.
Select the Reserve Original Classic Network Endpoint check box	The classic network endpoint is retained, and a new VPC endpoint is generated. In this case, your ApsaraDB RDS instance runs in hybrid access mode. Both ECS instances located in the classic network and ECS instances located in the selected VPC can access your ApsaraDB RDS instance over an internal network. When you change the network type from classic network to VPC, no network interruptions occur. ECS instances located in the classic network are still connected with your ApsaraDB RDS instance until the classic network endpoint expires. Specify the expiration date of the classic network endpoint. Before the classic network endpoint expires, you must add the new VPC endpoint to your applications that run on the ECS instances located in the selected VPC. This allows ApsaraDB RDS to migrate your workloads to the selected VPC without network interruptions.

6. Add the internal IP addresses of ECS instances located in the selected VPC to an IP address whitelist of the VPC network type. This allows the ECS instances to connect to your ApsaraDB RDS instance over an internal network. If no IP address whitelists of the VPC network type are available, create one. For more information, see Configure a whitelist.

Change the expiration date of the internal classic network endpoint

During the validity period of the hybrid access solution, you can change the expiration date of the classic network endpoint based on your business requirements. The expiration date is immediately recalculated starting from the day when you make the change. For example, assume that the classic network endpoint is configured to expire on August 18, 2017. On August 15, 2017, you increase the validity period of the classic network endpoint by 14 days. In this case, ApsaraDB RDS releases the classic network endpoint on August 29, 2017.

To change the expiration date, perform the following operations:

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. Click **Change Expiration Time**.
5. In the **Change Expiration Time** dialog box, select an expiration date and click **OK**.

9.1.7.5. Change the network type of an instance

This topic describes how to change the network type of an ApsaraDB RDS instance between classic network and Virtual Private Cloud (VPC).

Context

- Classic network: ApsaraDB RDS instances in the classic network are not isolated. Unauthorized access to these instances can be blocked only by IP address whitelists.
- VPC: Each VPC is an isolated virtual network. We recommend that you select the VPC type because it is more secure than the classic network.

  You can configure route tables, CIDR blocks, and gateways in a VPC. To smoothly migrate applications to the cloud, you can use the leased line or VPN method to create a virtual data center that consists of your data center and a VPC.

Change the network type from VPC to classic network

Precautions

- After you change the network type from VPC to classic network, the internal endpoint of your ApsaraDB RDS instance remains unchanged. However, the IP address that is associated with the internal endpoint changes.
- After you change the network type from VPC to classic network, Elastic Compute Service (ECS) instances located in the same VPC as your ApsaraDB RDS instance can no longer connect to your ApsaraDB RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- When you change the network type, a network interruption of 30 seconds may occur. To avoid business interruption, change the network type during off-peak hours or make sure that your application is configured to automatically reconnect to the instance.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. In the upper-right corner of the Database Connection section, click **Switch to Classic Network**.
5. In the message that appears, click **OK**.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
5. In the Switch to VPC dialog box, select a VPC and a vSwitch, and then select or clear **Reserve Original Classic Network Endpoint**. Click OK. For more information about **Reserve Original Classic Network Endpoint**, see Hybrid access from both the classic network and VPCs.

9.1.7.6. Change the VPC and vSwitch for an instance

This topic describes how to change the virtual private cloud (VPC) and vSwitch for an ApsaraDB RDS instance.

Prerequisites

The instance is deployed in a VPC.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.

4. In the upper-right corner of the Database Connection section, click **Switch vSwitch**.
5. Select a VPC and a vSwitch, and then click **OK**.
6. In the message that appears, click **OK**.

> **Note**
> - A network interruption of 30 seconds may occur when you switch the VPC and vSwitch of an ApsaraDB RDS instance. Make sure that your application is configured to automatically reconnect to the instance.
> - We recommend that you clear the cache immediately after the instance is switched to a new VPC and vSwitch. Otherwise, data can be read but not written.

9.1.8. Database proxy

9.1.8.1. Configure dedicated proxy

This topic describes the dedicated proxy feature provided by ApsaraDB RDS. The dedicated proxy feature provides advanced features such as read/write splitting, connection pooling, and transaction splitting.

Context

The dedicated proxy feature uses dedicated computing resources. This feature has the following benefits:

- A unified proxy endpoint is provided to connect to all the dedicated proxies that are enabled on your ApsaraDB RDS instance. This reduces maintenance costs by eliminating the need to update the endpoints on your application. The proxy endpoint remains valid until you release the dedicated proxies. For example, you may enable read/write splitting during peak hours, and then release read-only instances and disable read/write splitting after peak hours. In these cases, you do not need to update the endpoints on your application because the proxy endpoint remains connected.
- Dedicated proxies serve your ApsaraDB RDS instance and its read-only instances exclusively. You do not need to compete with other users for resources. This ensures service stability.
- Dedicated proxies are scalable. You can add dedicated proxies based on your business requirements to handle more workloads.

Limits

- Dedicated proxies do not support Secure Sockets Layer (SSL) encryption.
- Dedicated proxies do not support compression protocols.

Precautions

- When you change the specifications of your ApsaraDB RDS instance or its read-only instances, a network interruption may occur.
- If you connect your application to the proxy endpoint, all requests that are encapsulated in transactions are routed to your ApsaraDB RDS instance. This applies when the transaction splitting feature is not enabled.
- If a proxy endpoint is used to implement read/write splitting, read consistency cannot be ensured for the requests that are not encapsulated in transactions. If you require read consistency for these requests, you can encapsulate these requests in transactions.
- If a proxy endpoint is used for connection, the `SHOW PROCESSLIST` statement returns a result set for each query. The result set consists of the query results from the primary and read-only instances.
- If you execute multi-statements or stored procedures, the read/write splitting feature is disabled and all subsequent requests over the current connection are routed to the primary ApsaraDB RDS instance. To enable the read/write splitting feature again, you must close the current connection and establish a new connection.
- The dedicated proxy feature supports the `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints. However,

requests that contain hints have the highest route priorities and are not constrained by consistency or transaction limits. Before you use these hints, you must check whether these hints are suitable for your workloads. A hint cannot contain statements that change environment variables. An example is `/*FORCE_SLAVE*/ set names utf8;`. Otherwise, an error may occur in the subsequent procedure.

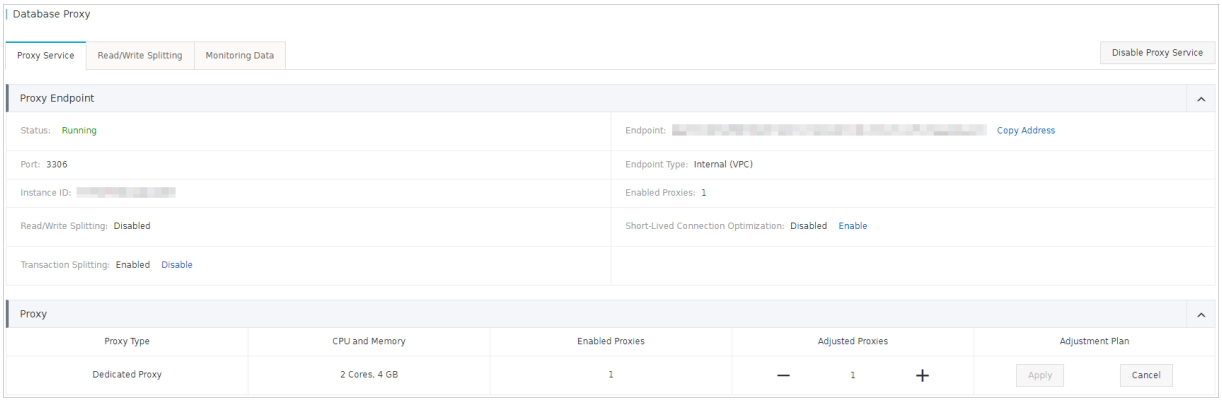
- After you enable the dedicated proxy feature, each connection is replicated to the primary ApsaraDB RDS instance and all of its read-only instances in compliance with the 1:N connection model. We recommend that you specify the same connection specifications for these instances. If these instances have different connection specifications, the number of connections allowed depends on the lowest connection specifications among these instances.
- If you create or restart a read-only instance after you enable the dedicated proxy feature, only the requests sent over new connections are routed to the new or restarted read-only instance.
- The **max_prepared_stmt_count** parameter must be set to the same value for the primary ApsaraDB RDS instance and all of its read-only instances.

Enable the dedicated proxy feature

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. Click **Enable now**.

Overview of the Proxy Service tab

When the dedicated proxy feature is enabled, you can use the generated proxy endpoint to implement features such as read/write splitting, connection pooling, and transaction splitting.



Section	Parameter	Description
	Instance ID	The ID of the primary ApsaraDB RDS instance.
	Enabled Proxies	The number of enabled dedicated proxies. You can enable more dedicated proxies to increase the maximum number of requests that can be processed. After public preview ends, you must pay for enabled proxies.
	Read/Write Splitting	Specifies whether to enable the read/write splitting feature for the proxy endpoint. For more information, see Read/write splitting.

Section	Parameter	Description
Proxy Endpoint	Short-Lived Connection Optimization	The type of connection pool for the proxy endpoint. This feature is suitable for scenarios where PHP short-lived connections are established. For more information, see Short-lived connection optimization. **Note** You can click **Enable** or **Disable** to the right of Short-Lived Connection Optimization to enable or disable this feature.
	Transaction Splitting	Specifies whether to enable the transaction splitting feature for the proxy endpoint. For more information, see Transaction splitting. **Note** You can click **Enable** or **Disable** to the right of Transaction Splitting to enable or disable this feature.
	Endpoint	The proxy endpoint that is generated when the dedicated proxy feature is enabled. This endpoint connects to all the dedicated proxies that are enabled on the ApsaraDB RDS instance. The read/write splitting feature is also bound to this endpoint. **Note** You can click **Copy Address** to the right of Endpoint to copy the endpoint.
	Port	The port that is used to connect to the proxy endpoint.
	Endpoint Type	The network type of the proxy endpoint.
Proxy	Proxy Type	The type of proxy that is enabled. Only **Dedicated Proxy** is supported.
	CPU and Memory	The CPU and memory specifications of the dedicated proxies. Only 2 Cores, 4 GB is supported.
	Enabled Proxies	The number of dedicated proxies that are enabled on the primary ApsaraDB RDS instance. Up to 60 dedicated proxies are supported. **Note** We recommend that you use the following formula to determine the number of dedicated proxies to specify: (Total number of CPU cores of your ApsaraDB RDS instance and its read-only instances)/8, rounded up to the nearest integer. For example, if your ApsaraDB RDS instance has 8 CPU cores and its read-only instances have 4 CPU cores, the recommended number of dedicated proxies is 2, as calculated in the following formula: ⌈(8 + 4)/8⌉ = 2.

Adjust the number of dedicated proxies

Note When you adjust the number of dedicated proxies, a network interruption may occur. Make sure that your application is configured to automatically reconnect to the instance.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. In the **Proxy** section of the Proxy Service tab, change the number in the **Adjusted Proxies** column and click **Apply** in the **Adjustment Plan** column.
5. In the Configure Proxy Resources dialog box, select **Migrate Immediately** to apply the change. You can also select **Next Maintenance Period** to set a maintenance window for the change to take effect. Click **OK**.

View the monitoring data of dedicated proxies

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. Click the **Monitoring Data** tab.
5. Select a time range to view the **CPU Utilization** metric within that time range.

Disable the dedicated proxy feature

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. In the upper-right corner of the page, click **Disable Proxy Service**.
5. In the message that appears, click **OK**.

9.1.8.2. Configure short-lived connection optimization

This topic describes the short-lived connection optimization feature provided by ApsaraDB RDS in its dedicated proxy feature.

Prerequisites

The database proxy feature is enabled for your ApsaraDB RDS instance. For more information, see Dedicated proxy.

Context

The short-lived connection optimization feature is used to reduce workloads on the ApsaraDB RDS instance caused by frequent short-lived connections. When a client is disconnected, the system checks whether the closed connection is idle. If the connection is considered idle, the dedicated proxy retains the connection in the connection pool for a short period of time. When the client initiates a request for access to your instance again, the dedicated proxy searches the connection pool for an idle connection that matches the request. The connection pool is matched based on the values of the user, clientip, and dbname fields in the request. If the dedicated proxy finds an idle connection that matches the request, it reuses the matched idle connection. If no idle connection can be matched, a new connection is established with your instance to reduce database connection overheads.

> **Note** The short-lived connection optimization feature does not reduce the number of concurrent connections with the instance. It decreases the frequency at which connections are established between an application and your instance to reduce overheads of the primary MySQL thread and improve efficiency to process business requests. However, idle connections in the connection pool still occupy the database threads for a short period of time.

Precautions

You cannot configure different permissions for different source IP addresses by using the same account. Otherwise, errors may occur when connections in the connection pool are reused. For example, if a user account has permissions on database_a when its source IP address is 192.168.1.1 but does not have permissions on database_a when its source IP address is 192.168.1.2, the short-lived connection optimization feature may encounter permission errors.

Enable short-lived connection optimization

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. On the **Proxy Service** tab, click **Enable** to the right of **Short-Lived Connection Optimization**.

9.1.8.3. Configure transaction splitting

This topic describes the transaction splitting feature provided by the dedicated proxy of ApsaraDB RDS. This feature identifies and distributes read requests initiated before write requests within a transaction to read-only instances. This reduces workloads on the primary instance.

Prerequisites

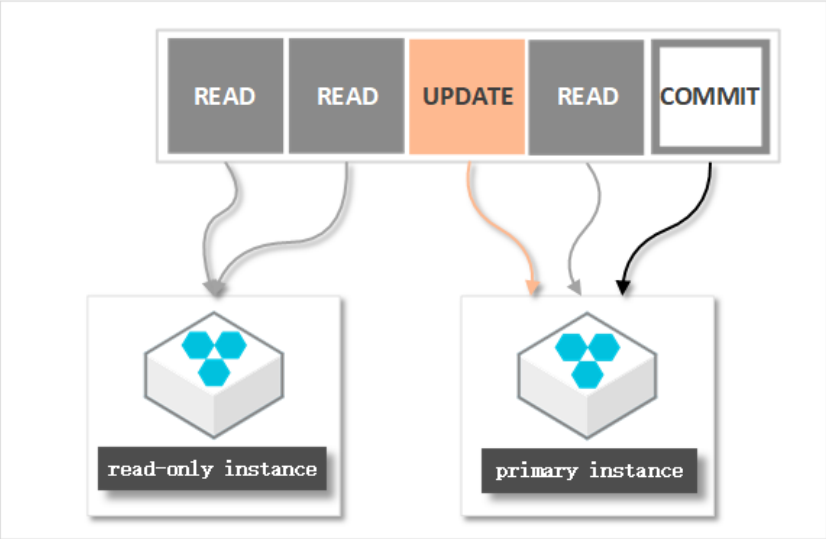
The dedicated proxy feature is enabled for your ApsaraDB RDS instance. For more information, see Dedicated proxy.

Context

By default, the dedicated proxy sends all requests in transactions to the primary instance to ensure the correctness of the transactions. If the framework encapsulates all requests in transactions, the primary instance becomes heavily loaded. In this case, you can enable the transaction splitting feature.

When transaction splitting is enabled and the default isolation level READ COMMITTED is used, the ApsaraDB RDS instance starts a transaction only for write requests when autocommit is disabled (set autocommit=0). Read requests that arrive before the transaction is started are distributed to read-only instances by the load balancer.

> **Note**
>
> - Explicit transactions do not support splitting, such as transactions started by using the BEGIN or START statement.
> - After you enable the transaction splitting feature, global consistency cannot be ensured. Before you enable this feature, we recommend that you evaluate whether this feature is suitable for your workloads.



Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. On the **Proxy Service** tab, click **Enable** to the right of **Transaction Splitting**.

> Note
> - When you no longer need transaction splitting, you can click **Disable** to the right of **Transaction Splitting**.
> - The operation to enable or disable transaction splitting takes effect only on new connections.

9.1.8.4. Read/write splitting

9.1.8.4.1. Enable read/write splitting

This topic describes the read/write splitting feature. This feature allows ApsaraDB RDS to route read and write requests to the primary and read-only instances based on the dedicated proxy endpoint (also called read/write splitting endpoint).

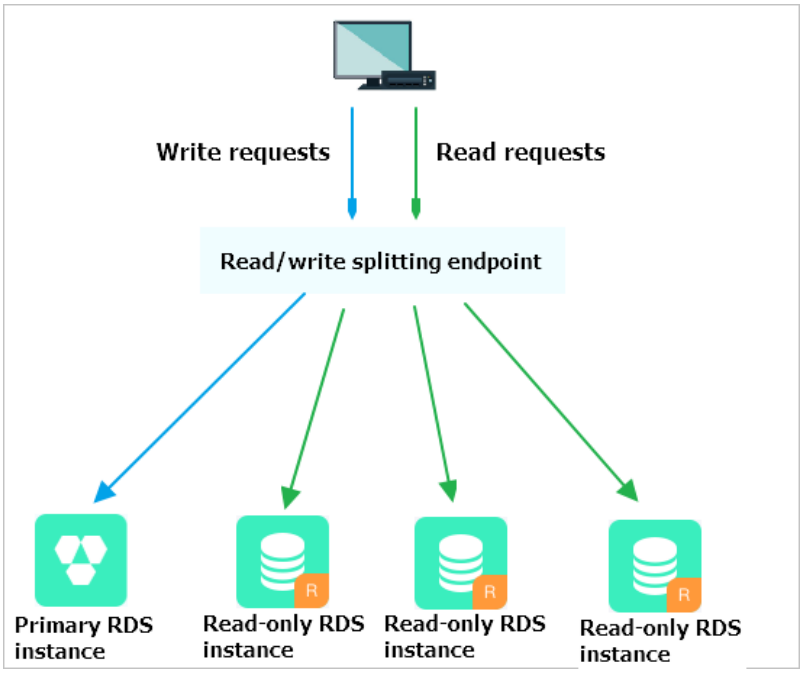
Prerequisites

- The database proxy or dedicated proxy feature is enabled. For more information, see Enable the dedicated proxy feature.
- At least one read-only instance is created. For more information about how to create a read-only instance, see Create a read-only instance.

Context

If your database system processes a large number of read requests and a small number of write requests, a single primary ApsaraDB RDS instance may fail to efficiently process the read requests. This may interrupt your workloads. In this case, you can create one or more read-only ApsaraDB RDS instances to offload read requests from the primary instance and increase the read capability of your database system. For more information, see Create a read-only instance.

After you create read-only instances, you can enable read/write splitting. In this case, a read/write splitting endpoint is provided. After you add the endpoint to your application, write requests are routed to the primary instance and read requests are routed to the read-only instances.



Differences between the read/write splitting endpoint and the internal and public endpoints

After you enable read/write splitting and add the read/write splitting endpoint to your application, all requests are first routed to this endpoint, and then to the primary and read-only instances based on the request types and the read weights of these instances.

If the internal or public endpoint of the primary instance is added to your application, all requests are routed to the primary instance. To implement read/write splitting, you must add the endpoints and read weights of the primary and read-only instances to your application.

Logic to route requests

- The following requests are routed only to the primary instance:
  - Requests for DML statements such as INSERT, UPDATE, DELETE, and SELECT FOR UPDATE
  - Requests for DDL statements used to perform operations such as creating databases or tables, deleting databases or tables, and changing schemas or permissions
  - All requests that are encapsulated in transactions
  - Requests for user-defined functions
  - Requests for stored procedures
  - Requests for EXECUTE statements
  - Requests for multi-statements
  - Requests that involve temporary tables
  - Requests for SELECT last_insert_id() statements
  - All requests to query or modify user environment variables
  - Requests for SHOW PROCESSLIST statements
  - All requests for KILL statements in SQL (not KILL commands in Linux)
- The following requests are routed to the primary instance or its read-only instances:
  - Read requests that are not encapsulated in transactions

- Requests for COM_STMT_EXECUTE statements

- The following requests are routed to all the primary and read-only instances:
  - All requests to modify system environment variables
  - Requests for USE statements
  - Requests for COM_STMT_PREPARE statements
  - Requests for COM_CHANGE_USER, COM_QUIT, and COM_SET_OPTION statements

Benefits

- Easier maintenance by using a unified endpoint

  If you do not enable the read/write splitting feature, you must add the endpoints of the primary and read-only instances to your application. This way, your database system routes write requests to the primary instance and read requests to the read-only instances.

  If you enable the read/write splitting feature, you can use a dedicated proxy endpoint to implement read/write splitting. After your application is connected to this endpoint, your database system routes read and write requests to the primary and read-only instances based on the read weights of these instances. This reduces maintenance costs.

  You can also create read-only instances to improve the read capability of your database system. You do not need to modify the configuration data on your application.

- Higher performance and lower maintenance costs by using a native link

  You can build your own proxy layer on the cloud to implement read/write splitting. In this case, data needs to be parsed and forwarded by multiple components before the data reaches your database system. As a result, response latencies increase. The read/write splitting feature is built in the ApsaraDB RDS ecosystem and can efficiently reduce response latencies, increase processing speeds, and reduce maintenance costs.

- Ideal in various use scenarios based on configurable read weights and thresholds

  You can specify the read weights of the primary and read-only instances. You can also specify the latency threshold for data replication to the read-only instances.

- High availability based on instance-level health checks

  The read/write splitting feature enables ApsaraDB RDS to actively check the health status of the primary and read-only instances. If a read-only instance unexpectedly breaks down or its data replication latency exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. ApsaraDB RDS redirects the read requests that are destined for the faulty read-only instance to healthy instances in your database system. This ensures service availability in the event of faults on individual read-only instances. After the faulty read-only instance is recovered, ApsaraDB RDS resumes routing read requests to the instance.

  > **Note** To avoid single points of failure (SPOFs), we recommend that you create at least two read-only instances.

Precautions

- When you change the specifications of your ApsaraDB RDS instance or its read-only instances, a network interruption may occur.
- After you create a read-only instance, only the requests over new connections can be routed to the read-only instance.
- The dedicated proxy endpoint does not support SSL encryption.
- The dedicated proxy endpoint does not support compression.
- If a dedicated proxy endpoint is used to connect to your database system, all the requests that are encapsulated in transactions are routed to the primary instance.
- If a dedicated proxy endpoint is used to implement read/write splitting, the read consistency of the requests that are not encapsulated in transactions cannot be ensured. If you require read consistency for these requests,

you can encapsulate these requests in transactions.

- If a dedicated proxy endpoint is used for connection, the `SHOW PROCESSLIST` statement returns a result set for each query. The result set consists of the query results from the primary and read-only instances.
- If the short-lived connection optimization feature is enabled, the `SHOW PROCESSLIST` statement may return idle connections.
- If you execute multi-statements or stored procedures, the read/write splitting feature is disabled and all the subsequent requests over the current connection are routed to the primary ApsaraDB RDS instance. To enable the read/write splitting feature again, you must close the current connection and establish a new connection.
- The dedicated proxy feature supports the `/*FORCE_MASTER*/` and `/*FORCE_SLAVE*/` hints. However, requests that contain hints have the highest route priorities and are not constrained by consistency or transaction limits. Before you use these hints, you must check whether these hints are suitable for your workloads. A hint cannot contain statements that change environment variables. An example is `/*FORCE_SLAVE*/ set names utf8;`. Otherwise, an error may occur in the subsequent procedure.

Prerequisites

A read-only instance is created for the primary instance. For more information, see Create a read-only instance.

Enable read/write splitting

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. On the **Read/Write Splitting** tab, click **Enable now**.
5. Configure the following parameters.

Parameter	Description
Latency Threshold	The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the latency of data replication to a read-only instance exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. This applies even if the instance has a high read weight. Valid values: 0 to 7200. Unit: seconds. The read-only instances may replicate data from the primary instance at a specific latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.
Read Weight Distribution	The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, assume that your primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this case, your primary instance processes only write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio. ◦ **Automatic Distribution**: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, your database system assigns a read weight to the read-only instance and adds the read-only instance to the read/write splitting link. ◦ **Customized Distribution**: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, ApsaraDB RDS sets the read weight of the read-only instance to 0. You must manually modify the read weight of the created read-only instance.

6. Click **OK**.

9.1.8.4.2. Configure read/write splitting

This topic describes how to configure the latency threshold and specify read weights for an ApsaraDB RDS instance in the ApsaraDB RDS console.

Prerequisites

Read/write splitting is enabled. For more information, see Enable read/write splitting.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. On the **Read/Write Splitting** tab, click **Configure Read/Write Splitting**.
5. Configure the following parameters.

Parameter	Description
Latency Threshold	The maximum latency that is allowed for data replication from the primary instance to its read-only instances. If the latency of data replication to a read-only instance exceeds the specified threshold, ApsaraDB RDS stops routing read requests to the instance. This applies even if the instance has a high read weight. Valid values: 0 to 7200. Unit: seconds. The read-only instances may replicate data from the primary instance at a specific latency due to SQL statement execution limits. We recommend that you set this parameter to a value that is greater than or equal to 30.
Read Weight Distribution	The read weight of each instance in your database system. A higher read weight indicates more read requests to process. For example, assume that your primary instance is attached with three read-only instances, and the read weights of the primary and read-only instances are 0, 100, 200, and 200. In this case, your primary instance processes only write requests, and the three read-only instances process all of the read requests at the 1:2:2 ratio. ◦ **Automatic Distribution**: Your database system assigns a read weight to each instance based on the instance specifications. After you create a read-only instance, your database system assigns a read weight to the read-only instance and adds the read-only instance to the read/write splitting link. ◦ **Customized Distribution**: You must manually specify the read weight of each instance. Valid values: 0 to 10000. After you create a read-only instance, ApsaraDB RDS sets the read weight of the read-only instance to 0. You must manually modify the read weight of the created read-only instance.

6. Click **OK**.

9.1.8.4.3. Disable read/write splitting

This topic describes how to disable the read/write splitting feature of an ApsaraDB RDS instance in the ApsaraDB RDS console.

Prerequisites

Read/write splitting is enabled. For more information, see Enable read/write splitting.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Proxy**.
4. On the **Read/Write Splitting** tab, click **Disable Read/Write Splitting**.

5. In the message that appears, click **Confirm**.

9.1.9. Monitoring and alerts

9.1.9.1. View resource and engine monitoring data

The ApsaraDB RDS console provides a variety of performance metrics to monitor the status of your instances.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Monitoring and Alerts**.
4. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Monitoring type	Metric	Description
Resource Monitoring	**Disk Space (MB)**	The disk space usage of the instance. It consists of the following items: ○ Instance size ○ Data usage ○ Log size ○ Temporary file size ○ Other system file size Unit: MB.
	IOPS (Input/Output Operations per Second)	The number of input/output operations per second (IOPS) of the instance.
	Total Connections	The number of active connections to the instance and the total number of connections to the instance.
	CPU Utilization and Memory Usage (%)	The CPU utilization and memory usage of the instance. These metrics do not include the CPU utilization and memory usage for the operating system.
	Network Traffic (KB)	The inbound and outbound traffic of the instance per second. Unit: KB.
	Transactions per Second (TPS)/Queries per Second (QPS)	The average number of transactions per second (TPS) and the average number of SQL statements executed per second.
	InnoDB Buffer Pool Read Hit Ratio, Usage Ratio, and Dirty Block Ratio (%)	The read hit ratio, usage ratio, and dirty block ratio of the InnoDB buffer pool.
	InnoDB Read/Write Volume (KB)	The amount of data that InnoDB reads and writes per second. Unit: KB.
	InnoDB Buffer Pool Read/Write Frequency	The number of read and write operations that InnoDB performs per second.

Monitoring type	Metric	Description
Engine Monitoring	**InnoDB Log Read/Write/fsync**	The average frequency of physical writes to log files per second by InnoDB, the frequency of log write requests, and the average frequency of fsync writes to log files.
	Temporary Tables Automatically Created on Hard Disk when MySQL Statements Are Executed	The number of temporary tables that are automatically created on the hard disk when the database executes SQL statements.
	MySQL_COMDML	The number of SQL statements that the database executes per second. The following SQL statements are included: ○ Insert ○ Delete ○ Insert_Select ○ Replace ○ Replace_Select ○ Select ○ Update
	MySQL_RowDML	The numbers of operations that InnoDB performs per second. The following items are included: ○ The number of physical writes to log files per second ○ The number of rows that are read, updated, deleted, and inserted from InnoDB tables per second
	MyISAM Read/Write Frequency	The numbers of operations that MyISAM performs per second. The following items are included: ○ The number of MyISAM reads and writes from the buffer pool per second ○ The number of MyISAM reads and writes from the hard disk per second
	MyISAM Key Buffer Read/Write/Usage Ratio (%)	The read hit ratio, write hit ratio, and usage of the MyISAM key buffer per second.

9.1.9.2. Set a monitoring frequency

This topic describes how to set a monitoring frequency for an ApsaraDB RDS instance.

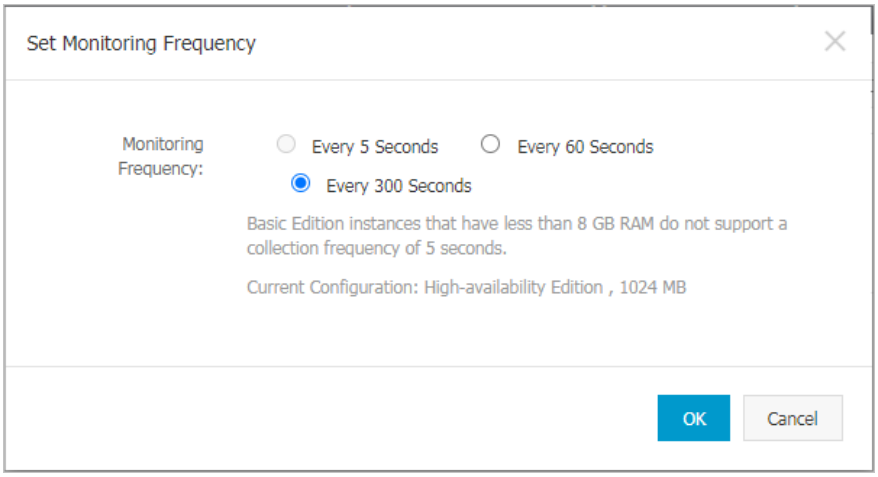
Context

ApsaraDB RDS provides the following monitoring frequencies:

- Every 5 seconds for the first seven days. After the seven days, performance metrics are monitored every 60 seconds.
- Every 60 seconds.
- Every 300 seconds.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Monitoring and Alerts**.
4. On the **Monitoring** tab, click **Set Monitoring Frequency**.
5. In the **Set Monitoring Frequency** dialog box, select a new monitoring frequency.



> **Note** If an ApsaraDB RDS instance runs the RDS Basic Edition or its memory capacity is less than 8 GB, the **Every 5 Seconds** monitoring frequency is not supported.

6. Click **OK**.

9.1.10. Data security

9.1.10.1. Configure an IP address whitelist for an ApsaraDB RDS instance

After you create an ApsaraDB RDS instance, you must add the IP addresses or CIDR blocks that are used for database access to the IP address whitelist of the instance to ensure database security and reliability.

Context

IP address whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you maintain your IP address whitelists on a regular basis.

To configure a whitelist, you can perform the following operations:

- Configure an IP address whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.
- Configure an Elastic Compute Service (ECS) security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Precautions

- The default IP address whitelist can be modified or cleared, but cannot be deleted.
- You can add up to 1,000 IP addresses or CIDR blocks to a whitelist. If you want to add a large number of IP addresses, we recommend that you merge them into CIDR blocks, such as 192.168.1.0/24.

Introduction to IPv6

IPv4 addresses are widely used, but the limited number of IPv4 addresses restricts the development of the Internet. Compared with IPv4 addresses, IPv6 addresses are more sufficient and allow more types of devices to access the Internet. ApsaraDB RDS supports both IPv4 and IPv6 addresses.

The following table describes the differences between IPv4 and IPv6.

Item	IPv4	IPv6
Address length	32 bits (4 bytes)	128 bits (16 bytes)
Number of addresses	2^32	2^128
Address format	xxx.xxx.xxx.xxx Where xxx is a decimal number that can range from 0 to 255. Each x is a decimal integer, and leading zeros can be omitted. Example: 192.168.1.1	xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx Where each x is a hexadecimal number, and leading zeros can be omitted. You can use a double colon (::) once in an IPv6 address to indicate a series of zeros. Example: CDDC:0000:0000:0000:8475:1111:3900:2020
Address Resolution Protocol (ARP)	Uses broadcast ARP Request frames to resolve an IP address to a link layer address.	Uses multicast neighbor solicitation messages to resolve an IP address to a link layer address.
Security	Implements a security mechanism based on applications and cannot provide protections at the IP layer.	Supports packet fragmentation to ensure data confidentiality and integrity and provides security at the IP layer.
LAN connection	Connects to LANs by using network interfaces.	Can work with Ethernet adapters and is supported over virtual Ethernet networks between logical partitions.
Address type	• Unicast address • Multicast address • Broadcast address	• Unicast address • Multicast address • Anycast address

Create an IP address whitelist

Each IP address whitelist of an ApsaraDB RDS instance can contain **IPv4** or **IPv6** addresses. By default, the system provides an IP address whitelist of the **IPv4** type. If you want an IP address whitelist of the **IPv6** type, manually create one.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Create Whitelist**. In the dialog box that appears, configure the following parameters.

Parameter	Description

Parameter	Description
Whitelist Name	The name of the IP address whitelist. **Note** ◦ The name can contain lowercase letters, digits, and underscores (_). ◦ The name must start with a lowercase letter and end with a lowercase letter or digit. ◦ The name must be 2 to 32 characters in length.
IP Type	The IP type of the IP address whitelist. Valid values: ◦ **IPv4** ◦ **IPv6** **Note** For more information about the differences between IPv4 and IPv6, see the "Introduction to IPv6" section of this topic.
IP Addresses	The IP addresses that are allowed to access the instance.

Configure an IP address whitelist

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. On the **Whitelist Settings** tab, click **Edit** corresponding to an IP address whitelist.

   Note If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.

5. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance and click **OK**.

> **Note**
>
> - Limits for **IPv4** addresses:
>   - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.
>
>   Supported formats are `0.0.0.0/0`, IP addresses such as `10.23.12.24`, or CIDR blocks such as `10.23.12.24/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits.
>   - If an IP address whitelist is empty or contains `0.0.0.0/0`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
> - Limits for **IPv6** addresses:
>   - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.
>
>   Supported formats are `::`, IP addresses such as `0:0:0:0:0:0:0:1`, or CIDR blocks such as `0:0:0:0:0:0:0:1/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 128 bits.
>   - If an IP address whitelist is empty or contains only `::`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
> - You cannot specify both **IPv4** and **IPv6** addresses in a single IP address whitelist. If you want to specify both IPv4 and IPv6 addresses, specify them in separate IP address whitelists.
> - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the ECS instances that are created within your Apsara Stack tenant account appear. Then, you can select the IP addresses and add them to an IP address whitelist.

9.1.10.2. Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates that are issued by certificate authorities (CAs) to the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. However, SSL increases the response time.

Prerequisites

Your ApsaraDB RDS instance runs one of the following MySQL versions and RDS editions:

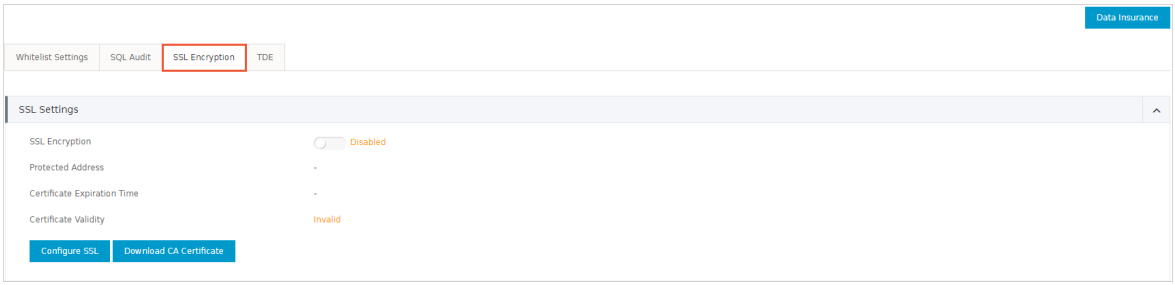
- MySQL 8.0 on RDS High-availability Edition (with local SSDs)
- MySQL 5.7 on RDS High-availability Edition (with local SSDs)
- MySQL 5.6 on RDS High-availability Edition (with local SSDs)

Precautions

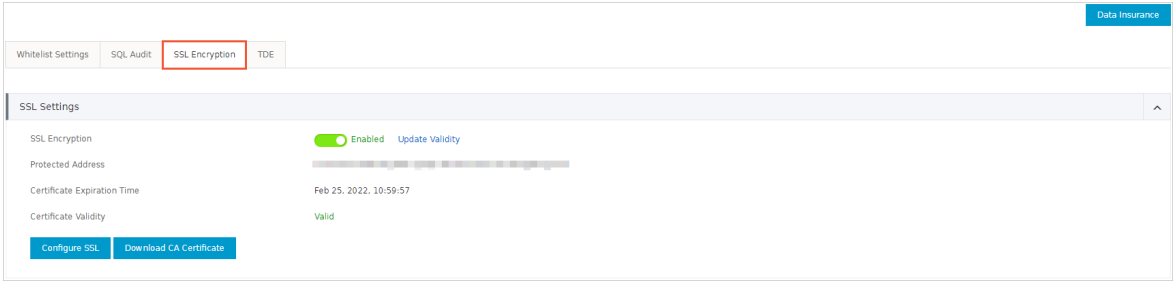
- An SSL CA certificate is valid for one year. You must update the validity period of the SSL CA certificate in your application or client within one year. Otherwise, your application or client that uses encrypted network connections cannot connect to the ApsaraDB RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- Read/write splitting endpoints do not support SSL encryption.
- If you disable SSL encryption, the ApsaraDB RDS instance restarts. Proceed with caution.

Enable SSL encryption

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **SSL Encryption** tab.



5. In the **SSL Settings** section, turn on **SSL Encryption**.
6. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
7. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.



The downloaded package contains the following files:

- P7B file: contains the server CA certificate that can be imported into a Windows operating system.
- PEM file: contains the server CA certificate that can be imported into an operating system other than Windows or an application that is not Windows-based.
- JKS file: contains the server CA certificate that is stored in a Java-supported truststore. You can use the file to import the CA certificate chain into a Java-based application. The default password is apsaradb.

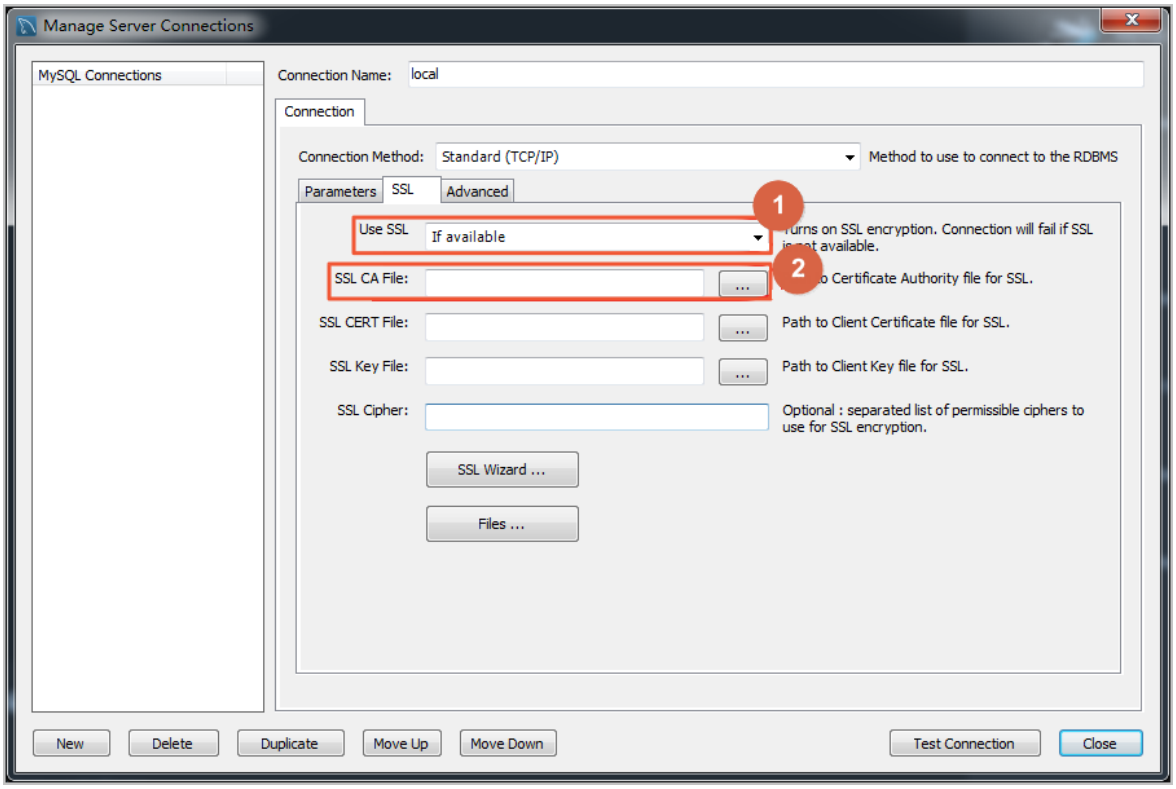
> **Note** When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides and modify the following configurations:
>
> ```
> jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
> jdk.certpath.disabledAlgorithms=MD2, RSA keySize < 1024
> ```
>
> If you do not modify the JDK security configuration, the following error is reported. Similar errors are also caused by the Java security configuration.
>
> ```
> javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
> ```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the ApsaraDB RDS instance. This section describes how to configure an SSL CA certificate. MySQL Workbench and Navicat are used in the example. If you are using other applications or clients, see the related instructions.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. In the **Connection** section, click the **SSL** tab and configure the following parameters.



①: Enable **Use SSL**.

②: Import the SSL CA certificate file.

Configure a certificate on Navicat

1. Start Navicat.
2. Right-click the database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the PEM-formatted CA certificate, as shown in the following figure.
4. Click **OK**.

> **Note** If the `connection is being used` error is reported, the previous session is still connected. Restart Navicat.

5. Double-click the database to test whether the database is connected.

Update the validity period of an SSL CA certificate

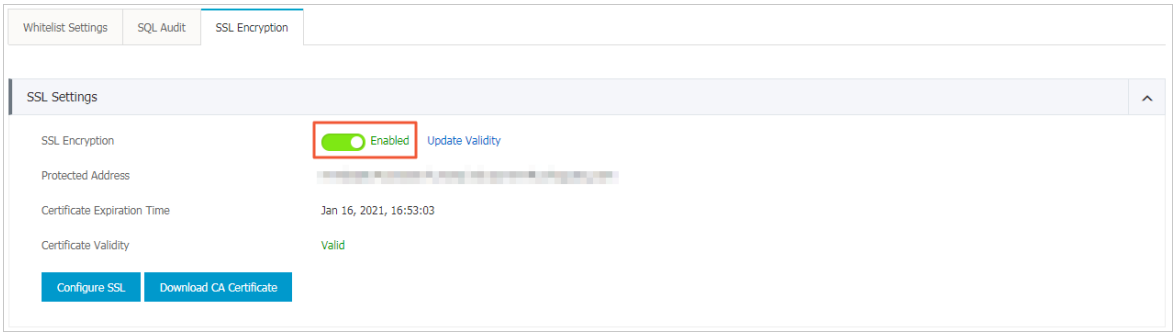
> **Note** **Update Validity** causes the ApsaraDB RDS instance to restart. Proceed with caution.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **SSL Encryption** tab.
5. Click **Update Validity**.

Disable SSL encryption

> **Note**
>
> - If you disable SSL encryption, the ApsaraDB RDS instance restarts. To reduce the impact on your business, the system triggers a primary/secondary switchover. We recommend that you disable SSL encryption during off-peak hours.
> - After you disable SSL encryption, access performance increases, but security decreases. We recommend that you disable SSL encryption only in secure environments.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **SSL Encryption** tab.
5. In the **SSL Settings** section, turn off **SSL Encryption**. In the message that appears, click **OK**.



9.1.10.3. Configure TDE

This topic describes how to configure Transparent Data Encryption (TDE) for an ApsaraDB RDS instance. TDE encrypts and decrypts data files in real time. It encrypts data files when they are written to disks, and decrypts data files when they are loaded to the memory from disks. TDE does not increase the size of data files. You can use TDE without the need to make changes to applications.

Prerequisites

- Your ApsaraDB RDS instance runs the RDS High-availability Edition with local SSDs.
- Key Management Service (KMS) is activated. If KMS is not activated, you can activate it when you enable TDE.

Context

The key used for TDE is created and managed by KMS. ApsaraDB RDS does not provide the key or certificates that are required for encryption. For specific zones, you can use the keys that are automatically generated by Apsara Stack, or you can use your own key materials to generate data keys and authorize your ApsaraDB RDS instance to use these keys.

Precautions

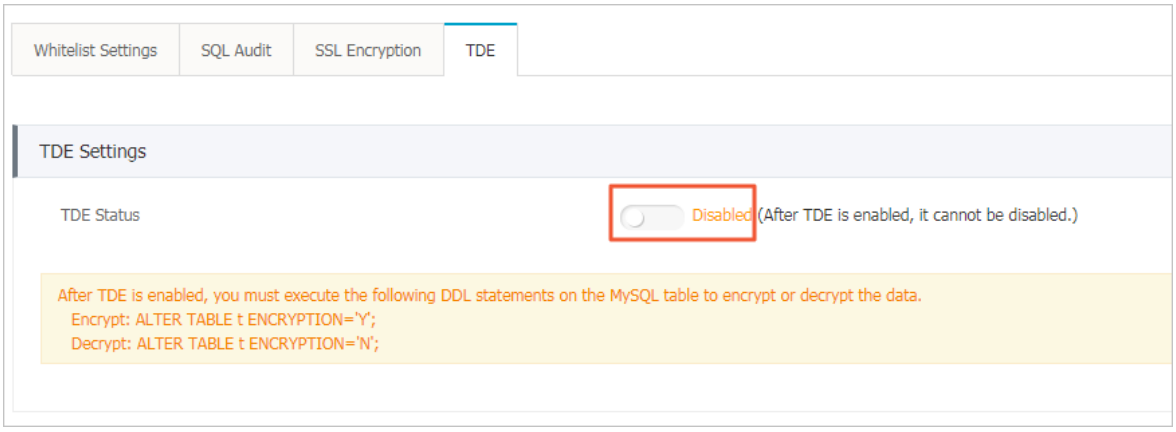
- When TDE is being enabled, your ApsaraDB RDS instance is restarted and all services are disconnected. Make appropriate service arrangements before you enable TDE. Proceed with caution.
- You cannot disable TDE after it is enabled.
- You cannot change the key used for encryption after TDE is enabled.
- If you want to restore the data to your computer after TDE is enabled, you must decrypt data on your ApsaraDB RDS instance. For more information, see the "Decrypt a table" section of this topic.
- After TDE is enabled, CPU utilization significantly increases.

- If you use an existing custom key for encryption, take note of the following items:
  - If you disable the key, configure a plan to delete the key, or delete the key material, the key becomes unavailable.
  - If you revoke the key that is authorized for an ApsaraDB RDS instance, the instance becomes unavailable after it is restarted.
  - You must use an Apsara Stack tenant account or an account that has the AliyunSTSAssumeRoleAccess permission.

> **Note** For more information, see topics about key management in *Key Management Service User Guide*.

Use a key that is automatically generated by Apsara Stack

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **TDE** tab.
5. In the **TDE Settings** section, turn on **TDE Status**.

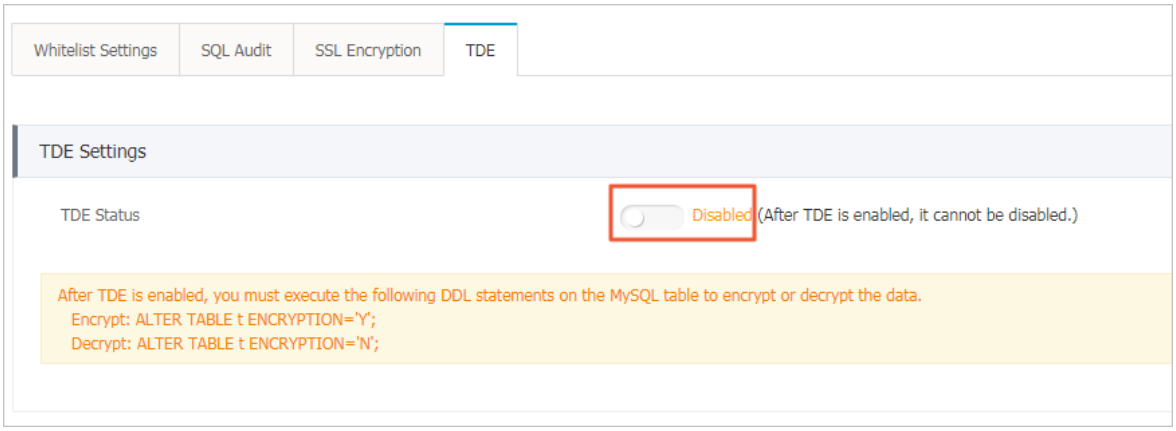


6. In the dialog box that appears, select **Use an Automatically Generated Key** and click **OK**.

> **Note** If the instance runs MySQL 5.7 on RDS High-availability Edition, you can select one of the following encryption methods:
>
> - SM4 encryption
> - AES_256_CBC encryption

Use an existing custom key

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **TDE** tab.
5. In the **TDE Settings** section, turn on **TDE Status**.



6. In the dialog box that appears, select **Use an Existing Custom Key** and click **OK**.

> **Note** If you do not have a custom key, click **create a key** to go to the KMS console and import the key materials. For more information, see Create a key in *Key Management Service User Guide*.

Encrypt a table

Log on to the database and execute one of the following statements to encrypt a table:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=encrypted;
```

- MySQL 5.7 or MySQL 8.0

```
alter table <tablename> encryption='Y';
```

Decrypt a table

Execute one of the following statements to decrypt a table that is encrypted by using TDE:

- MySQL 5.6

```
alter table <tablename> engine=innodb,block_format=default;
```

- MySQL 5.7 or MySQL 8.0

```
alter table <tablename> encryption='N';
```

FAQ

- Q: After I enable TDE, can I still use common database tools such as Navicat?

  A: Yes, after you enable TDE, you can still use common database tools such as Navicat.

- Q: After I enable TDE, why is my data still in plaintext?

  A: After you enable TDE, your data is stored in ciphertext. However, when the data is queried, it is decrypted and loaded into memory as plaintext. A: TDE encrypts backup files to prevent data leaks. Before you restore the data of your ApsaraDB RDS instance from an encrypted backup file to your computer, you must decrypt the file. For more information, see the "Decrypt a table" section of this topic.

9.1.10.4. Configure SQL audit

You can use the SQL audit feature to audit SQL executions and view their details. The SQL audit feature does not affect instance performance.

Context

> **Note** You cannot view the logs that are generated before you enable SQL audit.

You can view the incremental data of your ApsaraDB RDS for MySQL instance in SQL audit logs or binlogs. However, these two methods differ in the following aspects:

- SQL audit logs are similar to audit logs in MySQL and record all DML and DDL operations by using network protocol analysis. SQL audit does not parse the actual parameter values. Therefore, a small amount of information may be lost if a large number of SQL statements are executed to query data. The incremental data obtained by using this method may be inaccurate.
- Binlogs record all add, delete, and modify operations and the incremental data used for data restoration. Binlogs are temporarily stored in your ApsaraDB RDS instance after they are generated. The system transfers full binlog files to Object Storage Service (OSS) on a regular basis. OSS then stores the files for seven days. However, a binlog file cannot be transferred if data is being written to it. Such binlog files cannot be uploaded to OSS after you click **Upload Binlogs** on the **Backup and Restoration** page. Binlogs are not generated in real time, but you can obtain accurate incremental data from them.

Precautions

- By default, SQL audit is enabled.
- SQL audit logs are retained for 30 days.
- Log files exported from SQL audit are retained for two days. The system clears files that are retained for longer than two days.

Disable SQL audit

> **Note** If SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs to your computer before you disable SQL audit.

You can disable SQL audit to avoid charges when you do not need it. To disable SQL audit, perform the following operations:

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **SQL Audit** tab.
5. Click **Export File** to export and store the SQL audit content to your computer.
6. After the file is exported, click **Disable SQL Audit**.
7. In the message that appears, click **Confirm**.

Enable SQL audit

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Data Security**.
4. Click the **SQL Audit** tab.
5. Click **Enable SQL Audit**.
6. In the message that appears, click **Confirm**.

   After SQL audit is enabled, you can query SQL information based on conditions such as the time range, database, user, and keyword.

9.1.11. Service availability

9.1.11.1. Switch workloads over between primary and secondary ApsaraDB RDS instances

This topic describes how to switch workloads over between a primary ApsaraDB RDS instance and its secondary instance. ApsaraDB RDS supports both manual switchover and automatic switchover. After a switchover is complete, the primary ApsaraDB RDS instance becomes the secondary instance.

Context

- Automatic switchover: By default, the automatic switchover feature is enabled. If the primary ApsaraDB RDS instance becomes faulty, ApsaraDB RDS automatically switches workloads over to the secondary instance.
- Manual switchover: You can manually switch workloads over between the primary and secondary ApsaraDB RDS instances even when the automatic switchover feature is enabled.

> **Note** Data is synchronized in real time between the primary and secondary ApsaraDB RDS instances. You can access only the primary instance. The secondary instance serves only as a standby and does not allow external access.

Precautions

- You may encounter a network interruption during a switchover. Make sure that your application is configured to automatically reconnect to the instance.
- If the primary ApsaraDB RDS instance is attached with read-only instances, the read-only instances need to re-establish the connections that are used for data replication and synchronize incremental data after a switchover. As a result, data on the read-only instances shows latencies of a few minutes.

Perform a manual switchover

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Service Availability**.
4. Click **Switch Primary/Secondary Instance** on the right side of the page.

   > **Note** You may encounter a network interruption during a switchover. Make sure that your application is configured to automatically reconnect to the instance.

5. In the dialog box that appears, click **OK**.

   > **Note** In the dialog box, you can also select **Switch Within Maintenance Window** and click **OK**. Then, the system performs the primary/secondary switchover within the maintenance window. For more information about how to set the maintenance window, see Set a maintenance window. You can also click **Change** on the right to change the maintenance window.

FAQ

Q: Can I connect to secondary instances?

A: No, you cannot connect to secondary instances. You can connect only to primary instances. Secondary instances serve only as a standby and do not allow external access.

9.1.11.2. Change the data replication mode

You can set the data replication mode between primary and secondary ApsaraDB RDS instances to improve database availability.

Prerequisites

Your ApsaraDB RDS instance runs the RDS High-availability Edition.

Data replication modes

- Semi-synchronous

  After an update that is initialized by your application is complete on the primary instance, the log is synchronized to all the secondary instances. After the secondary instances receive the log, the update transaction is considered committed. Your database system does not need to wait for the log to be replayed.

  If the secondary instances are unavailable or a network exception occurs between the primary and secondary instances, semi-synchronous replication degrades to the asynchronous mode.

- Asynchronous

  When your application initiates a request to add, delete, or modify data, the primary instance responds to your application immediately after it completes the operation. At the same time, the primary instance starts to asynchronously replicate data to its secondary instances. During asynchronous data replication, the unavailability of secondary instances does not affect the operations on the primary instance. Data remains consistent even if the primary instance is unavailable.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Service Availability**.
4. Click **Change Data Replication Mode** on the right side of the page.
5. In the dialog box that appears, select a data replication mode and click **OK**.

FAQ

Q: Which data replication mode is recommended?

A: You can select a data replication mode based on your business requirements. If you require quick responses, we recommend that you select the asynchronous mode. In other scenarios, you can select the semi-synchronous mode.

9.1.12. Database backup and restoration

9.1.12.1. Configure automatic backup

Automatic backup of ApsaraDB RDS supports full physical backups. ApsaraDB RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Backup and Restoration**.
4. Click the **Backup Settings** tab.
5. Click **Edit**. In the dialog box that appears, configure the following parameters.

> **Note** To ensure data security, the system compares the new backup cycle and time with the original settings and selects the most recent point in time to back up the data. Therefore, the next backup may still be performed based on the original backup cycle and time. For example, assume that the scheduled backup cycle and time is set to 19:00-20:00 every Wednesday. If you modify the backup cycle and time to 19:00-20:00 every Thursday before the scheduled backup occurs, the system still backs up data at the original scheduled time of 19:00-20:00 of Wednesday.

Parameter	Description
Data Retention Period	The number of days for which data backup files are retained. Valid values: 7 to 730. Default value: 7.
Backup Cycle	The backup cycle. You can select one or more days within a week.
Backup Time	A period of time within a day. Unit: hours. We recommend that you back up data during off-peak hours.
Log Backup	Specifies whether to enable log backup. **Notice** If you disable log backup, all the log backup files are deleted, and you cannot restore data to a specific point in time.
Log Retention Period	The number of days for which log backup files are retained. Valid values: 7 to 730. Default value: 7.
OSS Dump Status	Specifies whether to enable Object Storage Service (OSS) dump. When OSS dump is enabled, new backup files are automatically dumped to a specific OSS bucket. For more information, see Create a bucket in *Object Storage Service User Guide*.
OSS Dumped Data	The type of backup files that are dumped to an OSS bucket. Valid values: ○ **Data Backup** ○ **Log Backup**
OSS Bucket	The OSS bucket to which backup files are dumped. The OSS bucket must belong to the same Apsara Stack tenant account as your ApsaraDB RDS instance. You must make sure that an OSS bucket is created. For more information, see Create a bucket in *Object Storage Service User Guide*.
Restore Individual Database/Table	Specifies whether to enable restoration for individual databases or tables. By default, this features is enabled and cannot be disabled. **Note** This feature is available only for ApsaraDB RDS instances that run MySQL 5.6 and 5.7 on High-availability Edition.

6. Click **OK**.

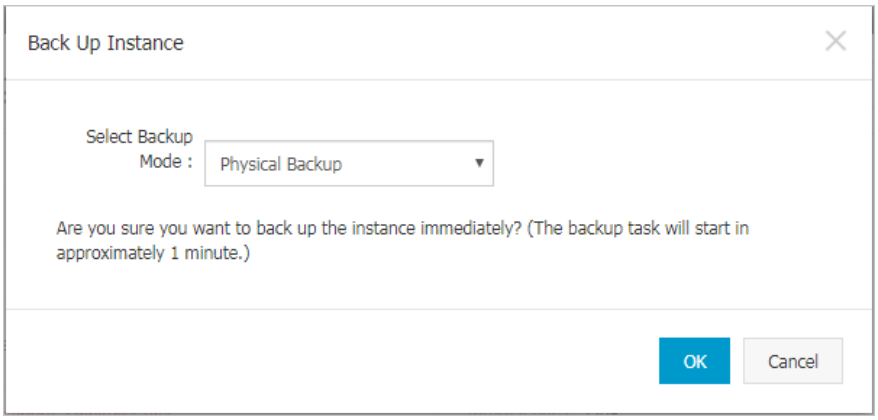
9.1.12.2. Manually back up an instance

Manual backup of ApsaraDB RDS supports both full physical and logical backups. This topic describes how to manually back up an ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. Click **Back Up Instance** in the upper-right corner.



4. In the dialog box that appears, set the backup mode and backup policy and then click **OK**.

> **Note** The following backup modes are available:
>
> - Physical backup: directly backs up all files in all databases.
> - Logical backup: extracts data from the databases by using SQL statements and backs up the data in the text format. If you select logical backup, you must select one of the following backup policies:
>   - Instance Backup: backs up the entire instance.
>   - Single-Database Backup: backs up one of the databases on the instance.

9.1.12.3. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB RDS console to archive the files and restore data to an on-premises database.

Limits

Database engine	Download of data backup files	Download of log backup files
MySQL 5.6 on RDS High-availability Edition	Supported	Supported
MySQL 5.7 on RDS High-availability Edition or Enterprise Edition	Supported	Supported
MySQL 8.0 on RDS High-availability Edition	Supported	Supported

Procedure

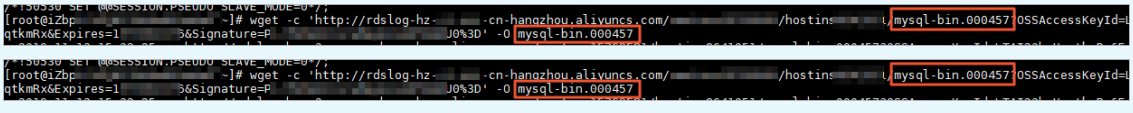
1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Backup and Restoration**.
4. Click the Data Backup or Log Backup tab.
   - To download data backup files, click the **Data Backup** tab.
   - To download log backup files, click the **Log Backup** tab.
5. Select a time range to which you want to restore the instance.
6. Find the data or log backup file that you want to download, and click **Download** in the **Actions** column.

> **Note**
> - If the Download button is unavailable, see the "Limits" section of this topic.
> - If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
> - If you want to use a log backup file to restore data to an on-premises database, take note of the following items:
>   - The instance No. of the log backup file must be the same as that of the data backup file.
>   - The start time of the log backup file must be later than the end time of the selected data backup file and earlier than the point in time to which you want to restore the data of your instance.

7. In the message that appears, click **Download**.

Download method	Description
Download	Use a browser to download the backup file.
Copy Internal URL	Copy the internal URL to download the file. If your Elastic Compute Service (ECS) and ApsaraDB RDS instances reside within the same region, you can log on to the ECS instance and use the internal URL to download the file. This method is fast and secure.
Copy Public URL	Copy the public URL to download the file. If you want to use other tools to download the file, use the public URL.

> **Note** If you use a Linux operating system, you can run the following command to download the file:
>
> ```
> wget -c '<The URL used to download the backup file>' -O <The name of the backup file>
> ```
>
> - The -c option enables resumable download.
> - The -O option saves the downloaded file by using the specified name. We recommend that you use the file name contained in the download URL.
> - If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').



9.1.12.4. Upload binlogs

Context

Context

This topic describes how to upload binlog files to Object Storage Service (OSS).

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
4. In the upper-right corner of the page, click **Upload Binlogs**.
5. In the message that appears, click **Confirm**.

9.1.12.5. Restore data to a new instance (formerly known as cloning an instance)

A cloned instance is a new instance that has the same content as the primary instance, including data and settings. This feature allows you to restore data of the primary instance or create multiple instances that are the same as the primary instance.

Prerequisites

Before you clone an instance, make sure that the following requirements are met:

- The primary instance is in the running state.
- The primary instance does not have ongoing migration tasks.
- Data backup and log backup are enabled.
- The primary instance has at least one completed backup set before you clone the instance by backup set.

Context

You can specify a backup set or a point in time within the backup retention period to clone an instance.

> Note
>
> - A cloned instance copies only the content of the primary instance, but not the content of read-only instances. The copied data includes database information, account information, and instance settings such as whitelist settings, backup settings, parameter settings, and alert threshold settings.
> - The database engine of a cloned instance must be the same as that of the primary instance. Other settings can be different, such as the instance edition, zone, network type, instance type, and storage capacity. If you want to restore the data of a primary instance, we recommend that you select a higher instance type and more storage capacity than those of the primary instance. This can speed up the data restoration process.
> - The account type of a cloned instance must be the same as that of the primary instance. The account password of the cloned instance can be changed.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Backup and Restoration**.
4. In the backup list, find a backup and click **Restore** in the Actions column.
5. In the dialog box that appears, select **Restore Database** and click **OK**.
6. On the **Restore Instance** page, configure the following parameters.

Section	Parameter	Description
Region	**Region**	The region in which the cloned instance resides.
Restore Database	**Restore Mode**	The data restore mode of the primary instance. Valid values: ○ **By Time** ○ **By Backup Set**
	Restore Time	The point in time to which you want to restore the primary instance. **Note** When **Restore Mode** is set to **By Time**, you must specify this parameter.
	Backup Set	The backup set for restoration. **Note** When **Restore Mode** is set to **By Backup Set**, you must specify this parameter.
Specifications	**Instance Name**	The name of the cloned instance.
	Database Engine	The database engine of the cloned instance, which cannot be modified.
	Engine Version	The engine version of the cloned instance, which cannot be modified.
	Edition	The RDS edition of the cloned instance. The actual values are displayed in the console.
	Storage Type	The storage type of the cloned instance. The actual values are displayed in the console.
	Instance Type	The instance type of the cloned instance. **Note** We recommend that you select a higher instance type and more storage capacity than those of the primary instance. This can speed up the data restoration process.
	Storage Capacity	The storage capacity of the cloned instance, which includes the space to store data, system files, binlog files, and transaction files. The available storage capacity is displayed in the console. **Note** AsparaDB RDS instances with local SSDs in the dedicated instance family occupy exclusive resources. The storage capacities are determined based on instance types.

Section	Parameter	Description
Network Type	Network Type	The network type of the cloned instance. ApsaraDB RDS instances support the following network types: ◦ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ◦ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways within a VPC. We recommend that you select VPC for improved security.
	VPC	The VPC in which the cloned instance resides. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	The vSwitch in the VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

7. Click **Submit**.

9.1.13. CloudDBA

9.1.13.1. Introduction to CloudDBA

CloudDBA is a cloud service for database self-detection, self-repair, self-optimization, self-maintenance, and self-security based on machine learning and expertise. CloudDBA helps you ensure stable, secure, and efficient databases without worrying about the management complexity and service failures caused by manual operations.

Features

In ApsaraDB RDS for MySQL, CloudDBA provides the following features:

- Diagnostics

  You can diagnose your instance and view the visualized diagnostic results.

- Autonomy center

  You can configure automatic detection for exceptions on core metrics. When an exception is detected, the system performs diagnostics on sessions, SQL statements, and the database capacity, provides optimization suggestions, and then performs automatic optimization if the related permissions have been granted.

- Instance sessions

  You can view sessions, check session statistics, analyze SQL statements, and optimize the execution of SQL statements.

- Real-time monitoring

  You can view the real-time information of your instance, such as the queries per second (QPS), transactions per second (TPS), number of connections, and network traffic.

- Storage analysis

You can view the storage overview, trends, exceptions, tablespaces, and data spaces.

- Deadlock analysis

  You can view and analyze the last deadlock in a database.

- Dashboard

  You can view and compare performance trends, customize monitoring dashboards, check exceptions, and view instance topologies.

- Slow query logs

  You can view the trends and statistics of slow queries.

- Diagnostic reports

  You can generate diagnostic reports or view automatically generated reports about instance health, alerts, and slow queries.

9.1.13.2. Diagnostics

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostics feature. This feature diagnoses your ApsaraDB RDS for MySQL instance and visualizes the results.

Navigate to the Diagnostics tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Diagnostics** tab.

> **Note** For more information, see Diagnostics in *Database Autonomy Service User Guide*.

9.1.13.3. Autonomy center

In ApsaraDB RDS for MySQL, CloudDBA provides the autonomy center feature. When an exception on core metrics is detected by CloudDBA, the system performs diagnostics on sessions, SQL statements, and the database capacity to identify the causes. CloudDBA also provides optimization and mitigation suggestions. If the related permissions have been granted, CloudDBA automatically performs the optimization and mitigation operations.

Navigate to the Autonomy Center tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Autonomy Center** tab.

> **Note** For more information, see Diagnostics in *Database Autonomy Service User Guide*.

9.1.13.4. Session management

In ApsaraDB RDS for MySQL, CloudDBA provides the session management feature. This feature allows you to view and manage the sessions of an instance.

Navigate to the Session Management page

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Session Management** tab.

> **Note** For more information, see Instance sessions in *Database Autonomy Service User Guide*.

9.1.13.5. Real-time monitoring

In ApsaraDB RDS for MySQL, CloudDBA provides the real-time monitoring feature. This feature allows you to view the real-time performance of your ApsaraDB RDS for MySQL instance.

Navigate to the Real-time Monitoring tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Real-time Monitoring** tab.

> **Note** For more information, see Real-time monitoring in *Database Autonomy Service User Guide*.

9.1.13.6. Storage analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the storage analysis feature. This feature allows you to check and solve storage exceptions in a timely manner to ensure database stability.

Context

You can use the storage analysis feature of CloudDBA to view the disk space usage of your ApsaraDB RDS for MySQL instance and the number of remaining days when disk space is available. It also provides information about the space usage, fragmentation, and exception diagnostic results of a table.

Navigate to the Storage Analysis tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Storage Analysis** tab.

> **Note** For more information, see Storage analysis in *Database Autonomy Service User Guide*.

9.1.13.7. Deadlock analysis

In ApsaraDB RDS for MySQL, CloudDBA provides the deadlock analysis feature. This feature allows you to view and analyze the last deadlock in a database.

Navigate to the Deadlock Analysis page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Deadlock Analysis** tab.

> **Note** For more information, see Deadlock analysis in *Database Autonomy Service User Guide*.

9.1.13.8. Dashboard

In ApsaraDB RDS for MySQL, CloudDBA provides the dashboard feature. This feature allows you to view performance trends in specific ranges, compare performance trends, and customize charts to view performance trends.

Navigate to the Dashboard page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Dashboard**.

> **Note** For more information, see Dashboard in *Database Autonomy Service User Guide*.

9.1.13.9. Slow query logs

In ApsaraDB RDS for MySQL, CloudDBA provides the slow query logs feature. This feature allows you to view the trends and execution details of slow queries and obtain optimization suggestions for your ApsaraDB RDS for MySQL instance.

Navigate to the Slow Query Logs page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Slow Query Logs**.

> **Note** For more information, see Slow query logs in *Database Autonomy Service User Guide*.

9.1.13.10. Diagnostic reports

In ApsaraDB RDS for MySQL, CloudDBA provides the diagnostic reports feature. This feature allows you to create and view diagnostic reports.

Navigate to the Diagnostic Reports page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostic Reports**.

> **Note** For more information, see Diagnostic reports in *Database Autonomy Service User Guide*.

9.1.14. Manage logs

All ApsaraDB RDS instances support log management. You can query the details of error and slow query logs of an ApsaraDB RDS instance by using the ApsaraDB RDS console. The logs help you perform troubleshooting.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. In the left-side navigation pane, click **Logs**.
4. On the **Logs** page, click the **Error Logs**, **Slow Query Logs**, **Slow Query Log Summary**, or **Primary/Secondary Switching Logs** tab, select a time range, and then click **Search**.

Log type	Description
Error Logs	Records database running errors that occurred within the latest month.
Slow Query Logs	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed. **Note** Slow query logs in the ApsaraDB RDS console are updated once every minute. However, you can query real-time slow query logs from the mysql.slow_log table.
Slow Query Log Summary	Records and analyzes SQL statements within the last month that took longer than one second to execute. Analysis reports of slow query logs are provided.
Primary/Secondary Switching Logs	Records the primary/secondary instance switching logs. This feature is available for ApsaraDB RDS instances that run MySQL on RDS High-availability Edition.

9.1.15. Use mysqldump to migrate MySQL data

This topic describes how to use mysqldump to migrate data from an on-premises database to an ApsaraDB RDS for MySQL instance.

Prerequisites

An ECS instance is created.

Context

mysqldump is easy to use but requires extensive downtime. This tool is suitable for scenarios where the amount of data is small or extensive downtime is allowed.

ApsaraDB RDS for MySQL is fully compatible with the native database service. The procedure of migrating data from the original database to an ApsaraDB RDS for MySQL instance is similar to that of migrating data from one MySQL server to another.

Before you migrate data, you must create an account that is used to migrate data from the on-premises MySQL database. You must grant the read and write permissions on the on-premises MySQL databases to the account.

Procedure

1. Run the following command to create a migration account for the on-premises database:

   ```
   CREATE USER 'username'@'host' IDENTIFIED BY 'password';
   ```

   Parameter description:

   - username: the name of the account to be created.
   - host: the host from which the account is authorized to log on to the on-premises MySQL database. If you want to allow access from a local host, set this parameter to localhost. If you want to allow access from all hosts, set this parameter to a percent sign (%).
   - password: the password of the account.

   For example, you can run the following command to create an account with the username William and the password Changme123. The account is authorized to log on to the on-premises MySQL database from all hosts.

```
CREATE USER 'William'@'%' IDENTIFIED BY 'Changme123';
```

2. Run the following command to grant permissions to the migration account in the on-premises database:

```
GRANT SELECT ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION; GRANT REPLICATION SLAVE ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION;  GRANT REPLICATION SLAVE ON databasename.tablename TO 'username'@'host' WITH GRANT OPTION;
```

Parameter description:

- privileges: the operation permissions granted to the account, such as SELECT, INSERT, and UPDATE. To authorize the account to perform all operations, set this parameter to ALL.
- databasename: the name of the on-premises MySQL database. If you want to grant all database permissions to the account, set this parameter to an asterisk (*).
- tablename: the name of the table whose data you want to migrate. If you want to grant all table permissions to the account, set this parameter to an asterisk (*).
- username: the name of the account.
- host: the host from which the account is authorized to log on to the on-premises MySQL database. If you want to allow access from a local host, set this parameter to localhost. If you want to allow access from all hosts, set this parameter to a percent sign (%).
- WITH GRANT OPTION: authorizes the account to use the GRANT statement. This parameter is optional.

For example, you can execute the following statement to grant all permissions on tables and databases to the William account. The account is authorized to log on to the database from all hosts.

```
GRANT ALL ON *. * TO 'William'@'%';
```

3. Use the data export tool of mysqldump to export data from the database as a data file.

> **Notice** Do not update data during data export. In this step, only data is exported. Stored procedures, triggers, and functions are not exported.

```
mysqldump -h localIp -u userName -p --opt --default-character-set=utf8 --hex-blob dbName --skip-triggers > /tmp/dbName.sql
```

Parameter description:

- localIp: the IP address of the host where the on-premises MySQL database resides.
- userName: the account that is used to migrate data from the on-premises MySQL database.
- dbName: the name of the on-premises MySQL database.
- /tmp/dbName.sql: the name of the exported data file.

4. Use mysqldump to export stored procedures, triggers, and functions.

> **Notice** Skip this step if no stored procedures, triggers, or functions are used in the database. When stored procedures, triggers, and functions are exported, you must remove the DEFINER to ensure compatibility with ApsaraDB RDS for MySQL.

```
mysqldump -h localIp -u userName -p --opt --default-character-set=utf8 --hex-blob dbName -R | sed -e 's/DEFINER[ ]*=[ ]*[^*]*\*/\*/' > /tmp/triggerProcedure.sql
```

Parameter description:

- localIp: the IP address of the host where the on-premises MySQL database resides.
- userName: the account that is used to migrate data from the on-premises MySQL database.
- dbName: the name of the on-premises MySQL database.
- /tmp/triggerProcedure.sql: the name of the exported stored procedure file.

5. Upload the data file and stored procedure file to the ECS instance.

In this example, the files are uploaded to the following paths:

```
/tmp/dbName.sql
```

```
/tmp/triggerProcedure.sql
```

6. Log on to the ECS console and import both the data file and the stored procedure file to the destination ApsaraDB RDS for MySQL instance.

   > **Note** For information about how to log on to the ECS instance, see topics in the **Connect to an instance** section of ECS User Guide.

   ```
   mysql -h intranet4example.mysql.rds.aliyuncs.com -u userName -p dbName < /tmp/dbName.sql
   ```

   ```
   mysql -h intranet4example.mysql.rds.aliyuncs.com -u userName -p dbName < /tmp/triggerProcedure.sql
   ```

   Parameter description:

   - intranet4example.mysql.rds.aliyuncs.com: the endpoint of the ApsaraDB RDS for MySQL instance. An internal endpoint is used in this example.
   - userName: the migration account of the ApsaraDB RDS for MySQL database.
   - dbName: the name of the on-premises MySQL database from which you want to import data.
   - /tmp/dbName.sql: the name of the data file that you want to import.
   - /tmp/triggerProcedure.sql: the name of the stored procedure file that you want to import.

10.ApsaraDB RDS for SQL Server

10.1. User Guide(RDS SQL Server)

10.1.1. What is ApsaraDB RDS?

ApsaraDB RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS provides a set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four database engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these engines to meet your business requirements. This topic describes the SQL Server engine.

ApsaraDB RDS for SQL Server

ApsaraDB RDS for SQL Server provides strong support for a variety of enterprise applications under the high-availability architecture. ApsaraDB RDS for SQL Server can also restore data to a specific point in time, which reduces costs.

ApsaraDB RDS for SQL Server provides basic features such as whitelist configuration, backup and restoration, transparent data encryption, data migration, and management for instances, accounts, and databases.

10.1.2. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.

b. Enter the account and password again as in Step 2 and click **Log On**.

c. Enter a six-digit MFA verification code and click **Authenticate**.

- You have enabled MFA and bound an MFA device.

  Enter a six-digit MFA authentication code and click **Authenticate**.

> **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.

5. In the top navigation bar, choose **Products > Database Services > ApsaraDB RDS**.

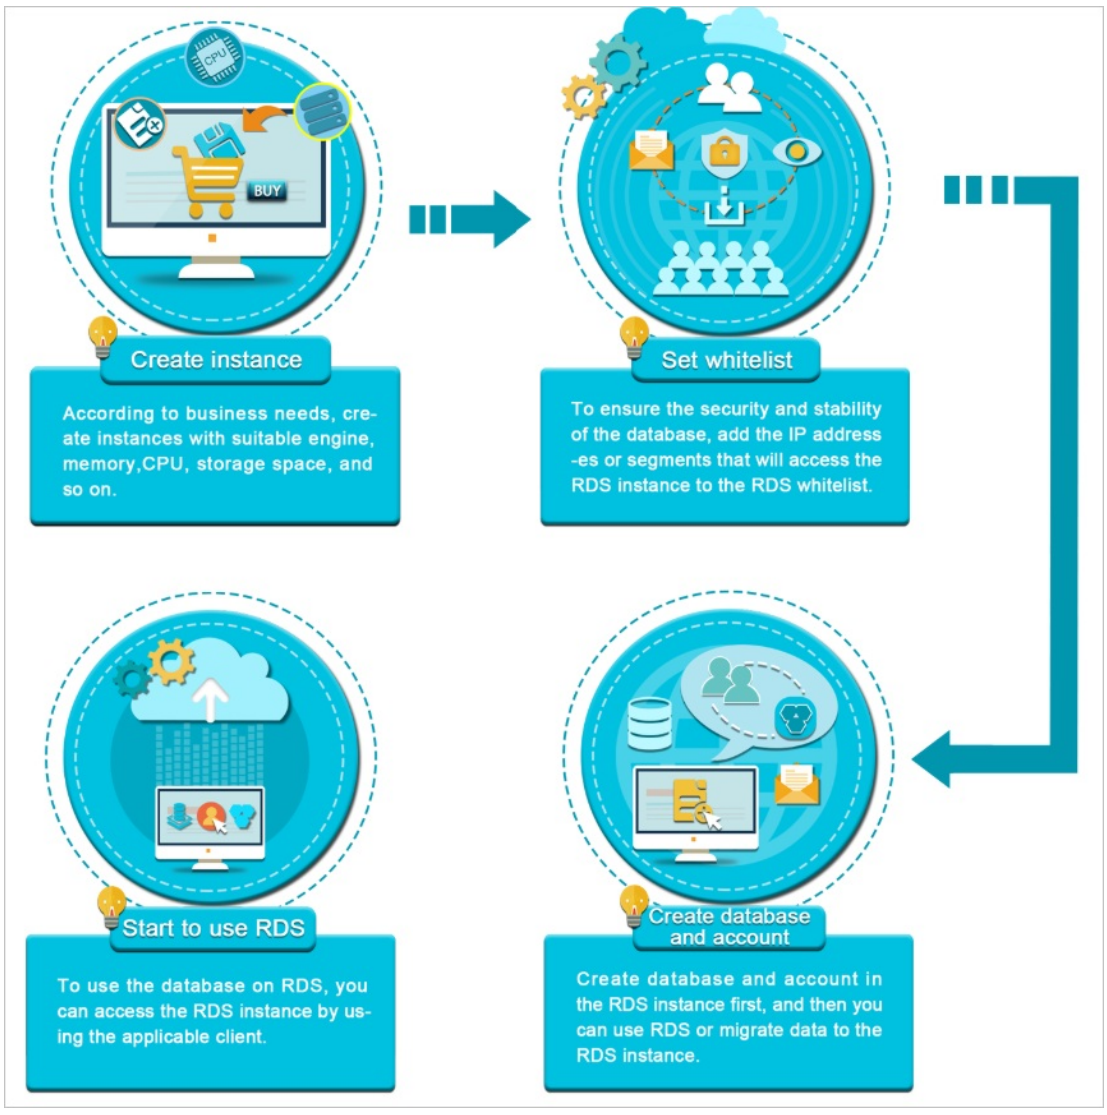
10.1.3. Quick Start

10.1.3.1. Procedure

ApsaraDB RDS quick start covers the following topics: creating an ApsaraDB RDS instance, configuring an IP address whitelist, creating a database, creating an account, and connecting to the instance.

The following figure shows the operations that you must perform before you use an ApsaraDB RDS instance.

Quick start flowchart



10.1.3.2. Create an instance

This topic describes how to create an instance in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.

Section	Parameter	Description
Specifications	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **SQLServer**.
	Engine Version	The version of the database engine. Valid values: ○ **2012_ent_ha**: SQL Server 2012 EE ○ **2012_std_ha**: SQL Server 2012 SE ○ **2016_ent_ha**: SQL Server 2016 EE ○ **2016_std_ha**: SQL Server 2016 SE ○ **2017_ent_ha**: SQL Server 2017 EE
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. The storage type is automatically set to **Standard SSD**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	The VPC in which you want to create the instance. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.

Section	Parameter	Description
	vSwitch	The vSwitch in the VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

10.1.3.3. Configure an IP address whitelist for an ApsaraDB RDS instance

After you create an ApsaraDB RDS instance, you must add the IP addresses or CIDR blocks that are used for database access to the IP address whitelist of the instance to ensure database security and reliability.

Context

IP address whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you maintain your IP address whitelists on a regular basis.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   Note If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance and click **OK**.

> **Note**
>
> - Limits for IP address whitelists:
>   - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.
>
>   Supported formats are `0.0.0.0/0`, IP addresses such as `10.23.12.24`, or CIDR blocks such as `10.23.12.24/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits.
>   - If an IP address whitelist is empty or contains only `0.0.0.0/0`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
> - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the Elastic Compute Service (ECS) instances that are created within your Apsara Stack tenant account appear. Then, you can select the IP addresses and add them to an IP address whitelist.

10.1.3.4. Connect to an instance

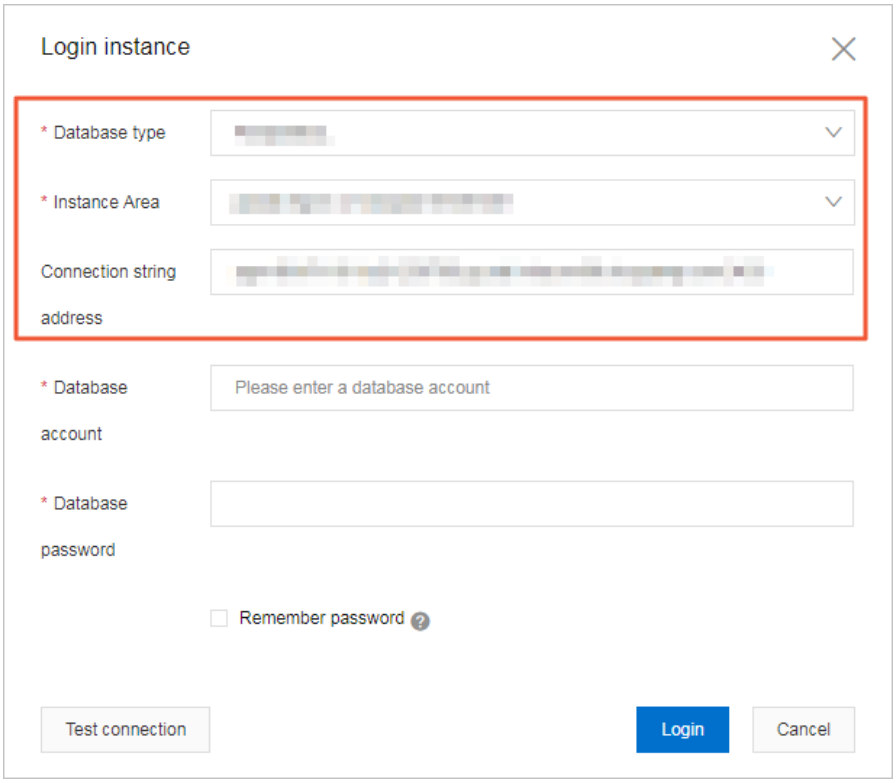
This topic describes how to use Data Management (DMS) to connect to an ApsaraDB RDS instance.

Prerequisites

- A database is created. For more information, see Create a database.
- A database account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

10.1.3.5. Create an account

This topic describes how to create an account on an ApsaraDB RDS for SQL Server instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account that you want to create.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter and end with a lowercase letter or a digit.
Account Type	○ **Privileged Account**: You can select the **Privileged Account** option only if you create an account on your ApsaraDB RDS instance for the first time. Each ApsaraDB RDS instance can have only a single privileged account. The privileged account of an ApsaraDB RDS instance cannot be deleted. ○ **Standard Account**: You can select the **Standard Account** option only after a privileged account is created on your ApsaraDB RDS instance. Each ApsaraDB RDS instance can have more than one standard account. You must manually grant the permissions on databases to each standard account.
Authorized Databases (available only for standard accounts)	Select the authorized databases of the account when the **Standard Account** type is selected. If no databases are created, you can leave this parameter empty. You can perform the following steps to grant permissions on more than one database to the account: i. In the **Unauthorized Databases** section, select the databases on which you want to grant permissions to the account. ii. Click **Add** to add the selected databases to the **Authorized Databases** section. iii. In the Authorized Databases section, specify the permissions that the account is granted on each authorized database. The permissions can be **Read/Write**, **Read-only**, or **Owner**. You can also click **Set All to Read/Write**, **Set All to Read-only**, or **Set All to Owner** to set the permissions of the account on all authorized databases. **Note** ■ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the **Owner** permission on the database. ■ The account has permissions on all databases and does not require authorization if you select the **Privileged Account** type.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include `! @ # $ % ^ & * ( ) _ + - =`
Re-enter Password	Enter the password of the account again.

Parameter	Description
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

10.1.3.6. Create a database

This topic describes how to create a database on an ApsaraDB RDS for SQL Server instance in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. In the upper-right corner of the page, click **Create Database**.
6. Configure the parameters for the database that you want to create.

Parameter	Description
Database Name	Enter the name of the database. The name must be 2 to 64 characters in length. It can contain lowercase letters, digits, underscores (_), and hyphens (-). It must start with a lowercase letter and end with a lowercase letter or digit.
Supported Character Sets	Select the character set that is supported by the database. You can also select **all** and then select a character set from the drop-down list that appears.
Description	Enter a description of the database to facilitate subsequent management. The description can be up to 256 characters in length.

7. Click **Create**.

10.1.4. Instances

10.1.4.1. Create an instance

This topic describes how to create an instance in the ApsaraDB RDS console.

Prerequisites

An Apsara Stack tenant account is created.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **SQLServer**.

Section	Parameter	Description
	Engine Version	The version of the database engine. Valid values: ○ **2012_ent_ha**: SQL Server 2012 EE ○ **2012_std_ha**: SQL Server 2012 SE ○ **2016_ent_ha**: SQL Server 2016 EE ○ **2016_std_ha**: SQL Server 2016 SE ○ **2017_ent_ha**: SQL Server 2017 EE
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. The storage type is automatically set to **Standard SSD**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security.
	VPC	The VPC in which you want to create the instance. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	vSwitch	The vSwitch in the VPC. **Note** When **Network Type** is set to **VPC**, you must specify this parameter.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

10.1.4.2. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as its basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of an instance to go to the **Basic Information** page.
   - On the **Instances** page, click **Manage** in the **Actions** column corresponding to an instance to go to the **Basic Information** page.

10.1.4.3. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS instance. This applies if the number of connections exceeds the specified threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click **Restart Instance** in the upper-right corner.

   > **Note** When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

4. In the Restart Instance message, click **Confirm**.

10.1.4.4. Change the specifications of an instance

This topic describes how to change specifications such as the instance type and storage space if they do not meet the requirements of your application. When the specification changes take effect, a 30-second network interruption may occur. Business operations that involve databases, accounts, and networks are interrupted. We recommend that you change the specifications during off-peak hours or make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Change Specifications**.
5. On the **Change Specifications** page, specify **Instance Type** and **Storage Capacity**.
6. After you configure the preceding parameters, click **Submit**.

10.1.4.5. Set a maintenance window

This topic describes how to set the maintenance window of an ApsaraDB RDS for SQL Server instance. The backend system performs maintenance on the ApsaraDB RDS instance during the maintenance window. This ensures the stability of the ApsaraDB RDS instance. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Context

- An instance enters the **Maintaining Instance** state before the maintenance window to ensure stability during the maintenance process. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, except for account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, one or two network interruptions may occur. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

> **Note** The maintenance window is displayed in UTC+8.

10.1.4.6. Configure primary/secondary switchover

ApsaraDB RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance.

Prerequisites

The instance is in the **Running** state.

Context

An ApsaraDB RDS for SQL Server instance has a secondary instance. Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup and does not allow external access. If the primary instance cannot be accessed, your workloads are automatically switched over to the secondary instance. After the switchover, the primary instance becomes the secondary instance.

> **Notice**
> - You may encounter a network interruption during a switchover. Make sure that your application is configured to automatically reconnect to the instance.
> - During a switchover, a 1-minute data quality protection mechanism is enabled for data synchronization. If the primary and secondary database states are incorrect or if the latency for data synchronization exceeds 1 minute due to SQL Server errors, the HA system does not automatically perform the primary/secondary switchover. You must determine whether to perform the switchover.
> - If an instance is intermittently unavailable due to excessive mirroring event waits, the switchover is not performed. The instance automatically becomes available again.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the dialog box that appears, click **OK**.

Result

After the switchover is complete, the original primary instance becomes the secondary instance for the next primary/secondary switchover.

10.1.4.7. Release an instance

This topic describes how to manually release an instance.

Context

- Only instances in the running state can be manually released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. Find the instance that you want to release and choose **More > Release Instance**.
3. In the **Release Instance** message, click **Confirm**.

10.1.4.8. Read-only instances

10.1.4.8.1. Overview of read-only ApsaraDB RDS for SQL Server instances

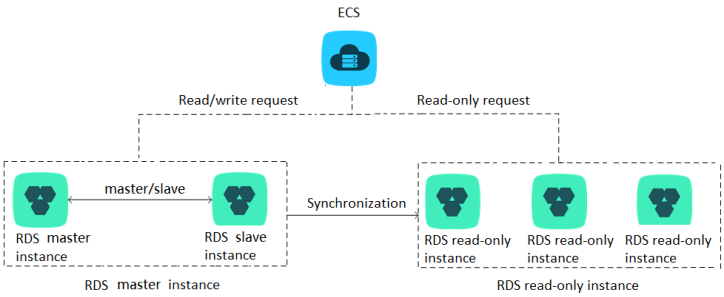
This topic provides an overview of read-only ApsaraDB RDS for SQL Server instances. If a large number of read requests overwhelm the primary instance, your business may be interrupted. In this case, you can create one or more read-only instances to offload read requests from the primary instance. This scales the read capability of your database system and increases the throughput of your application.

Overview

When a read-only instance is created, the data is replicated from the secondary instance. The data is consistent with that of the primary instance. Data updates of the primary instance are synchronized to all read-only instances.

> **Note**
> - Only ApsaraDB RDS instances that run SQL Server 2017 EE support read-only instances.
> - Each read-only instance works in a single-node architecture, where no instances are provided as backups.

The following figure shows the topology of read-only instances.



Features

- The specifications of a read-only instance can differ from the specifications of the primary instance, and can be changed at any time. We recommend that you select specifications of a read-only instance that are higher than or equal to those of the primary instance. If the specifications of a read-only instance are lower than those of the primary instance, the read-only instance may have high latency or workloads.
- Read-only instances do not require database or account maintenance, because their database and account information is synchronized with the primary instance.
- A read-only instance automatically replicates the IP address whitelists of the primary instance. However, the IP address whitelists for the read-only instance are independent of those of the primary instance. For information about how to modify the whitelists of a read-only instance, see Configure a whitelist.
- You can monitor up to 20 system performance metrics, such as the disk capacity, input/output operations per second (IOPS), number of connections, CPU utilization, and network traffic.

Limits

- You can create up to seven read-only instances.
- You cannot configure backup policies or manually create backups for read-only instances, because these are already configured or created on the primary instance.
- You cannot create a temporary instance by using a backup set or from a point in time. In addition, you cannot overwrite a read-only instance by using a backup set.
- After a read-only instance is created, you cannot use a data backup file to restore it in overwrite mode.
- You cannot migrate data to read-only RDS instances.
- You cannot create or delete databases on read-only instances.
- You cannot create or delete accounts, authorize accounts, or change the passwords of accounts on read-only instances.

FAQ

Can I manage the accounts created on the primary instance from its read-only instances?

No, although accounts created on the primary instance are replicated to its read-only instances, you cannot manage the accounts on the read-only instances. The accounts have only read permissions on the read-only instances.

10.1.4.8.2. Create a read-only ApsaraDB RDS for SQL Server instance

This topic describes how to create a read-only instance for your primary ApsaraDB RDS for SQL server instance. This allows your database system to process a large number of read requests and increases the throughput of your application. Each read-only ApsaraDB RDS instance is a replica of the primary instance. Data updates on the primary instance are synchronized to all the read-only instances.

Prerequisites

The primary instance runs SQL Server 2017 EE.

Precautions

- You can create read-only instances for the primary ApsaraDB RDS instance. However, you cannot convert existing ApsaraDB RDS instances into read-only instances.
- While you create a read-only instance, the system replicates data from a secondary instance. Therefore, the operation of your primary instance is not interrupted.
- You can create up to seven read-only instances.
- For more information about read-only ApsaraDB RDS instances, see Overview of read-only ApsaraDB RDS for SQL Server instances.

Create a read-only instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Distributed by Instance Role** section on the right side of the page, click **Create Read-only Instance**.
5. Configure the following parameters and click **Submit**.

Section	Parameter	Description
Region	**Region**	The region in which you want to create the instance.
Specifications	**Database Engine**	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Edition	Set the value to **Read-only**.
	Instance Type	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade. For more information, see Instance types in *ApsaraDB RDS Product Information*. **Note** To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type as the primary instance for read-only instances.
	Storage Capacity	The storage space of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type and storage space as the primary instance for the read-only instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.

Section	Parameter	Description
Network Type	Network Type	The network type of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	VPC	Select a VPC if the network type is set to VPC.
	vSwitch	Select a vSwitch if the network type is set to VPC.

10.1.4.8.3. View details of read-only instances

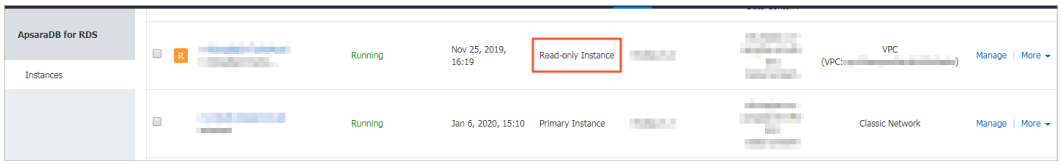
This topic describes how to view details of read-only instances. You can go to the Basic Information page of a read-only instance from the Instances page or the read-only instance list of the primary instance. Read-only instances are managed in the same way as primary instances. The read-only instance management page shows the management operations that can be performed.

View instance details by using a read-only instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click the ID of a read-only instance. The **Basic Information** page appears.

   In the instance list, Instance Role of read-only instances is displayed as Read-only Instance, as shown in View a read-only instance.

   View a read-only instance



View instance details by using the primary instance

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the read-only instance management page.

10.1.5. Accounts

10.1.5.1. Create an account

This topic describes how to create an account on an ApsaraDB RDS for SQL Server instance.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the right side of the page, click **Create Account**.
6. Enter the information of the account that you want to create.

Parameter	Description
Database Account	Enter the name of the account. The name must be 2 to 16 characters in length and can contain lowercase letters, digits, and underscores (_). It must start with a lowercase letter and end with a lowercase letter or a digit.
Account Type	○ **Privileged Account**: You can select the **Privileged Account** option only if you create an account on your ApsaraDB RDS instance for the first time. Each ApsaraDB RDS instance can have only a single privileged account. The privileged account of an ApsaraDB RDS instance cannot be deleted. ○ **Standard Account**: You can select the **Standard Account** option only after a privileged account is created on your ApsaraDB RDS instance. Each ApsaraDB RDS instance can have more than one standard account. You must manually grant the permissions on databases to each standard account.
Authorized Databases (available only for standard accounts)	Select the authorized databases of the account when the **Standard Account** type is selected. If no databases are created, you can leave this parameter empty. You can perform the following steps to grant permissions on more than one database to the account: i. In the **Unauthorized Databases** section, select the databases on which you want to grant permissions to the account. ii. Click **Add** to add the selected databases to the **Authorized Databases** section. iii. In the Authorized Databases section, specify the permissions that the account is granted on each authorized database. The permissions can be **Read/Write**, **Read-only**, or **Owner**. You can also click **Set All to Read/Write**, **Set All to Read-only**, or **Set All to Owner** to set the permissions of the account on all authorized databases. **Note** ■ The account is authorized to create tables, delete tables, and modify schemas in a database only when it has the **Owner** permission on the database. ■ The account has permissions on all databases and does not require authorization if you select the **Privileged Account** type.
Password	Enter the password of the account. The password must meet the following requirements: ○ The password is 8 to 32 characters in length. ○ The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include `! @ # $ % ^ & * ( ) _ + - =`
Re-enter Password	Enter the password of the account again.
Description	Enter a description that helps identify the account. The description can be up to 256 characters in length.

7. Click **Create**.

10.1.5.2. Reset the password

You can use the ApsaraDB RDS console to reset the password of your database account.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts**.
4. Find an account and click **Reset Password** in the **Actions** column.
5. In the dialog box that appears, enter and confirm the new password, and then click **OK**.

> **Note** The password must meet the following requirements:
>
> - The password is 8 to 32 characters in length.
> - The password contains at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include
>
>   ! @ # $ % ^ & * ( ) _ + - =

10.1.6. Databases

10.1.6.1. Create a database

This topic describes how to create a database on an ApsaraDB RDS for SQL Server instance.

Terms

- Instance: a virtualized database server on which you can create and manage more than one database.
- Database: a set of data that is stored in an organized manner and can be shared by a number of users. A database provides the minimal redundancy and is independent of applications. In simple words, a database is a data warehouse that is used to store data.
- Character set: a collection of letters, special characters, and encoding rules that are used in a database.

Prerequisites

An ApsaraDB RDS for SQL Server instance is created. For more information, see Create an instance.

Procedure

For more information, see Create a database.

10.1.6.2. Delete a database

This topic describes how to delete a database from an ApsaraDB RDS for SQL Server instance. You can delete a database by using the ApsaraDB RDS console or an SQL statement.

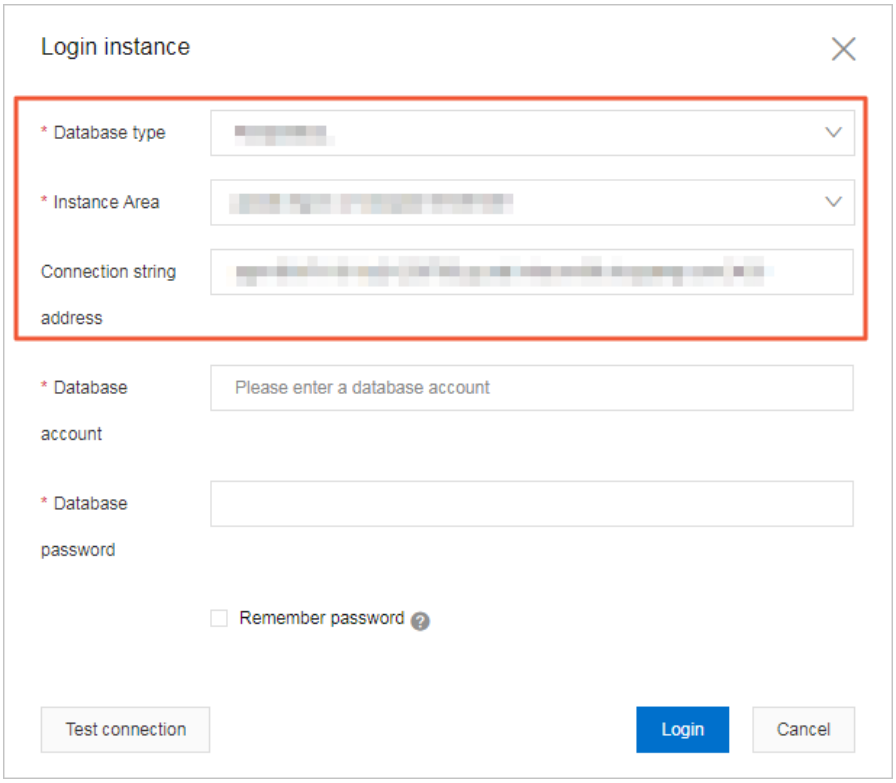
Use the console to delete a database

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Databases**.
5. Find the database that you want to delete and click **Delete** in the **Actions** column.
6. In the message that appears, click **Confirm**.

Execute an SQL statement to delete a database

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.

Parameter	Description
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to delete a database:

```
drop database <database name>;
```

> **Note** If the instance runs SQL Server 2012 or later on RDS High-availability Edition, you can also use the following stored procedure. This stored procedure deletes the specified database, removes the associated image, and closes the connection to the database.
>
> ```
> EXEC sp_rds_drop_database 'database name'
> ```

8. Click **execute**.

10.1.6.3. Change the character set collation and the time zone of system databases

This topic describes how to change the character set collation and the time zone of system databases. System databases include master, msdb, tempdb, and model.

Prerequisites

- The instance runs SQL Server 2012, 2016, or 2017.
- No database other than system databases exists on the instance.

> **Note** If you have just deleted databases from the instance, the deletion task may be pending in the secondary instance. Before you change the character set collation and the time zone, make sure that the primary and secondary instances do not contain databases.

Precautions

- The default character set collation is Chinese_PRC_CI_AS.
- The default time zone is China Standard Time.
- You can view the available character set collations and time zones in the console.
- The instance is in the unavailable state during the change process. It takes about 1 minute to change the time zone, and 2 to 10 minutes to change the character set collation.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic**

Information page.

4. In the left-side navigation pane, click **Databases**.
5. On the Databases page, click **Change Character Set Collation and Time Zone**.

> **Note** If you fail to find this button on the page, make sure that the requirements in Prerequisites are met.

6. In the dialog box that appears, select **Time Zone**, **Character Set Collation**, or both of them, and click **OK**.

UTC offsets of time zones

Time zone	UTC offset	Description
Afghanistan Standard Time	(UTC+04:30)	Kabul
Alaskan Standard Time	(UTC-09:00)	Alaska

10.1.7. Database connection

10.1.7.1. Change a vSwitch

This topic describes how to change a vSwitch for an ApsaraDB RDS instance that is deployed in a VPC.

Prerequisites

The instance is deployed in a VPC.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. In the upper-right corner of the Database Connection section, click **Switch vSwitch**.
5. In the dialog box that appears, select a vSwitch and click **OK**.
6. In the message that appears, click **Switch**.

> **Note**
>
> - You may encounter a network interruption of about 30 seconds during the change process. Make sure that your application is configured to automatically reconnect to the instance.
> - We recommend that you clear the cache immediately after the instance is switched to a new VPC and vSwitch. Otherwise, data can only be read but cannot be written.

10.1.7.2. Change the endpoint and port number of an instance

This topic describes how to view and change the endpoint and port number of an ApsaraDB RDS instance.

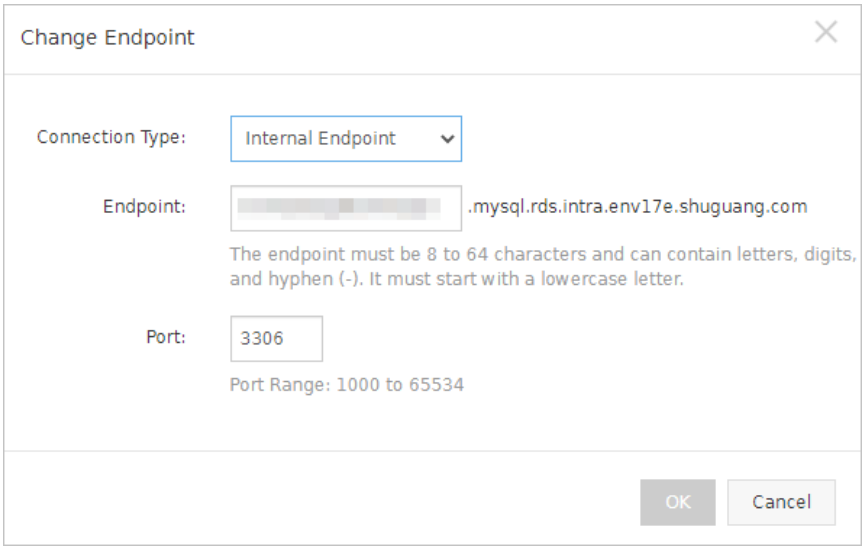
View the endpoint and port number

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the **Basic Information** section, view the internal and public endpoints and port numbers.

Change the endpoint and port number

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. In the upper-right corner of the Database Connection section, click **Change Endpoint**.
5. In the dialog box that appears, set Connection Type, Endpoint, and Port, and then click **OK**.



> **Note**
> - The prefix of an endpoint must be 8 to 64 characters in length and can contain letters, digits, and hyphens (-). It must start with a lowercase letter.
> - The port number must be a value within the range of 1000 to 65534.

10.1.7.3. Apply for and release an internal endpoint or a public endpoint for an instance

ApsaraDB RDS supports two types of endpoints: internal endpoints and public endpoints. The default type of the endpoint used to connect to an ApsaraDB RDS instance is determined by the network connection type selected when you create the instance. This topic describes how to apply for and release an internal endpoint or a public endpoint for an ApsaraDB RDS instance.

Apply for an internal endpoint or a public endpoint

If you set **Connection Type** to **Internet** when you create an ApsaraDB RDS instance, the database system assigns a public endpoint to the instance, and you can apply for an internal endpoint. Otherwise, the database system assigns an internal endpoint to the instance, and you can apply for a public endpoint.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. Apply for an internal endpoint or a public endpoint:
   - To apply for a public endpoint, click **Apply for Public Endpoint**.
   - To apply for an internal endpoint, click **Apply for Internal Endpoint**.
5. In the message that appears, click **OK**.

Release an internal endpoint or a public endpoint

If an endpoint is no longer needed, you can release the endpoint to ensure instance security.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Database Connection**.
4. Release an internal endpoint or a public endpoint:
   - To release a public endpoint, click **Release Public Endpoint**.
   - To release an internal endpoint, click **Release Internal Endpoint**.
5. In the message that appears, click **OK**.

FAQ

- Q: Can I change the endpoints and port numbers of my ApsaraDB RDS instance?

  A: No, you cannot change the endpoints of your ApsaraDB RDS instance. You can change the prefixes of the endpoints. You can also change the port numbers of your instance. For more information, see Change the endpoint and port number of an instance.

- Q: Can I configure the endpoints of my ApsaraDB RDS instances to static IP addresses?

  A: No, you cannot configure the endpoints of your ApsaraDB RDS instance to static IP addresses. Both primary/secondary switchovers and specification changes may cause changes to the IP addresses. Therefore, we recommend that you connect to your instance by using an endpoint. This allows you to minimize the impact on your workloads and eliminates the need to modify the configuration data on your application.

10.1.7.4. Connect to an instance

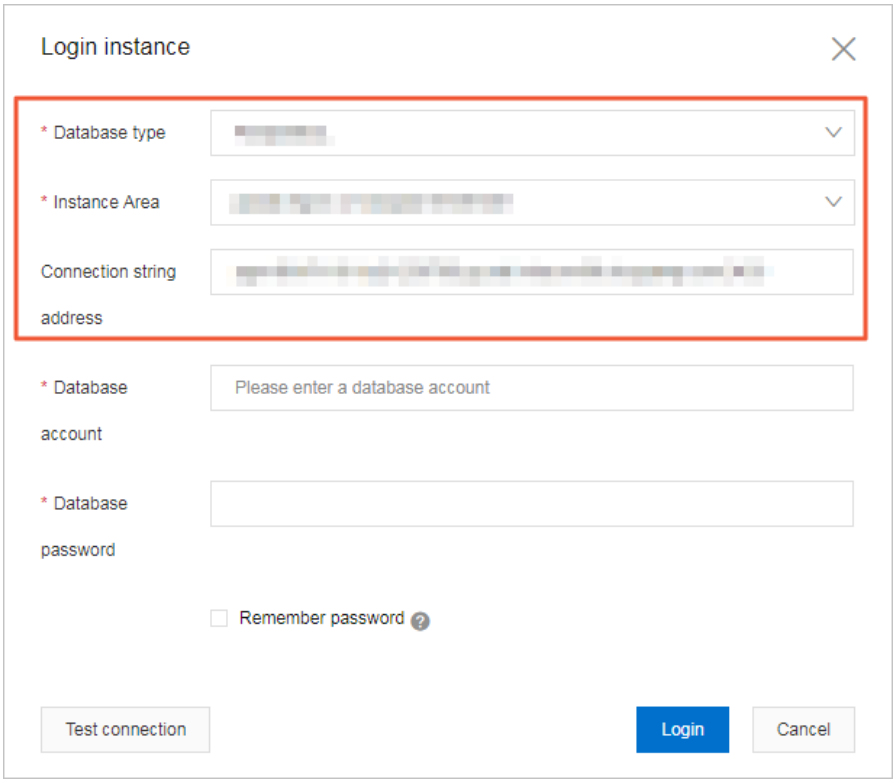
This topic describes how to use Data Management (DMS) to connect to an ApsaraDB RDS instance.

Prerequisites

- A database is created. For more information, see Create a database.
- A database account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note**
> - If you want the browser to remember the password, select **Remember password** and click **Login**.
> - If you cannot connect to the instance, check the IP address whitelist settings. For more information, see Configure a whitelist.

10.1.8. Monitoring and alerting

10.1.8.1. Set a monitoring frequency

This topic describes how to set the monitoring frequency of an ApsaraDB RDS for SQL Server instance.

Context

ApsaraDB RDS provides the following monitoring frequencies:

- Every 60 seconds
- Every 300 seconds

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Resource Monitoring** tab, click **Set Monitoring Frequency**.
6. In the **Set Monitoring Frequency** dialog box, select the required monitoring frequency.
7. Click **OK**.

10.1.8.2. View resource and engine monitoring data

The ApsaraDB RDS console provides a variety of performance metrics to monitor the status of your instances.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring and Alerts** page, select **Resource Monitoring** or **Engine Monitoring**, and select a time range to view the corresponding monitoring data. The following table describes the metrics.

Monitoring type	Metric	Description
Resource Monitoring	Disk Space (unit: MB)	The disk usage of the instance, which includes the following items: ○ Instance Size ○ Data Usage ○ Log Size ○ Temporary File Size ○ Other System File Size
	IOPS	The number of input/output operations per second (IOPS) for the instance.
	Total Connections	The total number of current connections of the instance.
	MSSQL Instance CPU Utilization (percentage in the operating system)	The CPU utilization of the instance. This includes the CPU utilization for the operating system. Unit: %.
	SQLServer Average Input/Output Traffic	The inbound and outbound traffic of the instance per second. Unit: KB.

Monitoring type	Metric	Description
Engine Monitoring	Average Transaction Frequency	The number of transactions processed per second.
	Average QPS	The number of SQL statements executed per second.
	Buffer Hit Ratio (%)	The read hit ratio of the buffer pool.
	Page Write Frequency at Check Point	The number of checkpoints written to pages per second.
	Login Frequency	The number of logons to the instance per second.
	Average Frequency of Whole Table Scans	The number of full table scans per second.
	SQL Compilations per Second	The number of SQL statements compiled per second.
	Lock Timeout Times	The number of lock timeouts on the instance per second.
	Deadlock Frequency	The number of deadlocks on the instance per second.
	Lock Wait Frequency	The number of lock waits on the instance per second.

10.1.9. Data security

10.1.9.1. Configure an IP address whitelist for an ApsaraDB RDS instance

After you create an ApsaraDB RDS instance, you must add the IP addresses or CIDR blocks that are used for database access to the IP address whitelist of the instance to ensure database security and reliability.

Context

IP address whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you maintain your IP address whitelists on a regular basis.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note** If you want to connect an ECS instance to an ApsaraDB RDS instance by using an internal endpoint, you must make sure that the two instances are in the same region and have the same network type. Otherwise, the connection fails.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks that are allowed to access the instance

and click **OK**.

> **Note**
>
> - Limits for IP address whitelists:
>   - You must separate multiple IP addresses with commas (,). A maximum of 1,000 different IP addresses can be added.
>
>   Supported formats are `0.0.0.0/0`, IP addresses such as `10.23.12.24`, or CIDR blocks such as `10.23.12.24/24`. `/24` indicates the length of the IP address prefix in the CIDR block. An IP address prefix can contain 1 to 32 bits.
>   - If an IP address whitelist is empty or contains only `0.0.0.0/0`, all IP addresses can access the ApsaraDB RDS instance. This may cause security risks to the instance. Proceed with caution.
> - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all the Elastic Compute Service (ECS) instances that are created within your Apsara Stack tenant account appear. Then, you can select the IP addresses and add them to an IP address whitelist.

10.1.9.2. Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates that are issued by certificate authorities (CAs) to the required application services. SSL is used at the transport layer to encrypt network connections and enhance the security and integrity of communication data. However, SSL increases the response time.

Precautions

- An SSL CA certificate is valid for one year. You must update the validity period of the SSL CA certificate in your application or client within one year. Otherwise, your application or client that uses encrypted network connections cannot connect to the ApsaraDB RDS instance.
- SSL encryption may cause a significant increase in CPU utilization. We recommend that you enable SSL encryption only when you want to encrypt connections from the Internet. In most cases, connections that use an internal endpoint do not require SSL encryption.
- SSL encryption cannot be disabled after it is enabled. Proceed with caution.

Enable SSL encryption

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. In the SSL Settings section, turn on **SSL Encryption**.
7. In the **Configure SSL** dialog box, select the endpoint for which you want to enable SSL encryption and click **OK**.
8. Click **Download CA Certificate** to download the SSL CA certificate files in a compressed package.

   The downloaded package contains the following files:

   - P7B file: contains the server CA certificate that can be imported into a Windows operating system.
   - PEM file: contains the server CA certificate that can be imported into an operating system rather than Windows or an application that is not Windows-based.

- JKS file: contains the server CA certificate that is stored in a Java-supported truststore. You can use the file to import the CA certificate chain into a Java-based application. The default password is apsaradb.

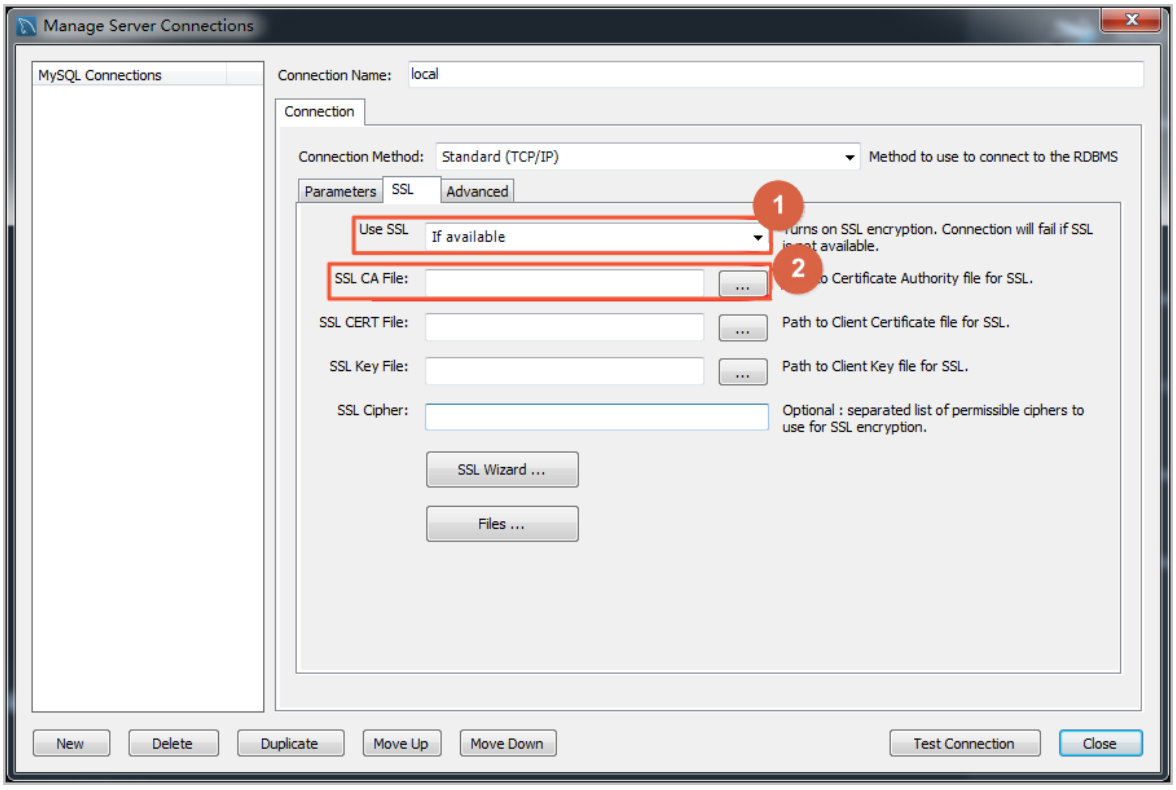
> **Note** When the JKS file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the `/jre/lib/security/java.security` file on the host where your application resides, and modify the following configurations:
>
> ```
> jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224
> jdk.certpath.dis
> abledAlgorithms=MD2, RSA keySize < 1024
> ```
>
> If you do not modify the JDK security configuration, the following error is reported. Similar errors are also caused by the Java security configuration.
>
> ```
> javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints
> ```

Configure an SSL CA certificate

After you enable SSL encryption, configure the SSL CA certificate on your application or client before they can connect to the ApsaraDB RDS instance. This section describes how to configure an SSL CA certificate. MySQL Workbench and Navicat are used in the example. If you are using other applications or clients, see the related instructions.

Configure a certificate on MySQL Workbench

1. Start MySQL Workbench.
2. Choose **Database > Manage Connections**.
3. Enable **Use SSL** and import the SSL CA certificate file.



Configure a certificate on Navicat

1. Start Navicat.

2. Right-click the database and select **Edit Connection**.
3. Click the **SSL** tab. Select the path of the PEM-formatted CA certificate, as shown in the following figure.
4. Click **OK**.

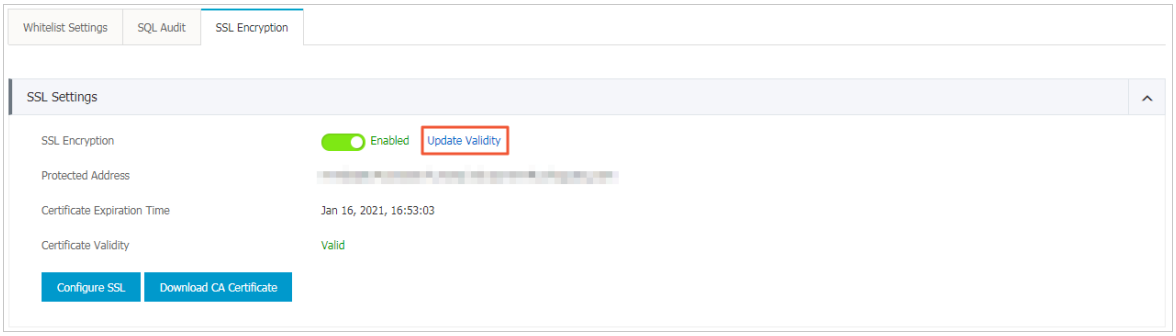
> **Note** If the `connection is being used` error is reported, the previous session is still connected. Restart Navicat.

5. Double-click the database to test whether the database is connected.

Update the validity period of an SSL CA certificate

> **Note**
> - **Update Validity** causes the ApsaraDB RDS instance to restart. Proceed with caution.
> - After you perform the **Update Validity period** operation, you must download and configure the SSL CA certificate again.

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SSL Encryption** tab.
6. Click **Update Validity**.



7. In the message that appears, click **OK**.

10.1.9.3. Configure TDE

This topic describes how to configure Transparent Data Encryption (TDE) for your ApsaraDB RDS for SQL Server instance. TDE allows your ApsaraDB RDS instance to encrypt the data that will be written into the disk and decrypt the data that will be read from the disk to the memory. TDE does not increase the sizes of data files. When you use TDE, you do not need to modify the application that uses the ApsaraDB RDS instance.

Precautions

- Instance-level TDE can be enabled but cannot be disabled. Database-level TDE can be enabled or disabled.
- The keys used for data encryption are generated and managed by Key Management Service (KMS). ApsaraDB RDS does not provide the keys or certificates used for data encryption. If you want to restore data to your computer after TDE is enabled, you must decrypt the data on your ApsaraDB RDS instance. For more information, see Decrypt data.
- TDE increases CPU utilization.

Prerequisites

- Your ApsaraDB RDS instance runs SQL Server EE.
- KMS is activated. If KMS is not activated, you can activate it as prompted when you enable TDE.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **TDE** tab.
6. Turn on **TDE Status**.
7. In the dialog box that appears, click **Confirm**.

   > **Note** If you have not enabled KMS, you are prompted to do so when you enable TDE. After you enable KMS, you can turn on **TDE Status** to enable TDE.

8. Click **Configure TDE**. In the Database TDE Settings dialog box, select the databases you want to encrypt from the Unselected Databases list, click the icon to add them to the **Selected Databases** list, and then click **OK**.

Decrypt data

If you want to decrypt a database that is encrypted by using TDE, you need only to remove the database from the Selected Databases section in the **Database TDE Settings** dialog box.

10.1.10. Service availability

10.1.10.1. Switch workloads over between primary and secondary ApsaraDB RDS instances

This topic describes how to switch workloads over between a primary ApsaraDB RDS instance and its secondary instance. ApsaraDB RDS supports both manual switchover and automatic switchover. After a switchover is complete, the primary ApsaraDB RDS instance becomes the secondary instance.

Context

- Automatic switchover: By default, the automatic switchover feature is enabled. If the primary ApsaraDB RDS instance becomes faulty, ApsaraDB RDS automatically switches workloads over to the secondary instance.
- Manual switchover: You can manually switch workloads over between the primary and secondary ApsaraDB RDS instances even when the automatic switchover feature is enabled.

> **Note** Data is synchronized in real time between the primary and secondary ApsaraDB RDS instances. You can access only the primary instance. The secondary instance serves only as a standby and does not allow external access.

Precautions

- You may encounter a network interruption during a switchover. Make sure that your application is configured to automatically reconnect to the instance.

- If the primary ApsaraDB RDS instance is attached with read-only instances, the read-only instances need to re-establish the connections that are used for data replication and synchronize incremental data after a switchover. As a result, data on the read-only instances shows latencies of a few minutes.

Perform a manual switchover

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Service Availability**.
4. Click **Switch Primary/Secondary Instance** on the right side of the page.

   > **Note** You may encounter a network interruption during a switchover. Make sure that your application is configured to automatically reconnect to the instance.

5. In the dialog box that appears, click **OK**.

   > **Note** In the dialog box, you can also select **Switch Within Maintenance Window** and click **OK**. Then, the system performs the primary/secondary switchover within the maintenance window. For more information about how to set the maintenance time, see Set a maintenance window. You can also click **Change** on the right to change the maintenance window.

FAQ

Q: Can I connect to secondary instances?

A: No, you cannot connect to secondary instances. You can connect only to primary instances. Secondary instances serve only as a standby and do not allow external access.

10.1.11. Database backup and restoration

10.1.11.1. Configure an automatic backup policy

Automatic backup supports full physical backups. ApsaraDB RDS automatically backs up data based on pre-configured policies. This topic describes how to configure a policy for automatic backup.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab.
6. Click **Edit**.
7. In the dialog box that appears, configure the automatic backup policy.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Default value: 7.

Parameter	Description
Backup Cycle	The cycle based on which you want to create a backup. You can select one or more days within a week. **Note** For data security purposes, we recommend that you back up your ApsaraDB RDS instance at least twice a week.
Backup Time	The period of time for which you want to back up data. Unit: hours.
Backup Frequency	The frequency at which you want to back up logs. The following options are available: ○ Same as Data Backup ○ Every 30 Minutes The total size of log backup files remains the same regardless of the backup frequency.

8. Click **OK**.

10.1.11.2. Manually back up an instance

This topic describes how to manually back up an ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, click **Back Up Instance** in the upper-right corner.
5. In the **Back Up Instance** dialog box, select **Automatic Backup** or **Full Backup** from the **Select Backup Mode** drop-down list.

   Note ApsaraDB RDS supports the following backup methods:
   - **Automatic Backup**: After you select Automatic Backup, the system immediately performs an incremental or full backup based on the instance.
   - **Full Backup**: After you select Full Backup, the system immediately performs a full backup.

6. Click **OK**.

Result

After the backup is complete, you can view the backup task on the **Data Backup** tab of the **Backup and Restoration** page.

10.1.11.3. Shrink transaction logs

ApsaraDB RDS for SQL Server allows you to shrink transaction logs to reduce the log file size.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Shrink Transaction Log**. In the message that appears, click **OK**.

> **Note** The shrinkage takes about 20 minutes to complete. ApsaraDB RDS for SQL Server shrinks transaction logs during each backup.

10.1.12. Migrate full backup data to ApsaraDB RDS for SQL Server

This topic describes how to migrate full backup files of an on-premises database from Object Storage Service (OSS) to ApsaraDB RDS for SQL Server.

Prerequisites

- Your ApsaraDB for RDS instance has sufficient storage space. If the space is insufficient, you must increase it before you migrate data to the instance.
- The destination database on your ApsaraDB for RDS instance has a different name from the on-premises database.
- A privileged account is created on your ApsaraDB for RDS instance. For more information, see Create an account.
- An Object Storage Service (OSS) bucket is created in the region where your ApsaraDB for RDS instance is created. For more information, see Create buckets in the *OSS User Guide*.
- The DBCC CHECKDB statement is executed, and the execution result indicates that no allocation or consistency errors occur.

> **Note** If no allocation or consistency errors occur, the following execution result is returned:

```
...
CHECKDB found 0 allocation errors and 0 consistency errors in database 'xxx'.
DBCC execution completed. If DBCC printed error messages, contact your system administrator.
```

Precautions

- Full backup files cannot be migrated to an ApsaraDB for RDS instance of an earlier SQL Server version. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, you cannot migrate full backup files of the on-premises database to your ApsaraDB for RDS instance.
- Differential or log backup files are not supported.
- The names of full backup files cannot contain special characters, such as `at signs (@) and vertical bars (|)`. If the file names contain special characters, the migration fails.
- After the service account of your ApsaraDB for RDS instance is granted the access permission on the OSS bucket, the system creates a role named **AliyunRDSImportRole** in RAM. Do not modify or delete this role. Otherwise, you cannot download full backup files when you migrate data to your ApsaraDB for RDS instance. In this case, you must re-authorize the service account of your ApsaraDB for RDS instance.
- Before the migration is complete, do not delete the backup files from the OSS bucket. Otherwise, the migration fails.

- The names of backup files can be suffixed only with bak, diff, trn, or log. If you do not use the script in this topic to generate a backup file, you must name the backup file by using one of the following suffixes:
  - bak: indicates a full backup file.
  - diff: indicates a differential backup file.
  - trn or log: indicates a log backup file.

Back up the on-premises database

> **Note** Before you perform a full backup, stop writing data to the on-premises database. The data written during the backup process is not backed up.

1. Download the backup script. Double-click the backup script to open it by using the Microsoft SQL Server Management Studio (SSMS) client.
2. Configure the following parameters.

Parameter	Description
@backup_databases_list	The databases that you want to back up. Separate them with semicolons (;) or commas (,).
@backup_type	The backup type. Valid values: ○ FULL: full backup ○ DIFF: differential backup ○ LOG: log backup
@backup_folder	The directory in which you want to store the backup files on your computer. If the specified directory does not exist, the system creates a directory.
@is_run	Specifies whether to perform a backup. Valid values: ○ 1: performs a backup. ○ 0: performs no backup but a check.

3. Run the backup script.

Upload full backup files to the OSS bucket

After the on-premises database is backed up, you must upload full backup files to the OSS bucket. You can use one of the following methods:

- Use the OSS console

  If the size of backup files is smaller than 5 GB, you can upload the files in the OSS console. For more information, see Upload objects in the *OSS User Guide*.

- Call an OSS API operation

  You can call an OSS API operation to upload the full backup files in resumable mode. For more information, see Multipart upload-relevant operations in the *OSS Developer Guide*.

Create a migration task

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Backup and Restoration**.
4. In the upper-right corner of the page, click **Migrate OSS Backup Data to RDS**.
5. Click **Next** twice until the Import Data step appears.

6. Configure the following parameters.

Parameter	Description
Database Name	Enter the name of the destination database on your ApsaraDB for RDS instance. **Note** The name of the database must meet the requirements of SQL Server.
OSS Bucket	Select the OSS bucket that stores the backup files.
OSS Subfolder Name	Enter the name of the OSS subfolder that stores the backup files.
OSS File	Click the search icon to search for backup files by using the prefix-based fuzzy match. The system displays the name, size, and update time of each backup file. Select the backup file that you want to migrate to your ApsaraDB for RDS instance.
Cloud Migration Method	**One-time Full Backup File Migration**: uploads full backup data to your ApsaraDB for RDS instance. Select this option if you want to migrate only a single full backup file.

7. Click **OK**.

Wait for the migration task to complete. You can click **Refresh** to view the latest status of the migration task. If the migration fails, fix the error based on the message displayed in the Task Description column. For more information, see Common errors.

View the migration task

In the left-side navigation pane, click **Backup and Restoration**. Click the **Backup Data Upload History** tab. The system displays the migration tasks in the last week.

Common errors

Each record of a migration task contains a task description, which helps you identify the error cause and fix the error. The following list describes common errors:

- A database with the same name as the on-premises database exists on your ApsaraDB for RDS instance.
  - Error message: The database (xxx) is already exist on RDS, please backup and drop it, then try again.
  - Cause: The on-premises database is named the same as an existing database on your ApsaraDB for RDS instance. For data security purposes, ApsaraDB RDS for SQL Server does not allow such a database to be migrated.
  - Solution: If you need to overwrite the database in your ApsaraDB for RDS instance with the on-premises database, you must back up the database, delete it from your ApsaraDB for RDS instance, and then migrate the on-premises database to your ApsaraDB for RDS instance.
- A differential backup file is used.
  - Error message: Backup set (xxx.bak) is a Database Differential backup, we only accept a FULL Backup.
  - Cause: The file that you uploaded is a differential backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- A log backup file is used.
  - Error message: Backup set (xxx.trn) is a Transaction Log backup, we only accept a FULL Backup.
  - Cause: The file that you uploaded is a log backup file, but not a full backup file. The migration solution for full backup data supports only full backup files.
- The backup file fails the verification.
  - Error message: Failed to verify xxx.bak, backup file was corrupted or newer edition than RDS.

  - Cause: The backup file is damaged, or the on-premises database runs an SQL Server version later than your ApsaraDB for RDS instance. For example, if the on-premises database runs SQL Server 2016 and your ApsaraDB for RDS instance runs SQL Server 2012, the error message is returned.
  - Solution: If the backup file is damaged, perform a full backup on the on-premises database again. If the database engine version does not meet the requirements, select an ApsaraDB for RDS instance that runs the same version as or a later version than the on-premises database.

- DBCC CHECKDB fails to be executed.
  - Error message: DBCC checkdb failed.
  - Cause: Allocation or consistency errors occurred in the on-premises database.
  - Solution: Execute the following statement in the on-premises database.

    > **Note** Data loss may occur when you use this statement to fix errors.

    ```
    DBCC CHECKDB (DBName, REPAIR_ALLOW_DATA_LOSS) WITH NO_INFOMSGS, ALL_ERRORMSGS
    ```

- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (1)
  - Error message: Not Enough Disk Space for restoring, space left (xxx MB) < needed (xxx MB).
  - Cause: The remaining storage space of your ApsaraDB for RDS instance does not meet the migration requirements.
  - Solution: Increase the storage space of your ApsaraDB for RDS instance.

- The remaining storage space of your ApsaraDB for RDS instance is insufficient. (2)
  - Error message: Not Enough Disk Space, space left xxx MB < bak file xxx MB.
  - Cause: The remaining storage space of your ApsaraDB for RDS instance is smaller than the size of the backup file.
  - Solution: Increase the storage space of your ApsaraDB for RDS instance.

- No privileged account exists.
  - Error message: Your RDS doesn't have any init account yet, please create one and grant permissions on RDS console to this migrated database (XXX).
  - Cause: No privileged account is created on your ApsaraDB for RDS instance, and the database permissions are not granted to accounts. However, when this error message is returned, the backup file has been restored to your ApsaraDB for RDS instance, and the migration task is successful.
  - Solution: Create a privileged account. For more information, see Create an account.

11.ApsaraDB RDS for PostgreSQL

11.1. User Guide(RDS PostgreSQL)

11.1.1. What is ApsaraDB RDS?

ApsaraDB RDS is a stable, reliable, and scalable online database service. Based on the distributed file system and high-performance storage, ApsaraDB RDS allows you to perform database operations and maintenance with its set of solutions for disaster recovery, backup, restoration, monitoring, and migration.

ApsaraDB RDS supports four database engines, which are MySQL, SQL Server, PolarDB, and PostgreSQL. You can create database instances based on these database engines to meet your business requirements. This topic describes the PostgreSQL engine.

ApsaraDB RDS for PostgreSQL

ApsaraDB RDS for PostgreSQL is the most advanced open source database. It is fully compatible with SQL and supports a diverse range of data formats such as JSON, IP, and geometric data. In addition to features such as transactions, subqueries, multi-version concurrency control (MVCC), and data integrity check, ApsaraDB RDS for PostgreSQL integrates a series of features including high availability, backup, and restoration to ease operation and maintenance loads.

11.1.2. Limits on ApsaraDB RDS for PostgreSQL

Before you use ApsaraDB RDS for PostgreSQL, you must understand its limits and take the necessary precautions.

The following table describes the limits on ApsaraDB RDS for PostgreSQL.

Operation	Limit
Root permissions of databases	Superuser permissions are not provided.
Database replication	ApsaraDB RDS for PostgreSQL provides a primary/secondary replication architecture except in the Basic Edition. The secondary instances in the architecture are hidden and cannot be accessed by your applications.
Instance restart	Instances must be restarted by using the ApsaraDB RDS console or API operations.

11.1.3. Log on to the ApsaraDB RDS console

This topic describes how to log on to the ApsaraDB RDS console.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. If your account has multi-factor authentication (MFA) enabled, perform corresponding operations in the following scenarios:
   - It is the first time that you log on to the console after MFA is forcibly enabled by the administrator.
     a. On the Bind Virtual MFA Device page, bind an MFA device.
     b. Enter the account and password again as in Step 2 and click **Log On**.
     c. Enter a six-digit MFA verification code and click **Authenticate**.
   - You have enabled MFA and bound an MFA device.

     Enter a six-digit MFA authentication code and click **Authenticate**.

     > **Note** For more information, see the *Bind a virtual MFA device to enable MFA* topic in *Apsara Uni-manager Operations Console User Guide*.
5. In the top navigation bar, choose **Products > Database Services > ApsaraDB RDS**.

11.1.4. Quick Start

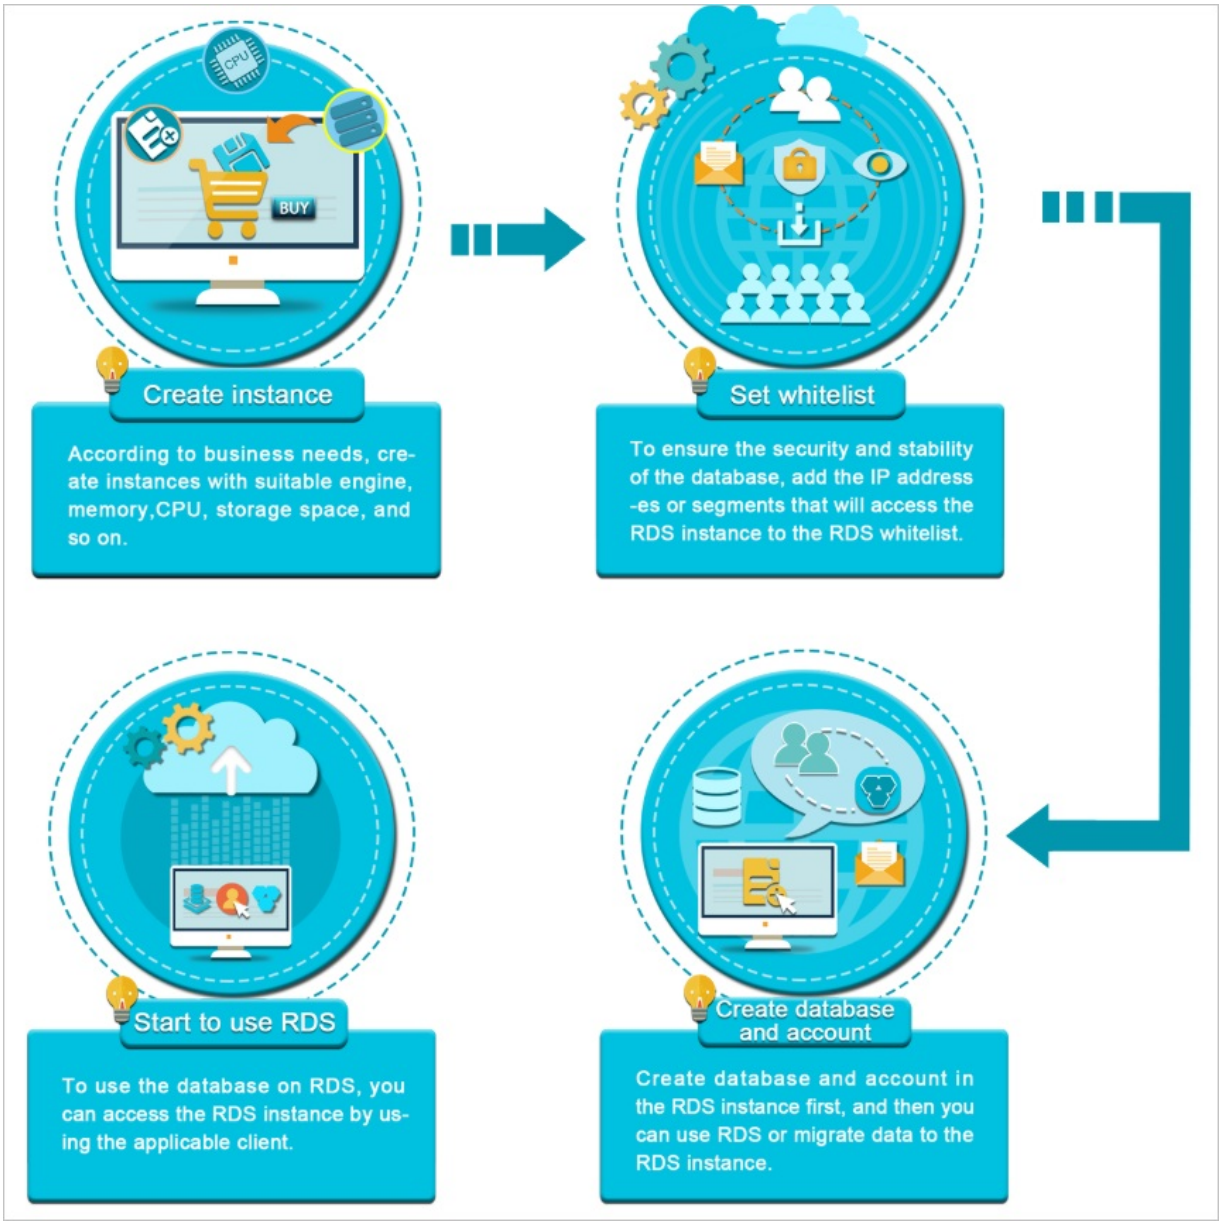
11.1.4.1. Procedure

ApsaraDB RDS quick start covers the following topics: creating an ApsaraDB RDS instance, configuring a whitelist, creating a database, creating an account, and connecting to the instance.

Flowchart for an ApsaraDB RDS instance

If you are using ApsaraDB RDS for the first time, you can start with Limits.

The following figure shows the operations that you must perform before you use an ApsaraDB RDS instance.



11.1.4.2. Create an instance

This topic describes how to create one or more ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic	**Organization**	The organization to which the instance belongs.

Settings Section	Parameter	Description
	Resource Set	The resource set to which the instance belongs.
Region	**Region**	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	**Quantity**	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **PostgreSQL**.
	Engine Version	The version of the database engine. Valid values: ○ 9.4 ○ 10.0 ○ 11.0 ○ 12.0

Section	Parameter	Description
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Local and standard SSDs are supported. **Note** Instances that run PostgreSQL 9.4 support only local SSDs.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **Standard SSD**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *Key Management Service User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. **Note** ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

11.1.4.3. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS instance. Only entities that are listed in a whitelist can access your ApsaraDB RDS instance.

Context

Whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.

  > **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities to access your ApsaraDB RDS instance.

- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance and click **OK**. The following section describes the rules:
   - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format can access your ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all ECS instances created within your Alibaba Cloud account are displayed. You can select the required IP addresses to add them to the IP address whitelist.

11.1.4.4. Create a database and an account

Before you start to use ApsaraDB RDS, you must create databases and accounts on an ApsaraDB RDS instance. This topic describes how to create a database and an account on an ApsaraDB RDS for PostgreSQL instance.

Account types

ApsaraDB RDS for PostgreSQL instances support two types of accounts: privileged accounts and standard accounts. The following table describes these account types.

Account type	Description

Account type	Description
Privileged account	• You can create and manage privileged accounts only by using the ApsaraDB RDS console or API operations. • If your ApsaraDB RDS instance uses local SSDs, you can create only a single privileged account. If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account. A privileged account allows you to manage all the standard accounts and databases that are created on your ApsaraDB RDS instance. • A privileged account has more permissions that allow you to manage your ApsaraDB RDS instance at more fine-grained levels. For example, you can grant the query permissions on different tables to different users. • A privileged account has the permissions to disconnect accounts that are created on your ApsaraDB RDS instance.
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create more than one standard account on your ApsaraDB RDS instance. • You must grant the permissions on specific databases to a standard account. • A standard account does not have the permissions to create, manage, or disconnect other accounts on your ApsaraDB RDS instance.

Precautions

- If your ApsaraDB RDS instance uses local SSDs, you can create one privileged account in the ApsaraDB RDS console. After the privileged account is created, it cannot be deleted. You can also create and manage more than one standard account by using SQL statements.
- If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account and standard account in the ApsaraDB RDS console. You can also create and manage more than one standard account by using SQL statements.
- To migrate data from an on-premises database to your ApsaraDB RDS instance, you must create a database and an account on the ApsaraDB RDS instance. Make sure that the created database has the same properties as the on-premises database. Also make sure that the created account has the same permissions on the created database as the account that is authorized to manage the on-premises database.
- Follow the least privilege principle to create accounts and grant them read-only permissions or read and write permissions on databases. If necessary, you can create more than one account and grant them only the permissions on specific databases. If an account does not need to write data to a database, grant only the read-only permissions on that database to the account.
- For security purposes, we recommend that you specify strong passwords for the accounts on your ApsaraDB RDS instance and change the passwords on a regular basis.

Create a privileged account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Privileged Account** and configure the following parameters.

Parameter	Description

Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.

6. Click **Create**.

Create a privileged or standard account on an instance that uses standard or enhanced SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Account** and configure the following parameters.

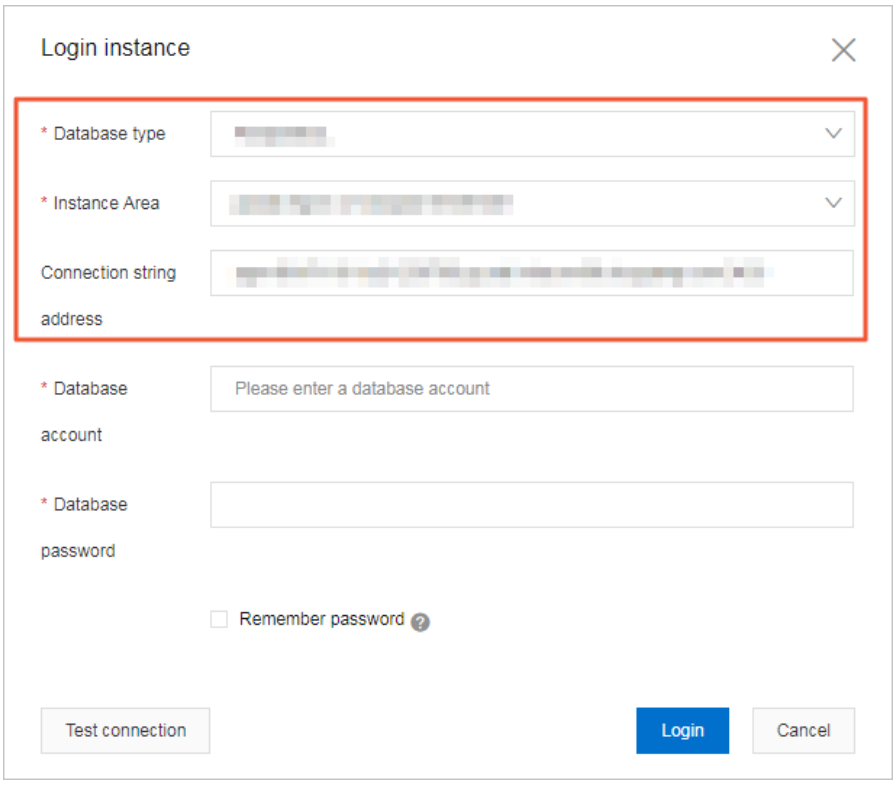
Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Account Type	Select **Privileged Account** or **Standard Account**.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.
Description	This parameter is optional. You can enter relevant description to make the instance identifiable. The description can be up to 256 characters in length.

6. Click **Create**.

Create a database and a standard account

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.

3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a database:

```
CREATE DATABASE name
 [ [ WITH ] [ OWNER [=] user_name ]
        [ TEMPLATE [=] template ]
        [ ENCODING [=] encoding ]
        [ LC_COLLATE [=] lc_collate ]
        [ LC_CTYPE [=] lc_ctype ]
        [ TABLESPACE [=] tablespace_name ]
        [ CONNECTION LIMIT [=] connlimit ] ]
```

For example, if you want to create a database named test, execute the following statement:

```
create database test;
```

8. Click **execute**.
9. In the SQL window, execute a statement in the following format to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
   SUPERUSER | NOSUPERUSER
 | CREATEDB | NOCREATEDB
 | CREATEROLE | NOCREATEROLE
 | CREATEUSER | NOCREATEUSER
 | INHERIT | NOINHERIT
 | LOGIN | NOLOGIN
 | REPLICATION | NOREPLICATION
 | CONNECTION LIMIT connlimit
 | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
 | VALID UNTIL 'timestamp'
 | IN ROLE role_name [, ...]
 | IN GROUP role_name [, ...]
 | ROLE role_name [, ...]
 | ADMIN role_name [, ...]
 | USER role_name [, ...]
 | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

10. Click **execute**.

11.1.4.5. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB RDS instance.

Context

You can log on to DMS from the ApsaraDB RDS console and then connect to an ApsaraDB RDS instance.

DMS is a data management service that integrates data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a client to connect to an ApsaraDB RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an open source PostgreSQL instance. In this topic, the pgAdmin 4 client is used to connect to an ApsaraDB RDS instance.

Use DMS to connect to an ApsaraDB RDS instance

For more information about how to use DMS to connect to an ApsaraDB RDS instance, see Log on to an ApsaraDB for RDS instance by using DMS.

Use the pgAdmin 4 client to connect to an ApsaraDB RDS instance

1. Add the IP address of the pgAdmin client to an IP address whitelist of the ApsaraDB RDS instance. For more information about how to configure a whitelist, see Configure an IP address whitelist.
2. Start the pgAdmin 4 client.

   > **Note** For information about how to download the pgAdmin 4 client, visit pgAdmin 4 (Windows).

3. Right-click **Servers** and choose **Create > Server**, as shown in the following figure.
4. On the **General** tab of the **Create - Server** dialog box, enter the name of the server, as shown in the following figure.
5. Click the **Connection** tab and enter the information of the instance, as shown in the following figure.

Parameter	Description
Host name/address	The internal endpoint of the ApsaraDB RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
Port	The internal port number that is used to connect to the ApsaraDB RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number.
Username	The name of the privileged account on the ApsaraDB RDS instance. For more information about how to obtain a privileged account, see Create a database and an account.
Password	The password of the privileged account of the ApsaraDB RDS instance.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**. If the following page appears, the connection is established.

   > **Notice** The postgres database is the default system database of the ApsaraDB RDS instance. Do not perform operations on this database.

11.1.5. Instances

11.1.5.1. Create an instance

This topic describes how to create one or more ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.

3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **PostgreSQL**.

Section	Parameter	Description
Specifications	**Engine Version**	The version of the database engine. Valid values: ○ 9.4 ○ 10.0 ○ 11.0 ○ 12.0
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Type	The storage type of the instance. Local and standard SSDs are supported. **Note** Instances that run PostgreSQL 9.4 support only local SSDs.
	Encrypted	Specifies whether to encrypt the standard SSD. This parameter is available only when **Storage Type** is set to **Standard SSD**. If you select Encrypted, you must specify the **Encryption Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Create a CMK in *Key Management Service User Guide*.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.

Section	Parameter	Description
Network	Network Type	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. Note ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

11.1.5.2. Create an ApsaraDB RDS for PostgreSQL instance that uses standard SSDs

Cloud disks are block-level data storage products provided by Alibaba Cloud for Elastic Compute Service (ECS). They provide low latency, high performance, durability, and reliability. This topic describes how to create one or more instances that use standard SSDs in the ApsaraDB RDS console.

Prerequisites

An instance that runs PostgreSQL 10.0 or later can be created.

Context

An ApsaraDB RDS instance with standard SSDs uses a distributed triplicate mechanism to ensure 99.9999999% data reliability. If service disruptions occur within a zone due to hardware faults, data in that zone is copied to an unaffected disk in another zone to ensure data availability.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, click **Create Instance** in the upper-right corner.
3. Configure the following parameters.

Section	Parameter	Description
Basic Settings	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
Region	Region	The region in which you want to create the instance. Services in different regions cannot communicate over an internal network. After the instance is created, the region cannot be changed.
	Zone of Primary Node	The zone where the primary instance is deployed.
	Deployment Method	Specifies whether to deploy the primary and secondary instances in separate zones. ApsaraDB RDS supports **Multi-zone Deployment** and **Single-zone Deployment**. If you select **Multi-zone Deployment**, you must configure **Zone of Secondary Node**.
	Zone of Secondary Node	The zone where the secondary instance is deployed. This parameter is available only when **Deployment Method** is set to **Multi-zone Deployment**. **Note** If you select the same zone for both the primary and secondary instances, the deployment is equivalent to single-zone deployment.
Specifications	Quantity	The number of ApsaraDB RDS instances that you want to create. Default value: 1.
	Instance Name	The name of the instance. ○ The name must be 2 to 64 characters in length. ○ The name must start with a letter. ○ The name can contain letters, digits, and the following special characters: _ - : ○ The name cannot start with http:// or https://.
	Connection Type	The connection type of the instance. ApsaraDB RDS instances support the following connection types: ○ **Internet**: ApsaraDB RDS instances of this connection type can be connected over the Internet. ○ **Internal Network**: ApsaraDB RDS instances of this connection type can be connected over an internal network. **Note** The value of this parameter cannot be changed after the instance is created. Proceed with caution.
	Database Engine	The database engine of the instance. Select **PostgreSQL**.
	Engine Version	The version of the database engine. Set the value to **10.0** or a later version number.
	Edition	The edition of the instance. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.

Section	Parameter	Description
	Storage Type	The storage type of the instance. Select **Standard SSD**.
	Encrypted	Specifies whether to encrypt the standard SSD. If you select Encrypted, you must specify the **Key** parameter. If you do not have a key, you must first create one in Key Management Service (KMS). For more information, see Configure data encryption. **Note** Disk encryption provides maximum protection for your data with minimal impact on your business or applications. Both the snapshots generated from encrypted disks and the disks created from those snapshots are automatically encrypted.
	Encryption Key	The key that is used to encrypt the standard SSD. This parameter is available only when you select **Encrypted**.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and the input/output operations per second (IOPS). The actual values are displayed in the console. For more information, see Instance types in *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the cloned instance, which includes the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways within a VPC. We recommend that you select VPC for improved security. **Note** ■ If you configure multi-zone deployment, you must create vSwitches for the zones of primary and secondary instances in the specified VPC. ■ If you select VPC, you must specify a VPC and a vSwitch.
	IP Address Whitelist	The IP addresses that are allowed to connect to the instance.

4. Click **Submit**.

11.1.5.3. View basic information of an instance

This topic describes how to view the details of an ApsaraDB RDS instance, such as basic information, internal network connection information, status, and configurations.

Procedure

1. Log on to the ApsaraDB RDS console.
2. Use one of the following methods to go to the **Basic Information** page of an instance:
   - On the **Instances** page, click the ID of the instance to go to the **Basic Information** page.
   - On the **Instances** page, find the instance and click **Manage** in the corresponding **Actions** column. The **Basic Information** page appears.

11.1.5.4. Restart an instance

This topic describes how to manually restart an ApsaraDB RDS instance. This applies if the number of connections exceeds the specified threshold or if an instance has performance issues.

Prerequisites

The instance is in the **Running** state.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Restart Instance**.

   > **Note** When you restart an instance, applications are disconnected from the instance. We recommend that you make appropriate service arrangements before you restart an instance. Proceed with caution.

5. In the message that appears, click **Confirm**.

11.1.5.5. Change the specifications of an instance

This topic describes how to change the specifications of an ApsaraDB RDS instance. You can upgrade or downgrade an ApsaraDB RDS instance to meet your business needs.

Prerequisites

The instance is in the **Running** state and is not in the backing up or restoring state.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configure Information** section of the **Basic Information** page, click **Change Specifications**.
5. On the **Change Specifications** page, set **Edition**, **Instance Type**, and **Storage Capacity**.
6. Click **Submit**.

11.1.5.6. Set a maintenance window

This topic describes how to set a maintenance window for an ApsaraDB RDS instance.

Context

The backend system performs maintenance on the ApsaraDB RDS instances during the maintenance window. This

ensures the stability of the ApsaraDB RDS instance. The default maintenance window is from 02:00 (UTC+8) to 06:00 (UTC+8). We recommend that you set the maintenance window to off-peak hours of your business to avoid impacts on your business.

Precautions

- An instance enters the **Maintaining Instance** state before the maintenance window to ensure stability during the maintenance process. When the instance is in this state, access to data in the database and query operations such as performance monitoring are not affected. However, except for account and database management and IP address whitelist configuration, modification operations such as upgrade, downgrade, and restart are temporarily unavailable.
- During the maintenance window, one or two network interruptions may occur. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Configuration Information** section, click **Configure** to the right of **Maintenance Window**.
5. Select a maintenance window and click **Save**.

> **Note** The maintenance window is displayed in UTC+8.

11.1.5.7. Configure primary/secondary switchover

ApsaraDB RDS provides the primary/secondary switchover feature to ensure the high availability of databases. The primary/secondary switchover is performed when the primary instance becomes unavailable. You can also manually switch your business to the secondary instance. This topic describes how to manually switch over services between a primary instance and its secondary instance.

Context

Data is synchronized in real time between the primary and secondary instances. You can access only the primary instance. The secondary instance serves only as a backup instance and does not allow external access. After the switchover, the original primary instance becomes the secondary instance.

> **Note** Network interruptions may occur during a switchover. Make sure that your applications are configured with automatic reconnection policies.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Service Availability**.
5. In the **Availability Information** section, click **Switch Primary/Secondary Instance**.
6. In the **Switch Primary/Secondary Instance** message, click **OK**.

> **Note**
> - During the switchover, operations such as managing databases and accounts and changing network types cannot be performed. Therefore, we recommend that you select Switch Within Maintenance Window.
> - For more information about how to set a maintenance window, see Set a maintenance window.

11.1.5.8. Release an instance

This topic describes how to manually release an instance.

Precautions

- Only instances in the running state can be released.
- After an instance is released, the instance data is immediately deleted. We recommend that you back up your data before you release an instance.
- When you release a primary instance, all of its read-only instances are also released.

Procedure

1. Log on to the ApsaraDB RDS console.
2. Find the instance that you want to release and choose **More > Release Instance** in the Actions column.
3. In the **Release Instance** message, click **Confirm**.

11.1.5.9. Modify parameters of an instance

This topic describes how to view and modify the values of some parameters and query parameter modification records in the console.

Precautions

- To ensure instance stability, you can modify only specific parameters in the ApsaraDB RDS console.
- When you modify parameters on the **Editable Parameters** tab, refer to the **Value Range** column corresponding to each parameter.
- After specific parameters are modified, you must restart your instance for the changes to take effect. The necessity of restart is displayed in the **Force Restart** column on the **Editable Parameters** tab. We recommend that you modify the parameters of an instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.

Modify parameters

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. Perform the following operations:

   Export the parameter settings of the instance to your computer.

   On the Editable Parameters tab, click **Export Parameters**. The parameter settings of the instance are exported as a TXT file to your computer.

   Modify and import the parameter settings.

i. After you modify parameters in the exported parameter file, click **Import Parameters** and copy the parameter settings to the field.
ii. Click **OK**.
iii. In the upper-right corner of the page, click **Apply Changes**.

> **Note**
> - If the new parameter value takes effect only after an instance restart, the system prompts you to restart the instance. We recommend that you restart the instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
> - Before the new parameter values are applied, you can click **Cancel Changes** to cancel them.

Modify a single parameter.

i. On the **Editable Parameters** tab, find the parameter that you want to modify and click the icon in the **Actual Value** column.
ii. Enter a new value based on the prompted value range.
iii. Click **Confirm**.
iv. In the upper-right corner of the page, click **Apply Changes**.

> **Note**
> - If the new parameter value takes effect only after an instance restart, the system prompts you to restart the instance. We recommend that you restart the instance during off-peak hours and make sure that your applications are configured with automatic reconnection policies.
> - Before the new parameter value is applied, you can click **Cancel Changes** to cancel it.

View the parameter modification history

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the page that appears, click the **Edit History** tab.
6. Select a time range and click **Search**.

11.1.5.10. Read-only instances

11.1.5.10.1. Overview of read-only ApsaraDB RDS for PostgreSQL instances

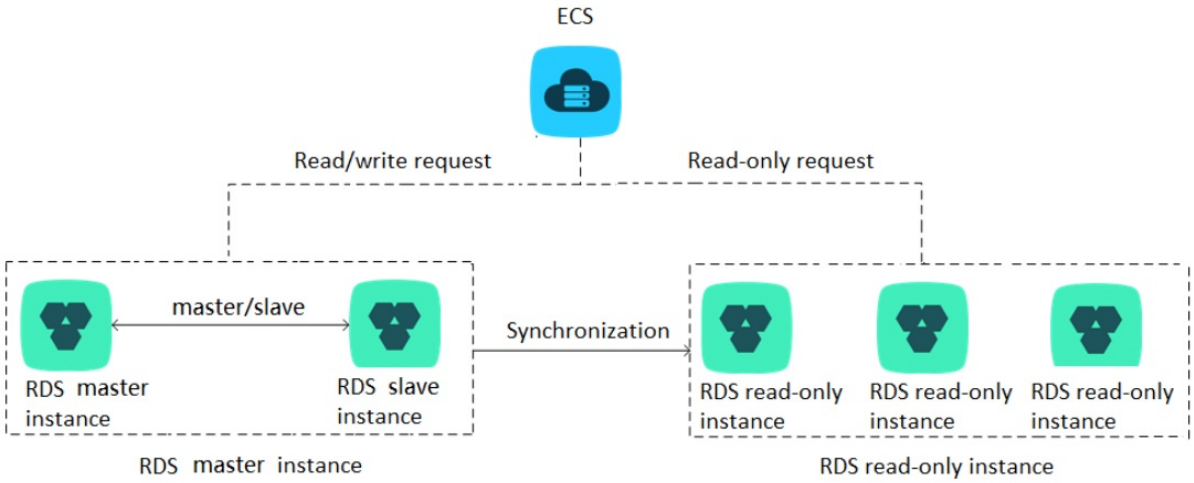
This topic provides an overview of read-only ApsaraDB RDS for PostgreSQL instances. If a large number of read requests overwhelm the primary instance, your business may be interrupted. In this case, you can create one or more read-only instances to offload read requests from the primary instance. This scales the read capability of your database system and increases the throughput of your application.

Overview

When a read-only instance is created, the data is replicated from the secondary instance. The data is consistent with that of the primary instance. Data updates of the primary instance are automatically synchronized to all read-only instances immediately after the primary instance completes operations.

> **Note**
> - Only ApsaraDB RDS instances that run PostgreSQL 10.0 support read-only instances.
> - The specifications of the primary instance must have at least eight CPU cores and 32 GB of memory.
> - Each read-only instance works in a single-node architecture, where no instances are provided as backups.

The following figure shows the topology of read-only instances.



Features

- Region and zone: Read-only instances reside within the same region as the primary instance, but possibly in different zones.
- Specifications and storage space: The specifications and storage space of read-only instances cannot be lower than those of the primary instance.
- Network type: The network type of a read-only instance can differ from that of the primary instance.
- Account and database management: Read-only instances do not require database or account maintenance, because their database and account information is synchronized with the primary instance.
- IP address whitelist: A read-only instance automatically replicates the IP address whitelists of the primary instance. However, the IP address whitelists for the read-only instance are independent of those of the primary instance. For information about how to modify the IP address whitelists of a read-only instance, see Configure an IP address whitelist.
- Monitoring and alerts: You can monitor system performance metrics, such as the disk capacity, IOPS, number of connections, and CPU utilization.

Limits

- Number of read-only instances: A maximum of five read-only instances can be created on a primary instance.
- Instance backup: Read-only instances do not support backup settings or manual backups because backups have been configured or created on the primary instance.
- Data migration: You cannot migrate data to read-only instances.
- Database management: You cannot create or delete databases on read-only instances.
- Account management: You cannot create or delete accounts, authorize accounts, or change the passwords of accounts on read-only instances.

FAQ

Q: Can I manage accounts created on the primary instance from its read-only instances?

A: No, although accounts created on the primary instance are replicated to its read-only instances, you cannot manage the accounts on the read-only instances. The accounts have only read permissions on the read-only instances.

11.1.5.10.2. Create a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to create a read-only instance for your primary ApsaraDB RDS for PostgreSQL instance. This allows your database system to process a large number of read requests and increases the throughput of your application. The data on each read-only instance is a copy of that of the primary instance. Data updates to the primary instance are synchronized to all of its read-only instances.

Prerequisites

- The primary instance runs PostgreSQL 10.0.
- The specifications of the primary instance must have at least eight CPU cores and 32 GB of memory.

Precautions

- You can create read-only instances only for your primary instance. You cannot change existing instances to read-only instances.
- When you create a read-only instance, the system replicates data from a secondary instance. Therefore, operations on your primary instance are not interrupted.
- A read-only instance does not inherit the parameter settings of the primary instance. The system generates default parameter settings for the read-only instance, and you can modify the settings in the ApsaraDB RDS console.
- The instance type and storage capacity of a read-only instance cannot be lower than that of the primary instance.
- You can create up to five read-only instances.

Create a read-only instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the Distributed by Instance Role section of the Basic Information page, click **Create Read-only Instance**.
5. On the Create Read-only Instance page, configure parameters and click **Submit**. The following table describes the parameters.

Section	Parameter	Description
Region	Region	The region where the instance is deployed.
	Database Engine	The database engine of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Engine Version	The engine version of the read-only instance, which is the same as that of the primary instance and cannot be changed.

Section	Parameter	Description
Specifications	Edition	The edition of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	Instance Type	The instance type of the read-only instance. The instance type of the read-only instance can be different from that of the primary instance, and can be changed at any time to facilitate flexible upgrade and downgrade. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same instance type as the primary instance for the read-only instance.
	Storage Capacity	The storage capacity of the read-only instance. To ensure sufficient I/O throughput for data synchronization, we recommend that you select at least the same storage capacity as the primary instance for the read-only instance.
Network Type	Network Type	The network type of the read-only instance, which is the same as that of the primary instance and cannot be changed.
	VPC	Select a VPC if the network type is set to VPC.
	vSwitch	Select a vSwitch if the network type is set to VPC.

11.1.5.10.3. View a read-only ApsaraDB RDS for PostgreSQL instance

This topic describes how to view details of a read-only ApsaraDB RDS for PostgreSQL instance. You can go to the Basic Information page of a read-only instance from the Instances page or the read-only instance list of the primary instance. Read-only instances are managed in the same manner as primary instances. The Basic Information page shows the management operations that can be performed.

View instance details of a read-only instance by using its ID

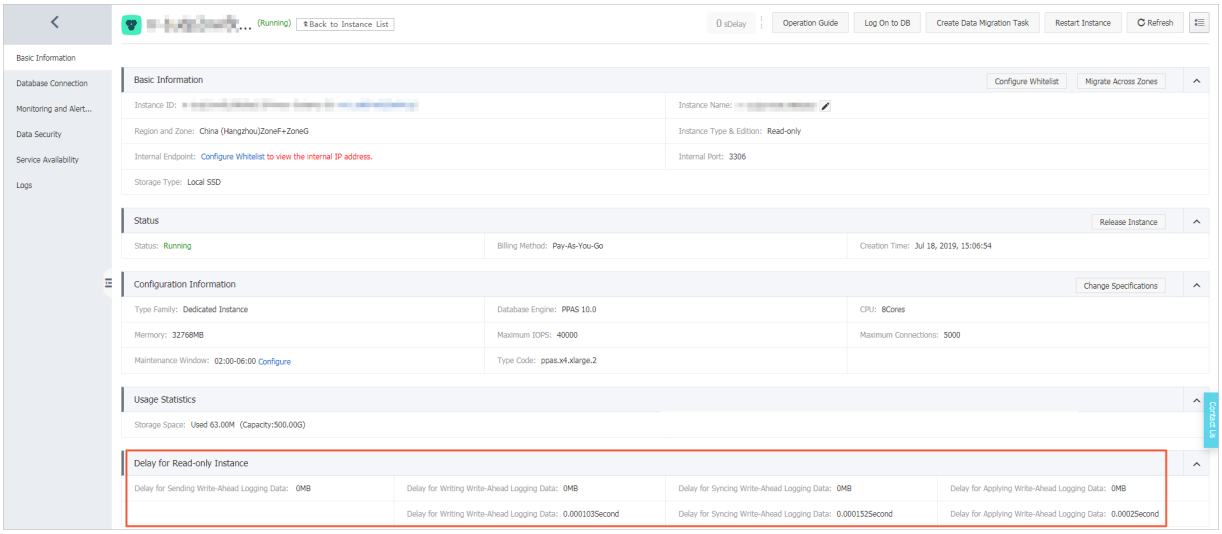
1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the instance that you want to view.
3. Click the ID of the instance or click **Manage** in the corresponding Actions column to go to the Basic Information page.

View details of a read-only instance by using the primary instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number below **Read-only Instance** in the **Distributed by Instance Role** section. The ID of the read-only instance is displayed.
5. Click the ID of the read-only instance to go to the Basic Information page of the read-only instance.

View the latency of a read-only instance

When a read-only instance synchronizes data from its primary RDS instance, latency may occur. You can navigate to the Basic Information page of the read-only instance to view the latency of data synchronization to the instance.



11.1.6. Database connection

11.1.6.1. Connect to an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use Data Management (DMS) or the pgAdmin 4 client to connect to an ApsaraDB RDS instance.

Context

You can log on to DMS from the ApsaraDB RDS console and then connect to an ApsaraDB RDS instance.

DMS is a data management service that integrates data, schema, and server management, access security, BI charts, data trends, data tracking, and performance optimization. DMS can be used to manage relational and non-relational databases, such as MySQL, SQL Server, PostgreSQL, MongoDB, and Redis. It can also be used to manage Linux servers.

You can also use a client to connect to an ApsaraDB RDS instance. ApsaraDB RDS for PostgreSQL is fully compatible with PostgreSQL. You can connect to an ApsaraDB RDS for PostgreSQL instance in a similar manner as you would connect to an open source PostgreSQL instance. In this topic, the pgAdmin 4 client is used to connect to an ApsaraDB RDS instance.

Use DMS to connect to an ApsaraDB RDS instance

For more information about how to use DMS to connect to an ApsaraDB RDS instance, see Log on to an ApsaraDB for RDS instance by using DMS.

Use the pgAdmin 4 client to connect to an ApsaraDB RDS instance

1. Add the IP address of the pgAdmin client to an IP address whitelist of the ApsaraDB RDS instance. For more information about how to configure a whitelist, see Configure an IP address whitelist.
2. Start the pgAdmin 4 client.

   > **Note** For information about how to download the pgAdmin 4 client, visit pgAdmin 4 (Windows).

3. Right-click **Servers** and choose **Create > Server**, as shown in the following figure.
4. On the **General** tab of the **Create - Server** dialog box, enter the name of the server, as shown in the following figure.

5. Click the **Connection** tab and enter the information of the instance, as shown in the following figure.

Parameter	Description
Host name/address	The internal endpoint of the ApsaraDB RDS instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
Port	The internal port number that is used to connect to the ApsaraDB RDS instance. For more information about how to view the internal port number, see View and modify the internal endpoint and port number.
Username	The name of the privileged account on the ApsaraDB RDS instance. For more information about how to obtain a privileged account, see Create a database and an account.
Password	The password of the privileged account of the ApsaraDB RDS instance.

6. Click **Save**.
7. If the connection information is correct, choose **Servers > Server Name > Databases > postgres**. If the following page appears, the connection is established.

> **Notice** The postgres database is the default system database of the ApsaraDB RDS instance. Do not perform operations on this database.

11.1.6.2. Use DMS to log on to an ApsaraDB RDS instance

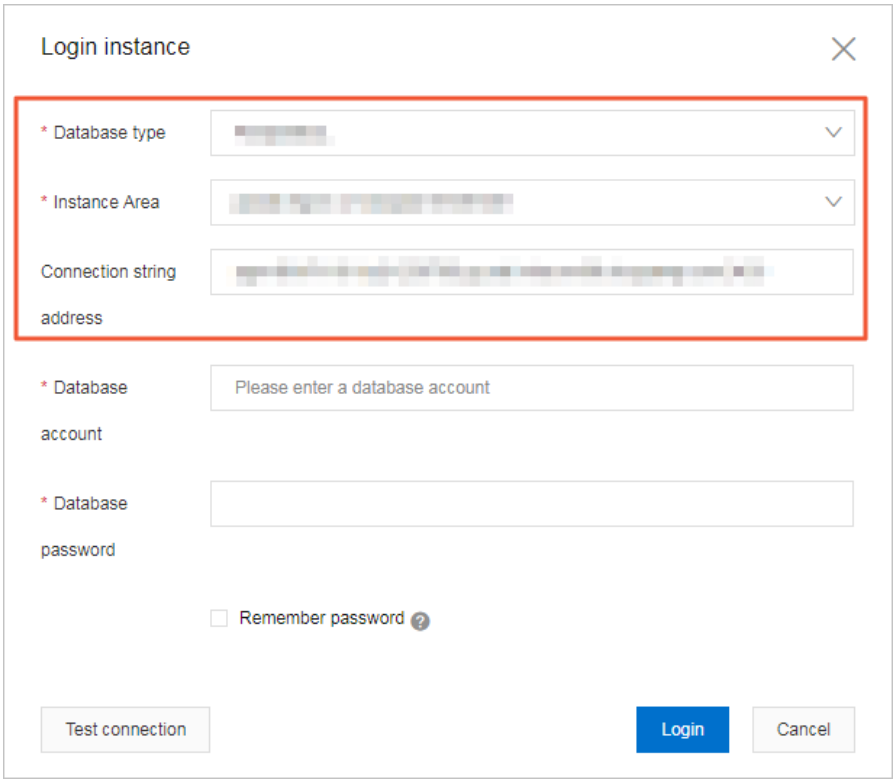
This topic describes how to use Data Management (DMS) to log on to an ApsaraDB RDS instance.

Prerequisites

The IP address whitelist is configured. For more information about how to configure an IP address whitelist, see Configure an IP address whitelist.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**.

> **Note** If you want the browser to remember the password, select **Remember password** before you click **Login**.

11.1.6.3. View and modify the internal endpoint and port number

You must use the internal endpoint and port number to access an ApsaraDB RDS instance. This topic describes how to view and modify the internal endpoint and port number of an ApsaraDB RDS instance in the ApsaraDB RDS console.

View the internal endpoint and port number

1. Log on to the ApsaraDB RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the **Basic Information** section, view the internal endpoint and port number of the instance.

Modify the internal endpoint and port number

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the right side of the page, click **Change Endpoint**.
6. In the dialog box that appears, set **Connection Type** to **Internal Endpoint**.
7. Modify the endpoint prefix and port number and click **OK**.

FAQ

- Q: Do I need to modify the endpoint or port number in my application after I modify the endpoint or port number of an instance?

  A: Yes, you must modify the endpoint or port number in the application after you modify them. Otherwise, the application cannot connect to databases of the instance.
- Q: Does the modification of the endpoint take effect immediately? Do I need to restart the instance?

  A: No, you do not need to restart the instance. The modification takes effect immediately.

11.1.7. Accounts

11.1.7.1. Create an account

Before you start to use ApsaraDB RDS, you must create an account on an ApsaraDB RDS instance. This topic describes how to create an account on an ApsaraDB RDS for PostgreSQL instance.

Account types

ApsaraDB RDS for PostgreSQL instances support two types of accounts: privileged accounts and standard accounts. The following table describes these account types.

Account type	Description
Privileged account	• You can create and manage privileged accounts only by using the ApsaraDB RDS console or the API. • If your ApsaraDB RDS instance uses local SSDs, you can create only a single privileged account. If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account. A privileged account allows you to manage all the standard accounts and databases that are created on your ApsaraDB RDS instance. • A privileged account has more permissions that allow you to manage your ApsaraDB RDS instance at more fine-grained levels. For example, you can grant the query permissions on different tables to different users. • A privileged account has the permissions to disconnect accounts that are created on your ApsaraDB RDS instance.

Account type	Description
Standard account	• You can create and manage standard accounts by using the ApsaraDB RDS console, API operations, or SQL statements. • You can create more than one standard account on your ApsaraDB RDS instance. • You must grant the permissions on specific databases to a standard account. • A standard account does not have the permissions to create, manage, or disconnect other accounts on your ApsaraDB RDS instance.

Precautions

- If your ApsaraDB RDS instance uses local SSDs, you can create one privileged account in the ApsaraDB RDS console. After the privileged account is created, it cannot be deleted. You can also create and manage more than one standard account by using SQL statements.
- If your ApsaraDB RDS instance uses standard or enhanced SSDs, you can create more than one privileged account and standard account in the ApsaraDB RDS console. You can also create and manage more than one standard account by using SQL statements.
- To migrate data from an on-premises database to your ApsaraDB RDS instance, you must create a database and an account on the ApsaraDB RDS instance. Make sure that the created database has the same properties as the on-premises database. Also make sure that the created account has the same permissions on the created database as the account that is authorized to manage the on-premises database.
- Follow the least privilege principle to create accounts and grant them read-only permissions or read and write permissions on databases. If necessary, you can create more than one account and grant them only the permissions on specific databases. If an account does not need to write data to a database, grant only the read-only permissions on that database to the account.
- For security purposes, we recommend that you specify strong passwords for the accounts on your ApsaraDB RDS instance and change the passwords on a regular basis.

Create a privileged account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Privileged Account** and configure the following parameters.

Parameter	Description
Database Account	◦ The name of the account must be 2 to 16 characters in length. ◦ The name can contain lowercase letters, digits, and underscores (_). ◦ The name must start with a letter and end with a letter or digit.
Password	◦ The password of the account must be 8 to 32 characters in length. ◦ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.characters. ◦ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.

6. Click **Create**.

Create a privileged or standard account on an instance that uses standard or enhanced SSDs

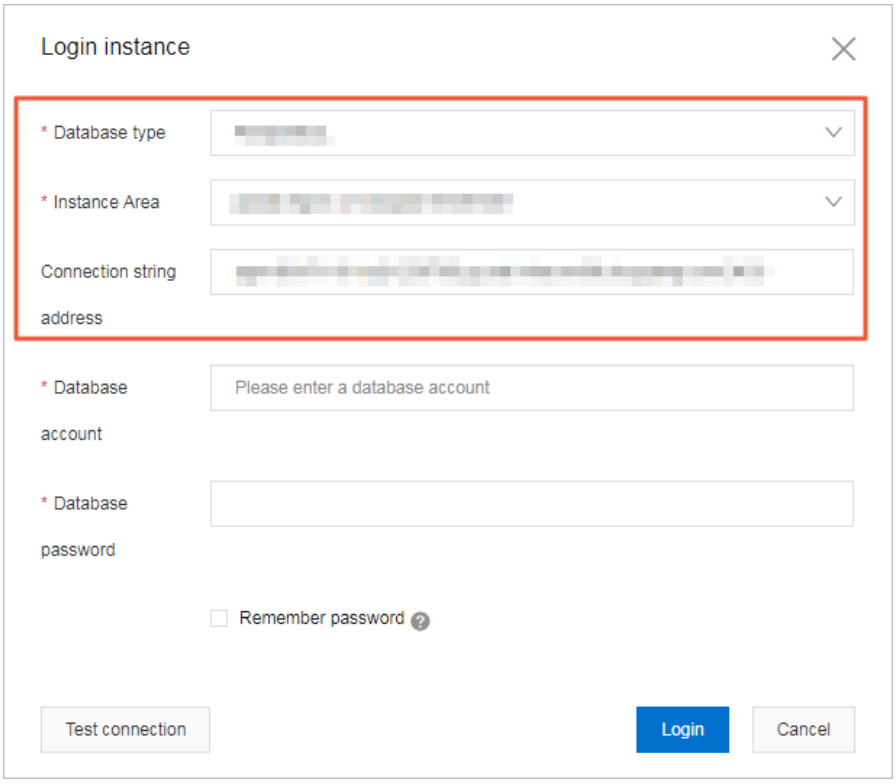
1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. On the Accounts page, click **Create Account** and configure the following parameters.

Parameter	Description
Database Account	○ The name of the account must be 2 to 16 characters in length. ○ The name can contain lowercase letters, digits, and underscores (_). ○ The name must start with a letter and end with a letter or digit.
Account Type	Select **Privileged Account** or **Standard Account**.
Password	○ The password of the account must be 8 to 32 characters in length. ○ The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters.characters. ○ Special characters include ! @#$%^&*()_+-=
Re-enter Password	Enter the password of the account again.
Description	This parameter is optional. You can enter relevant description to make the instance identifiable. The description can be up to 256 characters in length.

6. Click **Create**.

Create a standard account on an instance that uses local SSDs

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a standard account:

```
CREATE USER name [ [ WITH ] option [ ... ] ]
where option can be:
    SUPERUSER | NOSUPERUSER
  | CREATEDB | NOCREATEDB
  | CREATEROLE | NOCREATEROLE
  | CREATEUSER | NOCREATEUSER
  | INHERIT | NOINHERIT
  | LOGIN | NOLOGIN
  | REPLICATION | NOREPLICATION
  | CONNECTION LIMIT connlimit
  | [ ENCRYPTED | UNENCRYPTED ] PASSWORD 'password'
  | VALID UNTIL 'timestamp'
  | IN ROLE role_name [, ...]
  | IN GROUP role_name [, ...]
  | ROLE role_name [, ...]
  | ADMIN role_name [, ...]
  | USER role_name [, ...]
  | SYSID uid
```

For example, if you want to create a user account named test2 whose password is 123456, execute the following statement:

```
create user test2 password '123456';
```

8. Click **execute**.

11.1.7.2. Reset the password

This topic describes how to use the ApsaraDB RDS console to reset the password of your database account if you forget the password.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. In the **Actions** column corresponding to the account, click **Reset Password**.
6. In the dialog box that appears, enter a new password and click **OK**.

> **Note** The password must meet the following requirements:
>
> - The password must be 8 to 32 characters in length.
> - The password must contain at least three of the following characters: uppercase letters, lowercase letters, digits, and special characters.
> - Special characters include ! @ # $ % ^ & * ( ) _ + - =

11.1.7.3. Lock an account

You can lock a database account in the ApsaraDB RDS console to make the account unavailable.

Procedure

1. Log on to the ApsaraDB RDS console.

2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Accounts**.
5. Find the account that you want to lock and click **Lock** in the **Actions** column.
6. To unlock the account, click **Unlock** in the **Actions** column.

11.1.7.4. Delete an account

You can delete a database account in the ApsaraDB RDS console.

Prerequisites

You can use the console to delete privileged and standard accounts that are no longer used.

Procedure

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, click **Accounts**.
4. Find the account that you want to delete and click **Delete** in the Actions column.
5. In the message that appears, click **Confirm**.

> **Note** Accounts in the **Processing** state cannot be deleted.

11.1.8. Databases

11.1.8.1. Create a database

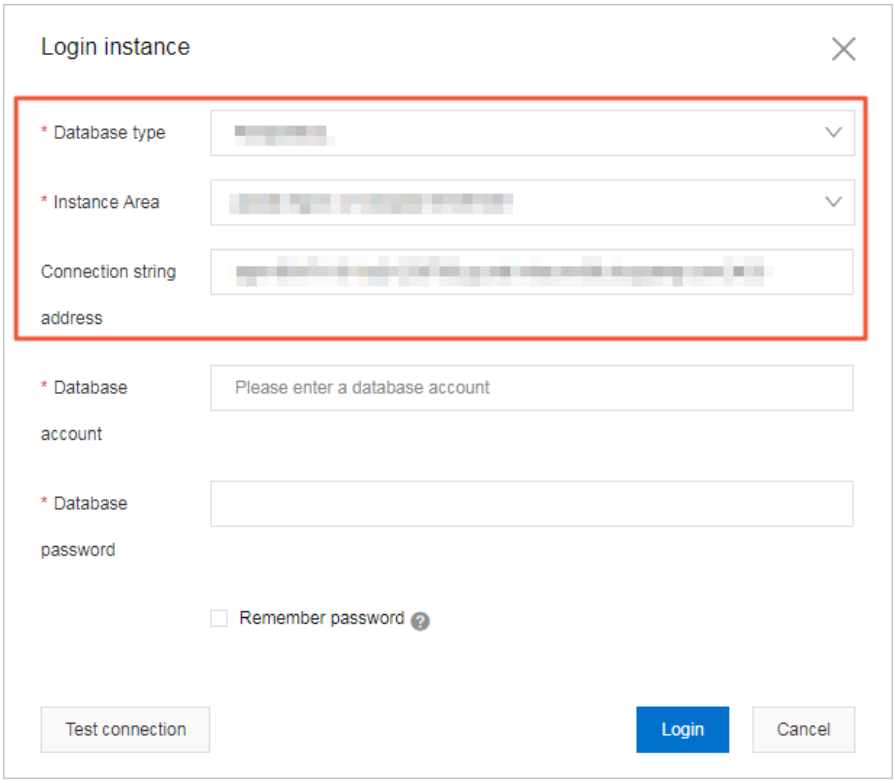
Before you start to use ApsaraDB RDS, you must create a database on an ApsaraDB RDS instance. This topic describes how to create a database on an ApsaraDB RDS for PostgreSQL instance.

Prerequisites

- An ApsaraDB RDS for PostgreSQL instance is created. For more information, see Create an instance.
- An account is created. For more information, see Create an account.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click **Login**.

   > **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute a statement in the following format to create a database:

   ```
   CREATE DATABASE name;
   ```

   For example, if you want to create a database named test, execute the following statement:

   ```
   create database test;
   ```

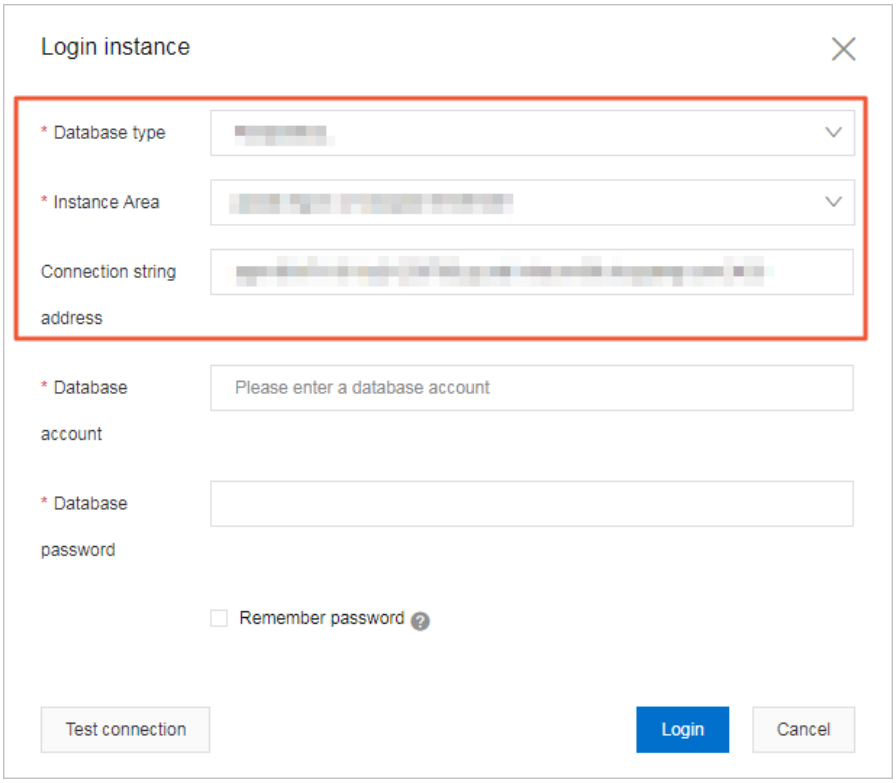
8. Click **execute**.

11.1.8.2. Delete a database

This topic describes how to delete a database in the ApsaraDB RDS for PostgreSQL console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. Click **Log On to DB** in the upper-right corner of the page.
5. In the **Login instance** dialog box of the **DMS** console, check values of **Database type**, **Instance Area**, and **Connection string address**. If the information is correct, enter **Database account** and **Database password**, as shown in the following figure.



Parameter	Description
Database type	The engine of the database. By default, the engine of the database to be connected is displayed.
Instance Area	The region where the instance is deployed. By default, the region of the current instance is displayed.
Connection string address	The endpoint of the instance. By default, the endpoint of the current instance is displayed.
Database account	The account of the database to be connected.
Database password	The password of the account used to connect to the database.

6. Click **Login**. If you want the browser to remember the password, select **Remember password** before you click

Login.

> **Note** If a message prompts you that the connection fails, the problem may be caused by an improperly configured whitelist. Reconfigure the whitelist in the console. For more information, see Configure an IP address whitelist.

7. The **SQLConsole** page appears after you log on to the instance. Execute the following statement to delete a database:

```
drop database <database name>;
```

For example, if you want to delete a database named test2, execute the following statement:

```
drop database test2;
```

8. Click **execute**.

11.1.9. Networks, VPCs, and vSwitches

11.1.9.1. Change the VPC and vSwitch for an ApsaraDB RDS for PostgreSQL instance

This topic describes how to change the virtual private cloud (VPC) and vSwitch for an ApsaraDB RDS for PostgreSQL instance.

Prerequisites

The ApsaraDB RDS for PostgreSQL instance resides in a VPC.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch vSwitch**.
6. Select a VPC and a vSwitch, and then click **OK**.

> **Note** If you want to create a VPC and a vSwitch, you can click **go to the VPC console**.

7. In the message that appears, click **Switch**.

> **Note**
> - You may encounter a network interruption of about 30 seconds during the change process. Make sure that your application is configured to automatically reconnect to the instance.
> - We recommend that you clear the cache immediately after the VPC and vSwitch are changed. Otherwise, data can be read but not written.

11.1.9.2. Change the network type of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to change the network type of an ApsaraDB RDS for PostgreSQL instance between classic network and Virtual Private Cloud (VPC).

Prerequisites

The ApsaraDB RDS instance uses local SSDs.

Context

- Classic network: ApsaraDB RDS instances in the classic network are not isolated. You can block unauthorized access only by configuring IP address whitelists on these instances.
- VPC: Each VPC is an isolated network. We recommend that you use the VPC network type because it provides a higher security level.

  You can configure route tables, CIDR blocks, and gateways within a VPC. To smoothly migrate applications to the cloud, you can use the leased line or VPN method to create a virtual data center that consists of your self-managed data center and a VPC.

Change the network type from VPC to classic network

Precautions

- The ApsaraDB RDS instance must be in a VPC.
- After you change the network type from VPC to classic network, the internal endpoint of the ApsaraDB RDS instance remains unchanged. However, the IP address that is associated with the internal endpoint changes.
- After you change the network type from VPC to classic network, you cannot connect Elastic Compute Service (ECS) instances deployed in VPCs to the ApsaraDB RDS instance by using the internal endpoint. You must update the endpoint for the applications deployed on the ECS instances.
- You may encounter a network interruption of about 30 seconds during the change process. To avoid business interruptions, we recommend that you change the network type during off-peak hours or make sure that your application is configured to automatically reconnect to the instance.

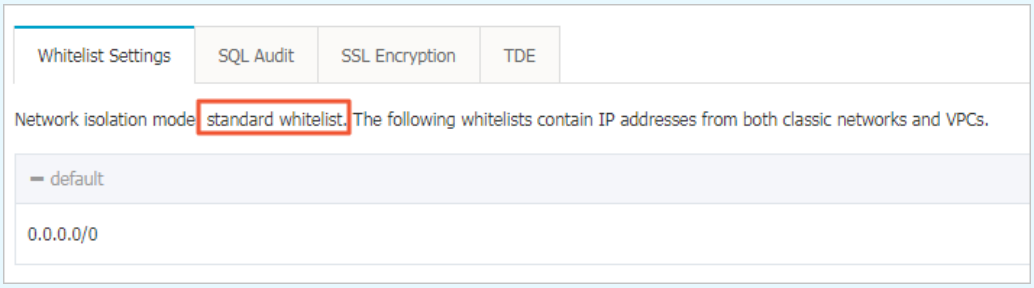
1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to Classic Network**.
6. In the message that appears, click **OK**.

   > **Note** After the network type is changed to classic network, only ECS instances within the classic network can connect to the ApsaraDB RDS instance by using the internal endpoint. You must configure the internal endpoint for the ECS instances.

7. Configure an IP address whitelist to allow ECS instances within the classic network to connect to the ApsaraDB RDS instance by using the internal endpoint.

Note

- If the network isolation mode of the ApsaraDB RDS instance is standard whitelist, add the internal IP addresses of the ECS instances to a whitelist of your ApsaraDB RDS instance.



- If the network isolation mode of the ApsaraDB RDS instance is enhanced whitelist, add the internal IP addresses of the ECS instances to a whitelist of the classic network type. If no whitelists of the classic network type are available, create a whitelist. For more information about the enhanced whitelist mode, see Switch to the enhanced whitelist mode.

Change the network type from classic network to VPC

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. In the upper-right corner of the Database Connection section, click **Switch to VPC**.
6. In the Switch to VPC dialog box, select a VPC and a vSwitch and specify whether to retain the classic network endpoint.

> **Note**
>
> - Select a VPC. We recommend that you select the VPC where your ECS instances are deployed. Otherwise, the ECS instances cannot communicate with the ApsaraDB RDS instance over the internal network.
> - Select a vSwitch. If no vSwitches are available in the selected VPC, create one in the same zone where the ApsaraDB RDS instance is deployed. For more information, see Create a vSwitch in *Virtual Private Cloud User Guide*.
> - Clear or select the **Reserve Original Classic Network Endpoint** check box.
>   - **Clear the Reserve Original Classic Network Endpoint check box**
>
>   The classic network endpoint is not retained and changes to a VPC endpoint.
>
>   When you change the network type from classic network to VPC, a network interruption of 30 seconds occurs. In this case, ECS instances located in the classic network are disconnected from your ApsaraDB RDS instance.
>   - **Select the Reserve Original Classic Network Endpoint check box**
>
>   The classic network endpoint is retained, and a new VPC endpoint is generated. In this case, your ApsaraDB RDS instance runs in hybrid access mode. Both ECS instances located in the classic network and ECS instances located in the selected VPC can access your ApsaraDB RDS instance over an internal network. You must set **Expiration Time (Important)** to **14 Days Later**, **30 Days Later**, **60 Days Later**, or **120 Days Later** for the classic network. You can also modify the expiration date after the network type is changed. For more information, see Configure hybrid access from both the classic network and VPCs.
>
>   When you change the network type from classic network to VPC, no network interruptions occur. ECS instances located in the classic network are still connected with your ApsaraDB RDS instance until the classic network endpoint expires.
>
>   Before the classic network endpoint expires, you must add the new VPC endpoint to your applications that run on the ECS instances located in the selected VPC. This allows ApsaraDB RDS to migrate your workloads to the selected VPC without network interruptions. Seven days before the classic network endpoint expires, the system sends a text message to the phone number bound to your Apsara Stack tenant account every day.
>
>   For more information, see Hybrid access from both the classic network and VPCs.

7. Add the internal IP addresses of ECS instances located in the selected VPC to an IP address whitelist of the VPC network type. This allows the ECS instances to connect to your ApsaraDB RDS instance over an internal network. If no IP address whitelists of the VPC network type are available, create one.

> **Note**
>
> - If you retain the classic network endpoint, add the VPC endpoint to the ECS instances before the classic network endpoint expires.
> - If you do not retain the classic network endpoint, connections between ECS instances in the classic network and the ApsaraDB RDS instance over the internal network are interrupted. You must add the VPC endpoint to ECS instances in the VPC immediately after the network type is changed.

11.1.9.3. Configure hybrid access from both the classic network and VPCs

This topic describes how to use the hybrid access solution of ApsaraDB RDS to change the network type of an instance from classic network to Virtual Private Cloud (VPC) without network interruptions.

Prerequisites

- The ApsaraDB RDS instance uses local SSDs.
- The ApsaraDB RDS instance is deployed in the classic network.
- Available VPCs and vSwitches exist in the zone where the ApsaraDB RDS instance is deployed.

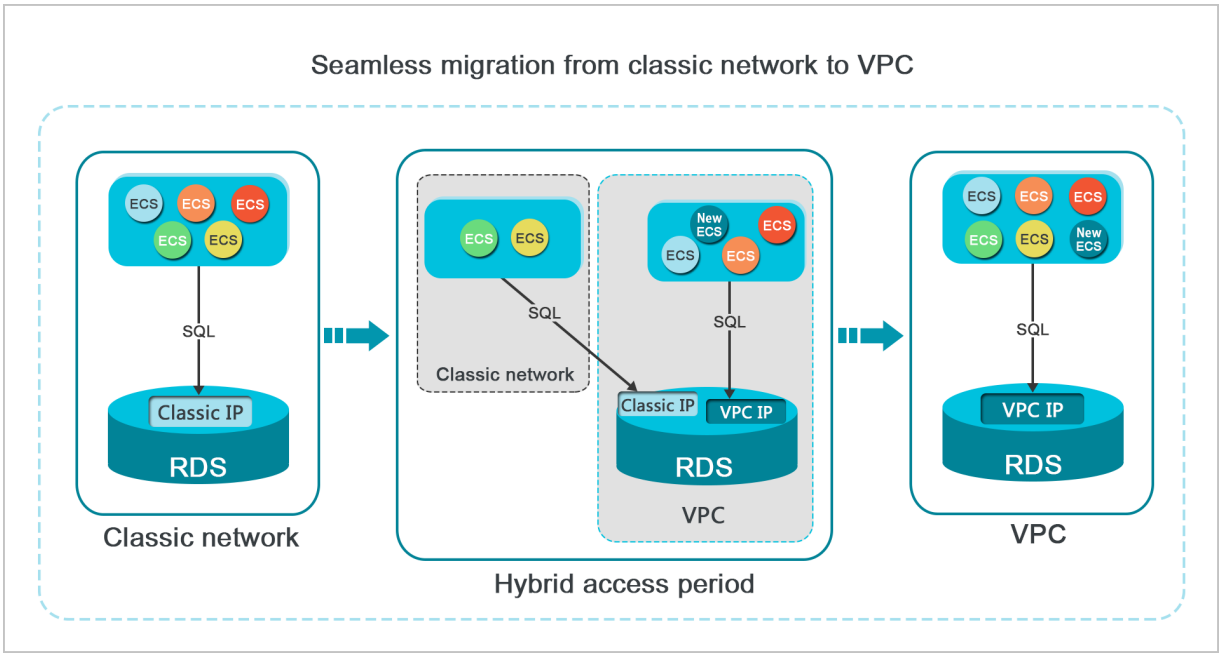
Context

In the past, when you change the network type of an ApsaraDB RDS instance from classic network to VPC, the internal endpoint of the ApsaraDB RDS instance would remain the same but the IP address bound to the endpoint would change to the corresponding IP address in the VPC. This change would cause a 30-second network interruption, and ECS instances within the classic network would not be able to access the ApsaraDB RDS instance by using the internal endpoint within this period. To smoothly change the network type, ApsaraDB RDS provides the hybrid access solution.

Hybrid access refers to the ability of an ApsaraDB RDS instance to be accessed by ECS instances in both the classic network and VPCs. During the hybrid access period, the ApsaraDB RDS instance reserves the original internal endpoint of the classic network and adds the internal endpoint of VPCs. This prevents network interruptions during the network type switchover.

For better security and performance, we recommend that you use the internal endpoint of VPCs. Hybrid access is available for a limited period of time. The internal endpoint of the classic network is released when the hybrid access period expires. In that case, your applications cannot access the ApsaraDB RDS database by using the internal endpoint of the classic network. You must configure the internal endpoint of VPCs in all your applications during the hybrid access period. This ensures smooth network switchover and minimizes the impact on your services.

For example, your company wants to use the hybrid access solution to change the network type from classic network to VPC. During the hybrid access period, some applications can access the database by using the internal endpoint of VPCs, and the other applications can access the database by using the original internal endpoint of the classic network. When all the applications access the database by using the internal endpoint of VPCs, the internal endpoint of the classic network can be released. The following figure illustrates the scenario.



Limits

During the hybrid access period, the instance has the following limits:

- The network type of your instance cannot be changed to classic network.
- Your instance cannot be migrated to another zone.

Change the network type from classic network to VPC

For more information, see Change the network type from classic network to VPC.

Change the expiration time for the original internal endpoint of the classic network

During the period in which your instance can be accessed over the classic network or VPCs, you can specify the expiration time for the endpoint of the classic network. The setting takes effect immediately. For example, if the endpoint of the classic network is about to expire on August 18, 2017 and you change the expiration time to 14 days later on August 15, 2017, the endpoint of the classic network is released on August 29, 2017.

To change the expiration time, perform the following steps:

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Database Connection**.
5. On the **Instance Connection** tab, click **Change Expiration Time**.
6. In the **Change Expiration Time** dialog box, select an expiration time and click **OK**.

11.1.10. Monitoring

11.1.10.1. View monitored resources

ApsaraDB RDS provides a wide range of performance metrics. This topic describes how to view resource monitoring data in the ApsaraDB RDS console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Monitoring and Alerts**.
5. On the **Monitoring** tab, select a time range to query the corresponding monitoring data. The following table lists the specific metrics.

Metric	Description
CPU Utilization	The CPU utilization of the instance. Unit: %.
Memory Usage	The memory usage of the instance. Unit: %.
IOPS	The number of input and output operations that are performed per second.
Disk Space Used	The used disk space of the instance. Unit: MB.
Received Traffic	The inbound and outbound bandwidths of the instance.
Data Disk Usage	The data disk usage of the instance. Unit: %.

> **Note** You can click **Refresh** in the upper-right corner of the **Monitoring** tab to refresh the monitoring information.

11.1.11. Data security

11.1.11.1. Switch to the enhanced whitelist mode

This topic describes how to switch from the standard whitelist mode to the enhanced whitelist mode for an ApsaraDB RDS instance. The enhanced whitelist mode provides higher security.

Network isolation modes

ApsaraDB RDS instances support the following network isolation modes:

- Standard whitelist mode

  IP addresses from both the classic network and virtual private clouds (VPCs) are added to the same IP address whitelist. The standard whitelist mode may incur security risks. Therefore, we recommend that you switch the network isolation mode to enhanced whitelist.

- Enhanced whitelist mode

  An enhanced IP address whitelist can contain only the IP addresses from the classic network or VPCs. When you create an enhanced IP address whitelist, you must specify its network type.

Changes after you switch to the enhanced whitelist mode

- If your ApsaraDB RDS instance resides in a VPC, an IP address whitelist of the VPC network type is automatically created. The new IP address whitelist contains all IP addresses that are replicated from the original IP address whitelists.
- If your ApsaraDB RDS instance resides in the classic network, an IP address whitelist of the classic network type is automatically created. The new IP address whitelist contains all IP addresses that are replicated from the original IP address whitelists.
- If your ApsaraDB RDS instance runs in hybrid access mode, two identical IP address whitelists are created: an IP address whitelist of the VPC network type and an IP address whitelist of the classic network type. Both the new IP address whitelists contain all IP addresses that are replicated from the original IP address whitelists. For more information, see Hybrid access from both the classic network and VPCs.

> **Note** After you switch to the enhanced whitelist mode, the IP addresses that come from Elastic Compute Service (ECS) security groups remain unchanged.

Precautions

- You can switch from the standard whitelist mode to the enhanced whitelist mode for ApsaraDB RDS instances that use local SSDs, but not the other way around.
- In enhanced whitelist mode, an IP address whitelist of the classic network type can also be used to allow access over the Internet. If you want to access your ApsaraDB RDS instance from a host over the Internet, you must add the public IP address of the host to an IP address whitelist of the classic network type.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.

5. On the **Whitelist Settings** tab, click **Switch to Enhanced Whitelist (Recommended)**.
6. In the message that appears, click **Confirm**.

11.1.11.2. Configure an IP address whitelist

This topic describes how to configure a whitelist for an ApsaraDB RDS instance. Only entities that are listed in a whitelist can access your ApsaraDB RDS instance.

Context

Whitelists make your ApsaraDB RDS instance more secure and do not interrupt the operations of your ApsaraDB RDS instance when you configure whitelists. We recommend that you perform maintenance on your whitelists on a regular basis.

To configure a whitelist, perform the following operations:

- Configure a whitelist: Add IP addresses to allow them to connect to the ApsaraDB RDS instance.

  > **Note** The IP address whitelist labeled default contains only the default IP address 0.0.0.0/0, which allows all entities to access your ApsaraDB RDS instance.

- Configure an ECS security group: Add an ECS security group for the ApsaraDB RDS instance to allow ECS instances in the group to connect to the ApsaraDB RDS instance.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. On the **Whitelist Settings** tab, click **Edit** corresponding to the **default** whitelist.

   > **Note** You can also click **Create Whitelist** to create a whitelist.

6. In the **Edit Whitelist** dialog box, enter the IP addresses or CIDR blocks used to access the instance and click **OK**. The following section describes the rules:
   - If you enter the CIDR block 10.10.10.0/24 in the IP Addresses field, all IP addresses in the 10.10.10.X format can access your ApsaraDB RDS instance.
   - If you enter more than one IP address or CIDR block, you must separate them with commas (,). Do not add spaces before or after the commas. Example: 192.168.0.1,172.16.213.9.
   - If you click **Add Internal IP Addresses of ECS Instances**, the IP addresses of all ECS instances created within your Alibaba Cloud account are displayed. You can select the required IP addresses to add them to the IP address whitelist.

11.1.11.3. Configure SSL encryption

This topic describes how to configure SSL encryption for an ApsaraDB RDS instance.

Prerequisites

The ApsaraDB RDS instance uses standard SSDs.

Precautions

- After SSL encryption is enabled, SSL is used to encrypt all the data that is transmitted over an internal network

or the Internet. SSL encryption protects the data in transit from being leaked.

- After SSL encryption is enabled, you must close the existing connection and establish a new one to bring SSL encryption into effect.

Enable SSL encryption

SSL 3.0 has been upgraded by the Internet Engineering Task Force (IETF) to Transport Layer Security (TLS), but the term SSL encryption is still commonly used in the communications industry. Therefore, SSL encryption is used in this topic to refer to TLS encryption.

> **Note** ApsaraDB RDS supports TLS 1.0, 1.1, and 1.2.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the **Editable Parameters** tab, find the ssl parameter and click the icon in the **Actual Value** column.
6. Change the value of ssl to **ON** and wait for the system to enable SSL encryption.

> **Note** After SSL encryption is enabled, you must set the SSL mode to **Prefer** when you log on from your client.

Disable SSL encryption

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Parameters**.
5. On the **Editable Parameters** tab, find the ssl parameter and click the icon in the **Actual Value** column.
6. Change the value of ssl to **OFF** and wait for the system to disable SSL encryption.

11.1.11.4. Configure data encryption

This topic describes how to configure data encryption for an ApsaraDB RDS instance that uses standard or enhanced SSDs. The disk encryption feature maximizes the protection for your data and eliminates the need to modify business or application configurations. ApsaraDB RDS automatically applies disk encryption to both the snapshots that are generated from the encrypted SSDs and the SSDs that are created from those snapshots.

Prerequisites

The storage type of the instance is standard SSD.

Configure disk encryption

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

> **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
>
> - Uppercase or lowercase letters
> - Digits
> - Special characters, which include ! @ # $ %

3. Click **Log On**.
4. In the top navigation bar, choose **Products** > Security > Key Management Service.
5. On the Keys page, click **Create Key**.
6. Configure the following parameters.

Section	Parameter	Description
Region	**Organization**	The organization to which the key belongs.
	Resource Set	The resource set to which the key belongs.
	Region	The region to which the key belongs.
Basic Settings	**Key Type**	KMS supports the following key types: ○ Symmetric keys: ■ Aliyun_AES_256 ■ Aliyun_SM4 ○ Asymmetric keys: ■ RSA_2048 ■ EC_P256 ■ EC_P256K ■ EC_SM2
	Key Purpose	ENCRYPT/DECRYPT: The purpose of the CMK is to encrypt or decrypt data.
	Protection Level	○ SOFTWARE: Use a software module to protect the CMK. ○ HSM: Host the CMK in a hardware security module (HSM). Managed HSM uses the HSM as dedicated hardware to safeguard the CMK.
	Alias	The identifier of the CMK. For more information, see Use aliases in *KMS User Guide*.
	Description	The description of the CMK.

Section	Parameter	Description
Advanced Settings	Rotation Period	Specifies whether to enable automatic rotation. If you choose to enable automatic rotation, you must select a rotation period. For more information about rotation, see Key rotation in *KMS User Guide*. Valid values: ○ 30 Days ○ 90 Days ○ 180 Days ○ 365 Days ○ Custom: Customize a period that ranges from 7 to 730 days. **Note** You can specify this parameter only if Key Type is set to Aliyun_AES_256 or Aliyun_SM4.
	Key Material Source	The source of key material. ○ Key Management Service: Use KMS to generate key material. ○ External: Manually import external key material. **Note** If **Rotation Period** is set to **Enable**, the **External** option is unavailable.

7. Click **Submit**.
8. Create an ApsaraDB RDS instance with disk encryption enabled. For more information, see Create an ApsaraDB RDS for PostgreSQL instance that uses standard or enhanced SSDs.

11.1.12. Logs and audit

11.1.12.1. Configure SQL audit

This topic describes how to configure the SQL audit feature to audit SQL executions and check the details. SQL audit does not affect instance performance.

Precautions

- SQL audit does not affect instance performance.
- SQL audit logs are retained for 30 days.
- Log files exported from SQL audit are retained for two days. The system deletes files that are retained for longer than two days.
- SQL audit is disabled by default. You must manually enable it.
- You cannot view logs that are generated before SQL audit is enabled.

Enable SQL audit

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab.

6. Click **Enable SQL Audit** or **Enable now**.
7. In the message that appears, click **Confirm**.

> **Note** After SQL audit is enabled, you can query SQL information based on conditions such as the time, database, user, and keyword.

Disable SQL audit

You can disable SQL audit when it is no longer needed. To disable SQL audit, perform the following steps:

> **Notice** After SQL audit is disabled, all SQL audit logs are deleted. We recommend that you export and store audit logs to your computer before you disable SQL audit.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Data Security**.
5. Click the **SQL Audit** tab. Click **Export File**.

> **Note** If more than 1 million SQL audit logs meet the filter conditions you specify, only 1 million logs can be exported. SQL audit logs are exported at a speed of 900 entries per second. It takes about 20 minutes to export 1 million SQL audit logs.

6. Click **Files**. Find a file and click Download in the **Action** column to download the file to your computer.
7. Click **Disable SQL Audit**.
8. In the message that appears, click **Confirm**.

11.1.12.2. Manage logs

You can view logs for errors, slow queries, and primary/secondary instance switching for ApsaraDB RDS for PostgreSQL instances in the ApsaraDB RDS console or by executing SQL statements. These logs help you troubleshoot errors. This topic describes how to manage logs in the console.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Logs**.
5. On the **Logs** page, click the **Error Logs**, **Slow Query Logs**, or **Primary/Secondary Switching Logs** tab, select a time range, and then click **Search**.

Tab	Description
Error Logs	Records database running errors that occurred within the last month.
Slow Query Logs	Records SQL statements within the last month that took longer than one second to execute. Duplicated SQL statements are removed.

Tab	Description
Primary/Secondary Switching Logs	Records switchovers between the primary and secondary instances within the last month.

11.1.13. Backup

11.1.13.1. Back up an ApsaraDB RDS for PostgreSQL instance

This topic describes how to back up an ApsaraDB RDS for PostgreSQL instance. You can configure a backup policy that is used to automatically back up your ApsaraDB RDS instance. If you do not configure a backup policy, the default backup policy is used. You can also manually back up your ApsaraDB RDS instance.

Precautions

- Do not execute data definition language (DDL) statements during a backup. These statements trigger locks on tables, and the backup may fail as a result of the locks.
- We recommend that you back up your ApsaraDB RDS instance during off-peak hours.
- If your ApsaraDB RDS instance has a large amount of data, a backup may require a long period of time.
- Backup files are retained for a specific retention period. Before the specific retention period elapses, we recommend that you download the required backup files to your computer.

Backup description

ApsaraDB RDS for PostgreSQL allows you to perform full physical backup and back up archived redo log files of databases.

Configure a backup policy for automatic backups

ApsaraDB RDS can automatically back up your instance based on the backup policy that you specify.

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. On the **Backup and Restoration** page, click the **Backup Settings** tab and click **Edit**.
6. In the dialog box that appears, configure the following parameters and click **OK**. The following table lists the parameters.

Parameter	Description
Data Retention Period	The number of days for which you want to retain data backup files. Valid values: 7 to 730. Unit: days. Default value: 7.
Backup Cycle	The cycle to create backups. You can select one or more days of the week. **Note** To ensure data security, we recommend that you back up your ApsaraDB RDS instance at least twice a week.
Backup Time	The period of time for which you want to back up data. Unit: hours.

Parameter	Description
Log Backup	Specifies whether to enable the log backup feature. **Notice** If you disable this feature, all log backup files are deleted and your instance cannot be restored to previous points in time.
Log Retention Period	○ The period of time for which you want to retain log backup files. Valid values: 7 to 730. Unit: days. Default value: 7. ○ The log retention period must be less than or equal to the data retention period.
OSS Dump Status	Specifies whether to enable Object Storage Service (OSS) dump. When OSS dump is enabled, new backup files are automatically dumped to a specific OSS bucket. Valid values: ○ Enabled ○ Disabled
OSS Dumped Data	The type of backup files that are dumped to an OSS bucket. You can select multiple values. Valid values: ○ Data Backup ○ Log Backup
OSS Bucket	The OSS bucket to which you want to dump backup files.

Manually back up your ApsaraDB RDS instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the upper-right corner of the page, click **Back Up Instance**. The **Back Up Instance** dialog box appears.
5. Select the backup mode and backup policy, and click **OK**.

Note The backup mode is **Full Backup** and the backup policy is **Instance Backup**.

What's next

You can click the icon in the upper-right corner of the page to view the task progress displayed in the **Task Progress** list.

11.1.13.2. Download data and log backup files

This topic describes how to download unencrypted data and log backup files in the ApsaraDB RDS console to archive the files and restore data to an on-premises database.

Procedure

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.

4. In the left-side navigation pane, click **Backup and Restoration** to go to the **Backup and Restoration** page.
5. Click the Data Backup or Archived Logs tab.
   - To download data backup files, click the **Data Backup** tab.
   - To download log files, click the **Archived Logs** tab.
6. Select a time range to which you want to restore the instance.
7. Find the data backup or log file that you want to download and click **Download** in the **Actions** column.

> **Note**
> - If you want to use a data backup file to restore data, select the backup file that is the closest to the time for restoration.
> - If you want to use a log file to restore data to an on-premises database, take note of the following items:
>   - The instance No. of the log file must be the same as that of the data backup file.
>   - The start time of the log file must be later than the data backup time and earlier than the time for restoration.

8. In the message that appears, select a download method.

Download method	Description
Download	Download the file by using the public endpoint.
Copy Internal Endpoint	Copy the internal endpoint to download the file. If your ECS and ApsaraDB RDS instances are deployed within the same region, you can log on to the ECS instance and use the internal endpoint to download the file. This method is fast and secure.
Copy Public Endpoint	Copy the public endpoint to download the file. If you want to use other tools to download the file, use the public endpoint.

> **Note** If you use a Linux operating system, you can run the following command to download the file:
>
> ```
> wget -c '<Public endpoint of the backup file, which is the download URL>' -O <File name>
> ```
>
> - The -c option enables resumable download.
> - The -O option saves the downloaded file by using a specified name. We recommend that you use the file name contained in the download URL.
> - If the URL contains more than one parameter, enclose the download URL in a pair of single quotation marks (').

11.1.13.3. Create a logical backup for an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use pg_dump to create a logical backup for an ApsaraDB RDS for PostgreSQL instance and export the backup file to your computer.

Context

The pg_dump utility provided with PostgreSQL is used to back up individual databases. For more information, visit pg_dump.

In this example, an ApsaraDB RDS for PostgreSQL instance that runs Linux 7 and PostgreSQL 10 is used.

Prerequisites

- The IP address of your ECS instance or host is added to a whitelist of the ApsaraDB RDS for PostgreSQL instance. For more information, see Configure an IP address whitelist.
- Your ECS instance or host runs the same version of PostgreSQL as the ApsaraDB RDS for PostgreSQL instance.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Back up a database

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance:

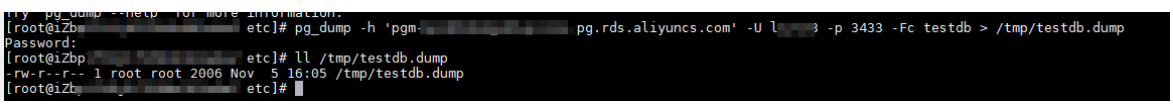
```
pg_dump -h '<hostname>' -U <username> -p <port> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -Fc testdb > /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.



Back up one or more tables

1. Log on to your ECS instance or host. Then, run the following command to back up one or more tables from a database in the ApsaraDB RDS for PostgreSQL instance:

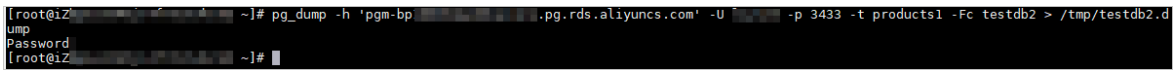
```
pg_dump -h '<hostname>' -U <username> -p <port> -t <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table that you want to back up. You can use `-t <table>` to specify more than one table.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -t products1 -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.



Back up a database with one or more tables excluded

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS instance with one or more tables excluded:

```
pg_dump -h '<hostname>' -U <username> -p <port> -T <table> -Fc <dbname> > <dumpdir>
```

Parameter	Description

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
table	The name of the table that you want to exclude. You can use `-T <table>` to specify more than one table.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -T products1 -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

Back up the schema of a database with data excluded

1. Log on to your ECS instance or host. Then, run the following command to back up the schema of a database from the ApsaraDB RDS for PostgreSQL instance:

```
pg_dump -h '<hostname>' -U <username> -p <port> -s -Fc <dbname> > <dumpdir>
```

Parameter	Description

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances use the VPC network type, make sure that both instances are deployed within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
-s	Specifies whether to back up only the schema of the database. The data of the database is not backed up. For more information, visit pg_dump.
-Fc	The output file format. `-Fc` specifies the custom format, which is ideal when you use pg_restore to import logical backup files and restore databases. For more information, visit pg_dump.
dbname	The name of the database that you want to back up.
dumpdir	The directory and name of the logical backup file to export.

Example:

```
pg_dump -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -s -Fc testdb2 > /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

11.1.13.4. Create a full backup of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the pg_basebackup utility provided by open source PostgreSQL to create a full backup of your ApsaraDB RDS for PostgreSQL instance and export the backup files to your computer.

Prerequisites

- The IP address of your ECS instance or host is added to a whitelist of your ApsaraDB RDS for PostgreSQL instance. For more information, see Configure an IP address whitelist.

- Your ECS instance or host runs the same version of PostgreSQL as the ApsaraDB RDS for PostgreSQL instance.

Context

pg_basebackup backs up all data of a PostgreSQL instance. Backup files can be used for point-in-time recovery. For more information, visit pg_basebackup.

In this example, CentOS 7 is used to create a full backup.

Precautions

We recommend that you use the privileged account of the ApsaraDB RDS for PostgreSQL instance to ensure that you have all the required permissions.

Procedure

> **Note** pg_basebackup cannot back up a single database or database object. For more information about how to back up a single database or database object, see Create a logical backup for an ApsaraDB RDS for PostgreSQL instance.

1. Log on to your ECS instance or host. Then, run the following command to back up a database from the ApsaraDB RDS for PostgreSQL instance:

   ```
   pg_basebackup -Ft -Pv -Xf -z -D <backupdir> -Z5 -h '<hostname>' -p <port> -U <username> -W
   ```

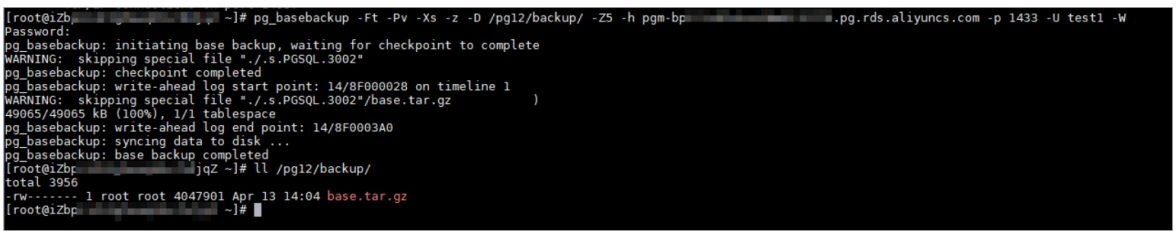
   The following table describes the parameters in this command. For more information, visit pg_basebackup.

Parameter	Description
backupdir	The directory of backup files that are exported. The system automatically creates this directory. However, if this directory already exists and is not empty, the system reports an error.
hostname	The internal endpoint of the ApsaraDB RDS for PostgreSQL instance. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
username	A username of the ApsaraDB RDS for PostgreSQL instance.

   Example:

   ```
   pg_basebackup -Ft -Pv -Xf -z -D /pg12/backup1/ -Z5 -h pgm-bpxxxxx.pg.rds.aliyuncs.com -p 1433 -U test1 -W
   ```

2. When `Password:` appears, enter the password of the username of the ApsaraDB RDS for PostgreSQL instance and press the Enter key.

11.1.14. Restoration

11.1.14.1. Restore data of an ApsaraDB RDS for PostgreSQL instance

This topic describes how to use the backup data of an ApsaraDB RDS for PostgreSQL instance to restore data.

Precautions

- The new instance must have the same whitelist, backup, and parameter settings as the original instance.
- The new instance must have the same data and account information as the backup set or instance at the time point.

Prerequisites

The original instance must meet the following requirements:

- The original instance is in the Running state and is not locked.
- The original instance does not have ongoing migration tasks.
- If you want to restore data to a point in time, the log backup feature is enabled for the original instance.
- If you want to restore an instance from a backup set, the original instance has at least one backup set.

Restore data of an ApsaraDB RDS for PostgreSQL instance

1. Log on to the ApsaraDB RDS console.
2. On the **Instances** page, find the target instance.
3. Click the instance ID or click **Manage** in the Actions column corresponding to the instance to go to the **Basic Information** page.
4. In the left-side navigation pane, click **Backup and Restoration**.
5. In the upper-right corner of the page, click **Restore Database (Previously Clone Database)**.
6. Configure the following parameters.

Section	Parameter	Description
Region	**Region**	The region where the instance is deployed.
Restore Database	**Restore Mode**	◦ **By Time**: You can restore data to a point in time within the retention period of the log backup. For more information about how to view or change the retention period of log backups, see Back up an ApsaraDB RDS for PostgreSQL instance. ◦ **By Backup Set** **Note** The **By Time** option appears only when the log backup feature is enabled.
	Restore Time	The time to which the database is restored. This parameter is displayed when you set **Restore Mode** to **By Time**.
	Backup Set	The backup set used to restore the database. This parameter is displayed when you set **Restore Mode** to **By Backup Set**.
	Instance Name	The name of the instance.

Section	Parameter	Description
Specifications	**Database Engine**	The engine of the database. The value of this parameter is set to **PostgreSQL** and cannot be changed.
	Engine Version	The version of the database engine. The value of this parameter is set to the engine version of the current instance and cannot be changed.
	Edition	The edition of the instance.
	Storage Type	The storage type of the instance. The value of this parameter is set to the storage type of the current instance and cannot be changed.
	Instance Type	The instance type of the instance. Memory size determines the maximum number of connections and IOPS. The actual values are displayed in the console. For more information, see Instance types in *Instance types* of *ApsaraDB RDS Product Introduction*.
	Storage Capacity	The storage capacity of the instance, including the space to store data, system files, binlog files, and transaction files. Valid values: 20 to 600. Unit: GB. The value must be in 1 GB increments.
Network Type	**Network Type**	The network type of the instance. ApsaraDB RDS instances support the following network types: ○ **Classic Network**: Cloud services on a classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or whitelist policy of the service. ○ **VPC**: A virtual private cloud (VPC) helps you build an isolated network environment on Apsara Stack. You can customize route tables, CIDR blocks, and gateways in a VPC. We recommend that you select VPC for improved security. **Note** If you set the network type to **VPC**, you must also select a **VPC** and a **vSwitch**.

7. Click **Submit**.

11.1.14.2. Restore data from a logical backup file

This topic describes how to restore data from a logical backup file to an ApsaraDB RDS for PostgreSQL instance or an on-premises PostgreSQL database.

Context

A logical backup file is used to restore a small amount of data, such as data in a table. For a large amount of data, we recommend that you restore it from a full physical backup file to a new ApsaraDB RDS instance and then use Data Transmission Service (DTS) to migrate data to the original ApsaraDB RDS instance.

Prerequisites

Data in the ApsaraDB RDS for PostgreSQL instance is logically backed up. For more information, see Create a logical backup for an ApsaraDB RDS for PostgreSQL instance.

Precautions

- We recommend that you do not restore data to the default postgres database.
- When you restore the data of a table, the system does not restore the database objects on which the table depends. The restoration may fail.

Restore the data of a database

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> <dumpdir>
```

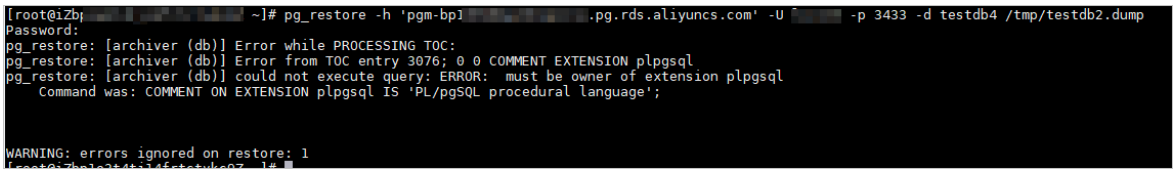
Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

Note You can ignore alerts generated by the embedded plpgsql plug-in.



Restore the data of a table

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore the data of a table:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -t <table> -c <dumpdir>
```

Parameter	Description

Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose data you want to restore.
table	The name of the table whose data you want to restore.
-c	`-c`: specifies to delete the database objects on which the table depends before data restoration. For more information, visit pg_restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb2 -t products -c /tmp/testdb.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

Restore the schema of a database with data excluded

1. Log on to the ECS instance or on-premises host that houses the logical backup file and run the following command to restore only the schema of a database:

```
pg_restore -h '<hostname>' -U <username> -p <port> -d <dbname> -s <dumpdir>
```

Parameter	Description

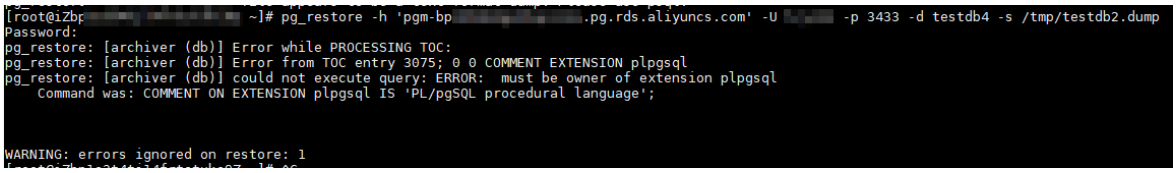
Parameter	Description
hostname	The endpoint of the ApsaraDB RDS for PostgreSQL instance. **Note** If your ECS instance connects to the ApsaraDB RDS for PostgreSQL instance by using an internal endpoint, make sure that the ECS and ApsaraDB RDS instances have the same network type. If both instances are of the VPC network type, make sure that both instances reside within the same VPC. For more information about how to view the internal endpoint, see View and modify the internal endpoint and port number.
username	The username of the privileged account of the ApsaraDB RDS for PostgreSQL instance.
port	The port number of the ApsaraDB RDS for PostgreSQL instance.
dbname	The name of the database whose schema you want to restore.
-s	`-s` : specifies to restore only the schema of the database. The data of the database is not restored. For more information, visit pg_restore.
dumpdir	The directory and name of the logical backup file to use.

Example:

```
pg_restore -h 'pgm-bpxxxxx.pg.rds.aliyuncs.com' -U test123 -p 3433 -d testdb4 -s /tmp/testdb2.dump
```

2. When `Password:` appears, enter the password of the privileged account of your ApsaraDB RDS instance and press the Enter key.

Note You can ignore alerts generated by the embedded plpgsql plug-in.



11.1.15. CloudDBA

11.1.15.1. Introduction to CloudDBA

CloudDBA is a cloud service for database self-detection, self-repair, self-optimization, self-maintenance, and self-security based on machine learning and expertise. CloudDBA helps you ensure stable, secure, and efficient databases without worrying about the management complexity and service failures caused by manual operations.

Features

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the following features:

- Diagnostics

  You can diagnose your instance and view the visualized diagnostic results.

- Instance sessions

  You can view sessions, check session statistics, analyze SQL statements, and optimize the execution of SQL statements.

- Real-time monitoring

  You can view the real-time information of your instance, such as the queries per second (QPS), transactions per second (TPS), number of connections, and network traffic.

- Storage analysis

  You can view the storage overview, trends, exceptions, tablespaces, and data spaces.

- Dashboard

  You can view and compare performance trends, customize monitoring dashboards, check exceptions, and view instance topologies.

- Slow query logs

  You can view the trends and statistics of slow queries.

11.1.15.2. Diagnostics

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the diagnostics feature. This feature diagnoses your ApsaraDB RDS for PostgreSQL instance and visualizes the results.

Navigate to the Diagnostics tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Diagnostics** tab.

> **Note** For more information, see Diagnostics in *Database Autonomy Service User Guide*.

11.1.15.3. Session management

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the session management feature. This feature allows you to view and manage the sessions of an instance.

Navigate to the Session Management tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Session Management** tab.

> **Note** For more information, see Instance sessions in *Database Autonomy Service User Guide*.

11.1.15.4. Real-time monitoring

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the real-time monitoring feature. This feature allows you to view the real-time performance of your ApsaraDB RDS for PostgreSQL instance.

Navigate to the Real-time Monitoring tab

1. Log on to the ApsaraDB for RDS console.

2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Real-time Monitoring** tab.

> **Note** For more information, see Real-time monitoring in *Database Autonomy Service User Guide*.

11.1.15.5. Storage analysis

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the storage analysis feature. This feature allows you to check and solve storage exceptions in a timely manner to ensure database stability.

Context

You can use the storage analysis feature of CloudDBA to view the disk space usage of your ApsaraDB RDS for PostgreSQL instance and the number of remaining days when disk space is available. It also provides information about the space usage, fragmentation, and exception diagnostic results of a table.

Navigate to the Storage Analysis tab

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Diagnostics**.
4. Click the **Storage Analysis** tab.

> **Note** For more information, see Storage analysis in *Database Autonomy Service User Guide*.

11.1.15.6. Dashboard

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the dashboard feature. This feature allows you to view performance trends in specific ranges, compare performance trends, and customize charts to view performance trends.

Navigate to the Dashboard page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Dashboard**.

> **Note** For more information, see Dashboard in *Database Autonomy Service User Guide*.

11.1.15.7. Slow query logs

In ApsaraDB RDS for PostgreSQL, CloudDBA provides the slow query logs feature. This feature allows you to view the trends and execution details of slow queries and obtain optimization suggestions for your ApsaraDB RDS for PostgreSQL instance.

Navigate to the Slow Query Logs page

1. Log on to the ApsaraDB for RDS console.
2. On the **Instances** page, find the target instance.
3. In the left-side navigation pane, choose **CloudDBA > Slow Query Logs**.

> **Note** For more information, see Slow query logs in *Database Autonomy Service User Guide*.

11.1.16. Plug-ins

11.1.16.1. Plug-ins supported

This topic describes the plug-ins that are supported by ApsaraDB RDS for PostgreSQL and their available versions.

PostgreSQL 12

Plug-in	Version
btree_gin	1.3
btree_gist	1.5
citext	1.6
cube	1.4
dblink	1.2
dict_int	1
earthdistance	1.1
fuzzystrmatch	1.1
hstore	1.6
intagg	1.1
intarray	1.2
isn	1.2
ltree	1.1
pg_buffercache	1.3
pg_prewarm	1.2
pg_stat_statements	1.7
pg_trgm	1.4
pgcrypto	1.3
pgrowlocks	1.2
pgstattuple	1.5
postgres_fdw	1
sslinfo	1.2
tablefunc	1

Plug-in	Version
unaccent	1.1
plpgsql	1
plperl	1
pg_roaringbitmap	0.5.0
rdkit	3.8
mysql_fdw	1.1
ganos_geometry_sfcgal	3.0
ganos_geometry_topology	3.0
ganos_geometry	3.0
ganos_networking	3.0
ganos_pointcloud_geometry	3.0
ganos_pointcloud	3.0
ganos_raster	3.0
ganos_spatialref	3.0
ganos_trajectory	3.0
ganos_tiger_geocoder	3.0
ganos_address_standardizer	3.0
ganos_address_standardizer_data_us	3.0
wal2json	2.0
hll	2.14
plproxy	2.9.0
tsm_system_rows	1.0
tsm_system_time	1.0
smlar	1.0
tds_fdw	1.0
bigm	1.2
timescaledb	1.7.1

PostgreSQL 11

Plug-in	Version
plpgsql	1
pg_stat_statements	1.6
btree_gin	1.3
btree_gist	1.5
citext	1.5
cube	1.4
rum	1.3
dblink	1.2
dict_int	1
earthdistance	1.1
hstore	1.5
intagg	1.1
intarray	1.2

11.1.16.2. Use mysql_fdw to read data from and write data to a MySQL database

This topic describes how to use the mysql_fdw plug-in of ApsaraDB RDS for PostgreSQL to read data from and write data to a database on an ApsaraDB RDS for MySQL instance or a self-managed MySQL database.

Prerequisites

- The instance runs PostgreSQL 10.
- Communication between your ApsaraDB RDS for PostgreSQL instance and the MySQL database is normal.

Context

PostgreSQL 9.6 and later support parallel computing. PostgreSQL 11 can use joins on up to a billion data records to complete queries in seconds. A number of users prefer to use PostgreSQL to build small-sized data warehouses and process highly concurrent access requests. PostgreSQL 13 is under development. It will support columnar storage engines that further improve analysis capabilities.

The mysql_fdw plug-in establishes a connection to synchronize data from a MySQL database to your ApsaraDB RDS for PostgreSQL instance.

Procedure

1. Log on to a database of your ApsaraDB RDS for PostgreSQL instance. For more information, see Connect to an ApsaraDB RDS for PostgreSQL instance.
2. Create the mysql_fdw plug-in.

   ```
   create extension mysql_fdw;
   ```

3. Define a MySQL server.

   ```
   CREATE SERVER <Name of the MySQL server>
   FOREIGN DATA WRAPPER mysql_fdw
   OPTIONS (host '<Endpoint used to connect to the MySQL server>', port '<Port used to connect to the
   MySQL server>');
   ```

   Example:

   ```
   CREATE SERVER mysql_server
   FOREIGN DATA WRAPPER mysql_fdw
   OPTIONS (host 'rm-xxx.mysql.rds.aliyuncs.com', port '3306');
   ```

4. Map the MySQL server to an account created on your ApsaraDB RDS for PostgreSQL instance. Then, the account can be used to access data in the MySQL database on the MySQL server.

   ```
   CREATE USER MAPPING FOR <Username of the account to which the MySQL server is mapped>
   SERVER <Name of the MySQL server>
   OPTIONS (username '<Username used to log on to the MySQL database>', password '<Password used to l
   og on to the MySQL database>');
   ```

   Example:

```
CREATE USER MAPPING FOR pgtest
SERVER mysql_server
OPTIONS (username 'mysqltest', password 'Test1234!') ;
```

5. Create a foreign MySQL table by using the account that you mapped to the MySQL server in the previous step.

> **Note** The field names in the foreign MySQL table must be the same as those in the table of the MySQL database. You can choose to create only the fields you want to query. For example, if the table in the MySQL database contains the ID, NAME, and AGE fields, you can create only the ID and NAME fields in the foreign MySQL table.

```
CREATE FOREIGN TABLE <Name of the foreign MySQL table> (<Name of Field 1> <Data type of Field 1>,<Name of Field 2> <Data type of Field 2>...) server <Name of the MySQL server> options (dbname '<Name of the MySQL database>', table_name '<Name of the table in the MySQL database>');
```

Example:

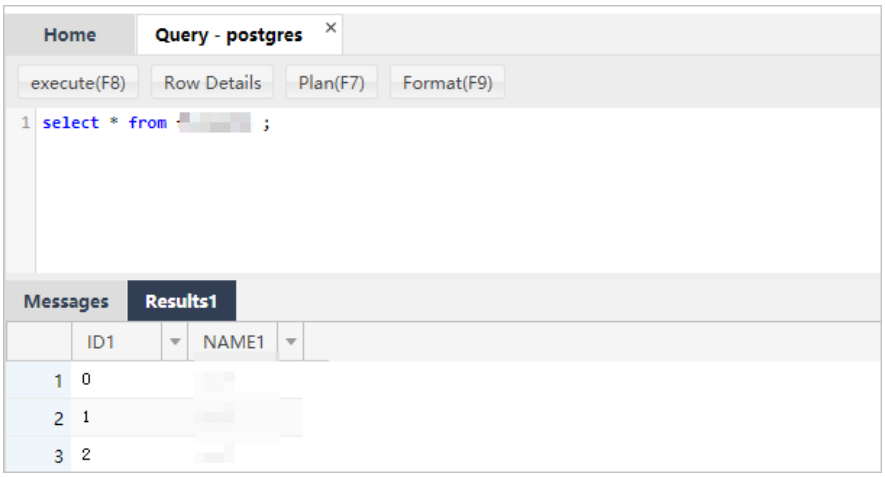
```
CREATE FOREIGN TABLE ft_test (id1 int, name1 text) server mysql_server options (dbname 'test123', table_name 'test');
```

What to do next

You can use the foreign MySQL table to test the performance of read and write operations on the MySQL database.

> **Note** Data can be written to the table in the MySQL database only when the table is assigned a primary key. If the table is not assigned a primary key, the following error is reported:
>
> ```
> ERROR:  first column of remote table must be unique for INSERT/UPDATE/DELETE operation.
> ```

```
select * from ft_test ;
insert into ft_test values (2,'abc');
insert into ft_test select generate_series(3,100),'abc';
select count(*) from ft_test ;
```



Run `postgres=> explain verbose select count(*) from ft_test;` to find out how the requests sent from your ApsaraDB RDS for PostgreSQL instance are executed to query data from the MySQL database. Command output:

```
                                QUERY PLAN
-------------------------------------------------------------------------------
 Aggregate  (cost=1027.50..1027.51 rows=1 width=8)
   Output: count(*)
   ->  Foreign Scan on public.ft_test  (cost=25.00..1025.00 rows=1000 width=0)
         Output: id, info
         Remote server startup cost: 25
         Remote query: SELECT NULL FROM `test123`.`test`
(6 rows)
```

11.1.16.3. Use oss_fdw to read and write foreign data files

This topic describes how to use the oss_fdw plug-in to load data between Object Storage Service (OSS) and PostgreSQL or PPAS databases.

oss_fdw parameters

The oss_fdw plug-in uses a method similar to other Foreign Data Wrapper (FDW) interfaces to encapsulate foreign data stored in OSS. You can use oss_fdw to read data stored in OSS. This process is similar to reading data tables. oss_fdw provides unique parameters to connect and parse file data in OSS.

> **Note**
>
> - oss_fdw can read and write files of the following types in OSS: TXT and CSV files as well as GZIP-compressed TXT and CSV files.
> - The value of each parameter must be enclosed in double quotation marks (") and cannot contain unnecessary spaces.

CREATE SERVER parameters

- ossendpoint: the endpoint used to access OSS over the internal network, also known as the host.
- id oss: the AccessKey ID of the OSS account.
- key oss: the AccessKey secret of the OSS account.
- bucket: the bucket where the data you want to access is stored. You must create an OSS account before you specify this parameter.

The following fault tolerance parameters can be used for data import and export. If network connectivity is poor, you can adjust these parameters to ensure successful import and export.

- oss_connect_timeout: the connection timeout period. Default value: 10. Unit: seconds.
- oss_dns_cache_timeout: the DNS timeout period. Default value: 60. Unit: seconds.
- oss_speed_limit: the minimum data transmission rate. Default value: 1024. Unit: bytes/s.
- oss_speed_time: the maximum waiting period during which the data transmission rate is lower than the minimum value. Default value: 15. Unit: seconds.

If the default values of oss_speed_limit and oss_speed_time are used, a timeout error occurs when the transmission rate is lower than 1,024 bytes/s for 15 consecutive seconds.

CREATE FOREIGN TABLE parameters

- filepath: a file name that contains a path in OSS.
  - The file name specified by this parameter contains the directory name but not the bucket name.
  - This parameter matches multiple files in the corresponding path in OSS. You can load multiple files to a database.

  - You can import files that adhere to the filepath or filepath.x format to a database. The values of x must be consecutive numbers starting from 1.

    For example, among the files named filepath, filepath.1, filepath.2, filepath.3, and filepath.5, the first four files are matched and imported. The filepath.5 file is not imported.

- dir: the virtual file directory in OSS.
  - The specified directory must end with a forward slash (/).
  - All files (excluding subfolders and files in subfolders) in the virtual file directory specified by dir are matched and imported to a database.
- prefix: the prefix of the path name corresponding to the data file. The prefix does not support regular expressions. The prefix, filepath, and dir parameters are mutually exclusive. Therefore, only one of them can be specified at a time.
- format: the file format, which can only be CSV.
- encoding: the file data encoding format. It supports common PostgreSQL encoding formats, such as UTF-8.
- parse_errors: the fault-tolerant parsing mode. If an error occurs during the parsing process, the entire row of data is ignored.
- delimiter: the string used to delimit columns.
- quote: the quote character for files.
- escape: the escape character for files.
- null: sets the column matching the specified string to null. For example, null 'test' is used to set the value of the 'test' column to null.
- force_not_null: sets the value of a column to a non-null value. For example, force_not_null 'id' is used to set the value of the 'id' column to empty strings.
- compressiontype: the format of the files to be read or written in OSS.
  - none: The files are uncompressed. This is the default value.
  - gzip: The files are compressed in the GZIP format.
- compressionlevel: the degree to which data files written to OSS are compressed. Valid values: 1 to 9. Default value: 6.

> **Note**
> - You must specify filepath and dir in the OPTIONS parameter.
> - You must specify filepath or dir.
> - The export mode can only be dir.

Export mode parameters for CREATE FOREIGN TABLE

- oss_flush_block_size: the buffer size for the data written to OSS at a time. Default value: 32. Valid values: 1 to 128. Unit: MB.
- oss_file_max_size: the maximum size of a data file allowed to be written to OSS. If a data file reaches the maximum size, the remaining data is written to another data file. Default value: 1024. Valid values: 8 to 4000. Unit: MB.
- num_parallel_worker: the maximum number of threads that are allowed to run in parallel to compress the data written to OSS. Valid values: 1 to 8. Default value: 3.

Auxiliary functions

FUNCTION oss_fdw_list_file (relname text, schema text DEFAULT 'public')

- This function obtains the name and size of the OSS file that a foreign table matches.
- The file size is measured in bytes.

The following result is returned after `select * from oss_fdw_list_file('t_oss');` is executed:

```
              name              |   size
--------------------------------+-----------
 oss_test/test.gz.1  | 739698350
 oss_test/test.gz.2  | 739413041
 oss_test/test.gz.3  | 739562048
(3 rows)
```

Auxiliary features

oss_fdw.rds_read_one_file: In read mode, this feature is used to specify a file to match the foreign table. The foreign table matches only the specified file during data import.

Example: set oss_fdw.rds_read_one_file = 'oss_test/example16.csv.1';

The following result is returned after `set oss_fdw.rds_read_one_file = 'oss_test/test.gz.2';` and `select * from oss_fdw_list_file('t_oss');` are executed:

```
              name              |   size
--------------------------------+-----------
  oss_test/test.gz.2  | 739413041
(1 rows)
```

oss_fdw example

```
# Create the plug-in for a PostgreSQL database.
create extension oss_fdw; -- For a PPAS database, execute select rds_manage_extension('create','oss_fdw');
# Create a server.
CREATE SERVER ossserver FOREIGN DATA WRAPPER oss_fdw OPTIONS
     (host 'oss-cn-hangzhou.aliyuncs.com', id 'xxx', key 'xxx', bucket 'mybucket');
# Create an OSS foreign table.
CREATE FOREIGN TABLE ossexample
    (date text, time text, open float,
     high float, low float, volume int)
     SERVER ossserver
     OPTIONS ( filepath 'osstest/example.csv', delimiter ',' ,
         format 'csv', encoding 'utf8', PARSE_ERRORS '100');
# Create a table named example to which to import data.
create table example
        (date text, time text, open float,
         high float, low float, volume int);
# Load data from ossexample to example.
insert into example select * from ossexample;
# Result
# oss_fdw estimates the file size in OSS and formulates a query plan.
explain insert into example select * from ossexample;
                            QUERY PLAN
------------------------------------------------------------------------
 Insert on example  (cost=0.00..1.60 rows=6 width=92)
   ->  Foreign Scan on ossexample  (cost=0.00..1.60 rows=6 width=92)
         Foreign OssFile: osstest/example.csv.0
         Foreign OssFile Size: 728
(4 rows)
# Write the data in the example table to OSS.
insert into ossexample select * from example;
explain insert into ossexample select * from example;
                           QUERY PLAN
-----------------------------------------------------------------
 Insert on ossexample  (cost=0.00..16.60 rows=660 width=92)
   ->  Seq Scan on example  (cost=0.00..16.60 rows=660 width=92)
(2 rows)
```

Additional considerations

- oss_fdw is a foreign table plug-in developed based on the PostgreSQL FOREIGN TABLE framework.
- The data import performance varies based on the PostgreSQL cluster resources (CPU, I/O, and memory) and OSS.
- To ensure data import performance, the ApsaraDB RDS for PostgreSQL instance must be in the same region as the OSS bucket.

ID and key encryption

If the id and key parameters for CREATE SERVER are not encrypted, the `select * from pg_foreign_server` statement execution result displays the information. Your AccessKey ID and AccessKey secret are exposed. You can use symmetric encryption to hide your AccessKey ID and AccessKey secret. Use different AccessKey pairs for different instances to further protect your information. However, to avoid incompatibility with earlier versions, do not add data types as you would in Greenplum.

Encrypted information:

```
postgres=# select * from pg_foreign_server ;
  srvname  | srvowner | srvfdw | srvtype | srvversion | srvacl |
srvoptions
-----------+----------+--------+---------+------------+--------+-----------------------------------
-----------------------------------------------------------------------------------------------
---------------------------------
 ossserver |       10 |  16390 |         |            |        | {host=oss-cn-hangzhou-zmf.aliyuncs.co
m,id=MD5xxxxxxxx,key=MD5xxxxxxxx,bucket=067862}
```

The encrypted information is preceded by the MD5 hash value. The remainder of the total length divided by 8 is 3. Therefore, encryption is not performed again when the exported data is imported. You cannot create an AccessKey pair that is preceded by MD5.

11.1.17. Use Pgpool for read/write splitting in ApsaraDB RDS for PostgreSQL

This topic describes how to use the Pgpool tool of PostgreSQL installed on an ECS instance to implement read/write splitting for your primary and read-only ApsaraDB RDS for PostgreSQL instances.

Context

If you do not use Pgpool to ensure high availability, Pgpool is stateless. The decrease in performance can be ignored. Additionally, Pgpool supports horizontal scaling of your database system. You can use Pgpool and the high availability architecture of ApsaraDB RDS for PostgreSQL to implement read/write splitting.

Set up a test environment

If you have purchased a primary ApsaraDB RDS instance that runs PostgreSQL 10 and have attached read-only instances to the primary instance, you need only to install Pgpool . For more information, see Create an instance and Create a read-only ApsaraDB RDS for PostgreSQL instance. After you install Pgpool, go to Configure Pgpool.

1. Run the `vi /etc/sysctl.conf` command to open the sysctl.conf file. Modify the following configurations:

```
# add by digoal.zhou
fs.aio-max-nr = 1048576
fs.file-max = 76724600
# Optional. Set the kernel.core_pattern parameter to /data01/corefiles/core_%e_%u_%t_%s.%p.

# The /data01/corefiles directory that is used to store core dumps is created with the 777 permiss
ion before testing. If a symbolic link is used, change the directory to 777.
kernel.sem = 4096 2147483647 2147483646 512000
# Specify the semaphore. You can run the ipcs -l or -u command to obtain the semaphore count. Each
group of 16 processes requires a semaphore with a count of 17.
kernel.shmall = 107374182
# Specify the total size of shared memory segments. Recommended value: 80% of the memory capacity.
Unit: pages.
kernel.shmmax = 274877906944
# Specify the maximum size of a single shared memory segment. Recommended value: 50% of the memory
capacity. Unit: bytes. In PostgreSQL versions later than 9.2, the use of shared memory significant
ly drops.
kernel.shmmni = 819200
# Specify the total number of shared memory segments that can be generated. At least two shared me
mory segments must be generated within each PostgreSQL cluster.
net.core.netdev_max_backlog = 10000
net.core.rmem_default = 262144
# The default setting of the socket receive buffer in bytes.
net.core.rmem_max = 4194304
# The maximum receive socket buffer size in bytes
```

```
net.core.wmem_default = 262144
# The default setting (in bytes) of the socket send buffer.
net.core.wmem_max = 4194304
# The maximum send socket buffer size in bytes.
net.core.somaxconn = 4096
net.ipv4.tcp_max_syn_backlog = 4096
net.ipv4.tcp_keepalive_intvl = 20
net.ipv4.tcp_keepalive_probes = 3
net.ipv4.tcp_keepalive_time = 60
net.ipv4.tcp_mem = 8388608 12582912 16777216
net.ipv4.tcp_fin_timeout = 5
net.ipv4.tcp_synack_retries = 2
net.ipv4.tcp_syncookies = 1
# Enable SYN cookies. If an SYN waiting queue overflows, you can enable SYN cookies to defend agai
nst a small number of SYN attacks.
net.ipv4.tcp_timestamps = 1
# Reduce the time after which a network socket enters the TIME-WAIT state.
net.ipv4.tcp_tw_recycle = 0
# If you set this parameter to 1 to enable the recycle function, network sockets in the TIME-WAIT
state over TCP connections are recycled. However, if network address translation (NAT) is used, TC
P connections may fail. We recommend that you set this parameter to 0 on the database server.
net.ipv4.tcp_tw_reuse = 1
# Enable the reuse function. This function enables network sockets in the TIME-WAIT state to be re
used over new TCP connections.
net.ipv4.tcp_max_tw_buckets = 262144
net.ipv4.tcp_rmem = 8192 87380 16777216
net.ipv4.tcp_wmem = 8192 65536 16777216
net.nf_conntrack_max = 1200000
net.netfilter.nf_conntrack_max = 1200000
vm.dirty_background_bytes = 409600000
# If the size of dirty pages reaches the specified limit, a background scheduling process (for exa
mple, pdflush) is invoked to flush the dirty pages to disks. These are the pages that are generate
d n seconds earlier. The value of n is calculated by using the following formula: n = Value of the
dirty_expire_centisecs parameter/100.
# The default limit is 10% of the memory capacity. If the memory capacity is large, we recommend t
hat you specify the limit in bytes.
vm.dirty_expire_centisecs = 3000
# Specify the maximum period to retain dirty pages. Dirty pages are flushed to disks after the tim
e period specified by this parameter elapses. The value 3000 indicates 30 seconds.
vm.dirty_ratio = 95
# The processes that users call to write data onto disks must actively flush dirty pages to disks.
This applies when the background scheduling process to flush dirty pages is slow and the size of d
irty pages exceeds 95% of the memory capacity. These processes include fsync and fdatasync.

# Set this parameter properly to prevent user-called processes from flushing dirty pages to disks.
This allows you to create multiple ApsaraDB RDS instances on a single server and use control group
s to limit the input/output operations per second (IOPS) per instance.
vm.dirty_writeback_centisecs = 100
# Specify the time interval at which the background scheduling process (such as pdflush) flushes d
irty pages to disks. The value 100 indicates 1 second.
vm.swappiness = 0
# Disable the swap function.
vm.mmap_min_addr = 65536
vm.overcommit_memory = 0
# Specify whether you can allocate more memory space than the physical host has available. If you
set this parameter to 1, the system always considers the available memory space sufficient. If the
memory capacity provided in the test environment is low, we recommend that you set this parameter
to 1.
vm.overcommit_ratio = 90
# Specify the memory capacity that can be allocated when the overcommit_memory parameter is set to
```

```
2.
vm.swappiness = 0
# Disable the swap function.
vm.zone_reclaim_mode = 0
# Disable non-uniform memory access (NUMA). You can also disable NUMA in the vmlinux file.

net.ipv4.ip_local_port_range = 40000 65535
# Specify the range of TCP or UDP port numbers for the physical host to allocate.
fs.nr_open=20480000
# Specify the maximum number of file handles that a single process can open.
# Take note of the following parameters:
#vm.extra_free_kbytes = 4096000   # If the physical host provides a low memory capacity, do not sp
ecify a large value such as 4096000. If you specify a large value, the physical host may not start
.
#vm.min_free_kbytes = 6291456    # We recommend that you increase the value of the vm.min_free_kby
tes parameter by 1 GB for every 32 GB of memory.
# If the physical host does not provide much memory, we recommend that you do not configure vm.ext
ra_free_kbytes and vm.min_free_kbytes.
# vm.nr_hugepages = 66536
# If the size of the shared buffer exceeds 64 GB, we recommend that you use huge pages. You can sp
ecify the page size by setting the Hugepagesize parameter in the /proc/meminfo file.

#vm.lowmem_reserve_ratio = 1 1 1
# If the memory capacity exceeds 64 GB, we recommend that you set this parameter. Otherwise, we re
commend that you retain the default value 256 256 32.
```

2. Run the `vi /etc/security/limits.conf` command to open the limits.conf file. Modify the following configurations:

```
* soft    nofile  1024000
* hard    nofile  1024000
* soft    nproc   unlimited
* hard    nproc   unlimited
* soft    core    unlimited
* hard    core    unlimited
* soft    memlock unlimited
* hard    memlock unlimited
# Comment out the other parameters in the limits.conf file.
# Comment out the /etc/security/limits.d/20-nproc.conf file.
```

3. Run the following commands to open the rc.local file:

```
chmod +x /etc/rc.local
vi /etc/rc.local
```

Modify the following configurations to disable transparent huge pages, configure huge pages, and start PostgreSQL:

```
# Disable transparent huge pages.
if test -f /sys/kernel/mm/transparent_hugepage/enabled; then
   echo never > /sys/kernel/mm/transparent_hugepage/enabled
fi
# Configure huge pages for two instances. Each instance has a shared buffer of 16 GB.
sysctl -w vm.nr_hugepages=17000
# Start the two instances.
su - postgres -c "pg_ctl start -D /data01/pg12_3389/pg_root"
su - postgres -c "pg_ctl start -D /data01/pg12_8002/pg_root"
```

4. Create a file system.

> **Warning** If you use a new disk, you must verify that the new disk belongs to the vdb partition instead of the vda partition. If the new disk belongs to the vda partition, data may be deleted from the new disk.

```
parted -a optimal -s /dev/vdb mklabel gpt mkpart primary 1MiB 100%FREE
mkfs.ext4 /dev/vdb1 -m 0 -O extent,uninit_bg -E lazy_itable_init=1 -b 4096 -T largefile -L vdb1
vi /etc/fstab
LABEL=vdb1 /data01 ext4 defaults,noatime,nodiratime,nodelalloc,barrier=0,data=writeback 0 0
mkdir /data01
mount -a
```

5. Start the irqbalance command line tool.

```
systemctl status irqbalance
systemctl enable irqbalance
systemctl start irqbalance
systemctl status irqbalance
```

6. Install PostgreSQL 10 and Pgpool.

```
yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest-7.noarch.rpm
yum install -y https://download.postgresql.org/pub/repos/yum/reporpms/EL-7-x86_64/pgdg-redhat-repo
-latest.noarch.rpm
yum search all postgresql
yum search all pgpool
yum install -y postgresql12*
yum install -y pgpool-II-12-extensions
```

7. Initialize the data directory of your database system.

```
mkdir /data01/pg12_3389
chown postgres:postgres /data01/pg12_3389
```

8. Configure environment variables for the postgres user.

```
su - postgres
vi .bash_profile
```

Append the following parameters to the environment variables:

```
export PS1="$USER@`/bin/hostname -s`-> "
export PGPORT=3389
export PGDATA=/data01/pg12_$PGPORT/pg_root
export LANG=en_US.utf8
export PGHOME=/usr/pgsql-12
export LD_LIBRARY_PATH=$PGHOME/lib:/lib64:/usr/lib64:/usr/local/lib64:/lib:/usr/lib:/usr/local/lib
:$LD_LIBRARY_PATH
export DATE=`date +"%Y%m%d%H%M"`
export PATH=$PGHOME/bin:$PATH:.
export MANPATH=$PGHOME/share/man:$MANPATH
export PGHOST=$PGDATA
export PGUSER=postgres
export PGDATABASE=db1
alias rm='rm -i'
alias ll='ls -lh'
unalias vi
```

9. Initialize your primary ApsaraDB RDS instance.

```
initdb -D $PGDATA -U postgres -E UTF8 --lc-collate=C --lc-ctype=en_US.utf8
```

10. Modify the postgresql.conf file.

```
listen_addresses = '0.0.0.0'
port = 3389
max_connections = 1500
superuser_reserved_connections = 13
unix_socket_directories = '., /var/run/postgresql, /tmp'
tcp_keepalives_idle = 60
tcp_keepalives_interval = 10
tcp_keepalives_count = 10
shared_buffers = 16GB
huge_pages = on
work_mem = 8MB
maintenance_work_mem = 1GB
dynamic_shared_memory_type = posix
vacuum_cost_delay = 0
bgwriter_delay = 10ms
bgwriter_lru_maxpages = 1000
bgwriter_lru_multiplier = 10.0

```

11. Modify the pg_hba.conf file.

> **Note** Pgpool-II is installed on the same ECS instance as the database server where PostgreSQL resides. If you specify the 127.0.0.1 IP address in the pg_hba.conf file, you must enter the correct password to ensure a successful logon.

```
# "local" is for Unix domain socket connections only
local   all             all                                     trust
# IPv4 local connections:
host    all             all             127.0.0.1/32            md5
# IPv6 local connections:
host    all             all             ::1/128                 trust
# Allow replication connections from localhost, by a user with the
# replication privilege.
local   replication     all                                     trust
host    replication     all             127.0.0.1/32            trust
host    replication     all             ::1/128                 trust
host db123 digoal 0.0.0.0/0 md5
```

12. Execute a statement in the database to create a user authorized with streaming replication permissions. Example:

```
create role rep123 login replication encrypted password 'xxxxxxx';
```

13. Execute statements in the database to create a user and authorize it to manage your ApsaraDB RDS instances. Example:

```
create role digoal login encrypted password 'xxxxxxx';
create database db123 owner digoal;
```

14. Create a user who is authorized to check the health heartbeats between Pgpool and your read-only ApsaraDB RDS instances. With the parameters of Pgpool properly configured, this user can check the write-ahead logging (WAL) replay latency on each read-only ApsaraDB RDS instance. Example:

```
create role nobody login encrypted password 'xxxxxxx';
```

Create a secondary ApsaraDB RDS instance

To simplify the test procedure, perform the following steps to create a secondary ApsaraDB RDS instance on the same ECS instance as your primary ApsaraDB RDS instance:

1. Use the pg_basebackup tool to create a secondary ApsaraDB RDS instance.

```
pg_basebackup -D /data01/pg12_8002/pg_root -F p --checkpoint=fast -P -h 127.0.0.1 -p 3389 -U rep12
3
```

2. Run the following commands to open the postgresql.conf file of the secondary ApsaraDB RDS instance:

```
cd /data01/pg12_8002/pg_root
vi postgresql.conf
```

Modify the following configurations:

```
# The secondary ApsaraDB RDS instance has the following configurations different from the primary
ApsaraDB RDS instance:
port = 8002
primary_conninfo = 'hostaddr=127.0.0.1 port=3389 user=rep123' # You do not need to set the passwor
d. This is because trust relationships are configured on the primary ApsaraDB RDS instance.
hot_standby = on
wal_receiver_status_interval = 1s
wal_receiver_timeout = 10s
recovery_target_timeline = 'latest'
```

3. Configure the standby.signal file of the secondary ApsaraDB RDS instance.

```
cd /data01/pg12_8002/pg_root
touch standby.signal
```

4. Execute the `SELECT * FROM pg_stat_replication ;` statement in the database to check whether data is properly synchronized between the primary and secondary ApsaraDB RDS instances. The following output is returned:

```
-[ RECORD 1 ]----+------------------------------
pid              | 21065
usesysid         | 10
usename          | postgres
application_name | walreceiver
client_addr      | 127.0.0.1
client_hostname  |

```

Configure Pgpool

1. Query the location where Pgpool is installed.

```
rpm -qa|grep pgpool
pgpool-II-12-extensions-4.1.1-1.rhel7.x86_64
pgpool-II-12-4.1.1-1.rhel7.x86_64
rpm -ql pgpool-II-12-4.1.1
```

2. Run the following commands to open the pgpool.conf file:

```
cd /etc/pgpool-II-12/
cp pgpool.conf.sample-stream pgpool.conf
vi pgpool.conf
```

Modify the following configurations:

```
listen_addresses = '0.0.0.0'
port = 8001
socket_dir = '/tmp'
reserved_connections = 0
pcp_listen_addresses = ''
pcp_port = 9898
pcp_socket_dir = '/tmp'
# - Backend Connection Settings -

                                    # Database name for health check. If '', tries 'postgres' frist
,
health_check_max_retries = 60
                                    # Maximum number of times to retry a failed health check before
giving up.
health_check_retry_delay = 1
                                    # Amount of time to wait (in seconds) between retries.
connect_timeout = 10000
                                    # Timeout value in milliseconds before giving up to connect to
backend.
                                    # Default is 10000 ms (10 second). Flaky network user may want
to increase
                                    # the value. 0 means no timeout.
                                    # Note that this value is not only used for health check,
                                    # but also for ordinary conection to backend.
#------------------------------------------------------------------------------
# FAILOVER AND FAILBACK
#------------------------------------------------------------------------------
failover_on_backend_error = off
                                    # Initiates failover when reading/writing to the
                                    # backend communication socket fails
                                    # If set to off, pgpool will report an
                                    # error and disconnect the session.
relcache_expire = 0  # After the configuration file is restructured, we recommend that you set thi
s parameter to 1, reload the configuration file, and then set this parameter to 0 again. You can a
lso set this parameter to a specific point in time.
                                    # Life time of relation cache in seconds.
                                    # 0 means no cache expiration(the default).
                                    # The relation cache is used for cache the
                                    # query result against PostgreSQL system
                                    # catalog to obtain various information
                                    # including table structures or if it's a
                                    # temporary table or not. The cache is
                                    # maintained in a pgpool child local memory
                                    # and being kept as long as it survives.
                                    # If someone modify the table by using
                                    # ALTER TABLE or some such, the relcache is
                                    # not consistent anymore.
                                    # For this purpose, cache_expiration
                                    # controls the life time of the cache.
relcache_size = 8192
                                    # Number of relation cache
                                    # entry. If you see frequently:
                                    # "pool_search_relcache: cache replacement happend"
```

```
                                    # in the pgpool log, you might want to increate this number.
```

3. Run the `cd /etc/pgpool-II-12` command to configure the pool_passwd file.

> **Note** If you connect to your ApsaraDB RDS instances by using Pgpool, you must configure the pool_passwd file. This is because Pgpool supports the authentication protocol of PostgreSQL.

```
# Run the following command:
#pg_md5 --md5auth --username=username password
# Generate the passwords of the digoal and nobody users. The passwords are automatically written i
nto the pool_passwd file.
pg_md5 --md5auth --username=digoal "xxxxxxx"
pg_md5 --md5auth --username=nobody "xxxxxxx"
```

4. Use the system to automatically generate the pool_passwd file.

```
cd /etc/pgpool-II-12
cat pool_passwd
```

5. Run the following commands to configure the pgpool_hba file:

```
cd /etc/pgpool-II-12
cp pool_hba.conf.sample pool_hba.conf
vi pool_hba.conf
```

Configure the following parameters:

```
host all all 0.0.0.0/0 md5
```

6. Configure the pcp.conf file.

> **Note** The pcp.conf file is used to manage the users and passwords of Pgpool. It is not related to the users and passwords of your ApsaraDB RDS instances.

```
cd /etc/pgpool-II-12
# pg_md5 abc  # In this command, you set the password to abc and encrypt it by using the MD5 encry
ption algorithm.
900150983cd24fb0d6963f7d28e17f72
cp pcp.conf.sample pcp.conf
vi pcp.conf
# USERID:MD5PASSWD
manage:900150983cd24fb0d6963f7d28e17f72  # In this command, the manage user is used to manage PCP.
```

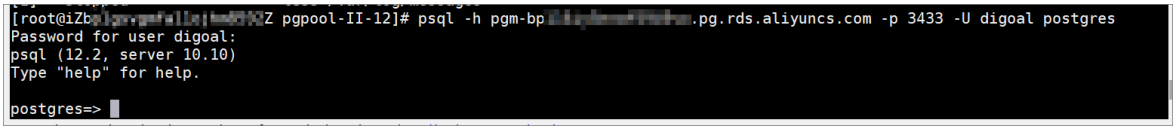
7. Start Pgpool.

```
cd /etc/pgpool-II-12
pgpool -f ./pgpool.conf -a ./pool_hba.conf -F ./pcp.conf
```

> **Note** If you want to view the logs of Pgpool, run the following command:
>
> ```
> less /var/log/messages
> ```

8. Use Pgpool to connect to your ApsaraDB RDS instances.

```
psql -h 127.0.0.1 -p 8001 -U digoal postgres
```



FAQ

- Q: How do I test whether read/write splitting is enabled?

  A: You can connect to your ApsaraDB RDS instances by using Pgpool and call the pg_is_in_recovery() function. Then, close the connection, establish a connection again, and call the pg_is_in_recovery() function again. If you receive a value of false and then a value of true, Pgpool routes requests to your primary ApsaraDB RDS instance and then to your read-only ApsaraDB RDS instances, and read/write splitting is enabled.

- Q: Does Pgpool increase the latency?

  A: Pgpool increases the latency slightly. In the test environment you set up in this topic, the latency increases by about 0.12 milliseconds.

- Q: How does Pgpool check the latency and health on my read-only ApsaraDB RDS instances?
  - A: If the WAL replay latency on a read-only ApsaraDB RDS instance exceeds the specified limit, Pgpool stops routing SQL requests to the read-only instance. Pgpool resumes routing SQL requests to the read-only instance only after it detects that the WAL replay latency on the read-only instance falls below the specified limit.

    > **Note** Connect to your primary ApsaraDB RDS instance and query the location where the current WAL data record is written. This location is referred to as log sequence number (LSN) 1. Then, connect to a read-only ApsaraDB RDS instance and query the location where the current WAL data record is replayed. This location is referred to as LSN 2. You can obtain the number of bytes between LSN 1 and LSN 2. This number indicates the latency.

  - Pgpool monitors the health of your read-only ApsaraDB RDS instances. If a read-only instance is unhealthy, Pgpool stops routing requests to the read-only instance.

- Q: How do I stop Pgpool and reload the configuration of Pgpool?

  A: Run the `pgpool --help` command to obtain more information about the commands used in Pgpool. Example:

  ```
  cd /etc/pgpool-II-12
  pgpool -f ./pgpool.conf -m fast stop
  ```

- Q: How do I configure Pgpool if more than one read-only ApsaraDB RDS instance is attached to my primary ApsaraDB RDS instance?

  A: Add the configurations of all the attached read-only ApsaraDB RDS instances to the pgpool.conf file. Example:

  ```
  backend_hostname1 = 'xx.xx.xxx.xx'
  backend_port1 = 8002
  backend_weight1 = 1
  backend_data_directory1 = '/data01/pg12_8002/pg_root'
  backend_flag1 = 'DISALLOW_TO_FAILOVER'
  backend_application_name1 = 'server1'
  backend_hostname2 = 'xx.xx.xx.xx'
  backend_port1 = 8002
  backend_weight1 = 1
  backend_data_directory1 = '/data01/pg12_8002/pg_root'
  backend_flag1 = 'DISALLOW_TO_FAILOVER'
  backend_application_name1 = 'server1'
  ```

- Q: How do I use pcp commands to view the status of my read-only ApsaraDB RDS instances?

A: To obtain the status of your read-only ApsaraDB RDS instances by using pcp commands, run the following command:

```
# pcp_node_info -U manage -h /tmp -p 9898 -n 1 -v
Password: # Enter the password.
Hostname               : 127.0.0.1
Port                   : 8002
Status                 : 2
Weight                 : 0.500000
Status Name            : up
Role                   : standby
Replication Delay      : 0
Replication State      :
Replication Sync State :
Last Status Change     : 2020-02-29 00:20:29
```

- Q: Which listening ports are used by Pgpool for read/write splitting?

  A: The following listening ports are used by Pgpool for read/write splitting:

  - Primary ApsaraDB RDS instance: Port 3389
  - Secondary ApsaraDB RDS instance: Port 8002
  - Pgpool: Port 8001
  - PCP: Port 9898

11.1.18. Use ShardingSphere to develop ApsaraDB RDS for PostgreSQL

ShardingSphere is an open source ecosystem that consists of a set of distributed database middleware solutions.

Prerequisites

All PostgreSQL versions used with ApsaraDB RDS support ShardingSphere.

Context

ApsaraDB RDS for PostgreSQL supports database-integrated sharding plug-ins (such as Citus, Postgres-XC, and AntDB) and massively parallel processing (MPP) products. It also supports sharding middleware products that are similar to those widely used in MySQL, such as ShardingSphere.

ShardingSphere is suitable for services that run in databases with thorough, well-organized logical sharding. It offers the following features:

- Data sharding
  - Database and table sharding
  - Read/write splitting
  - Sharding strategy customization
  - Decentralized distributed primary key
- Distributed transaction
  - Unified transaction API
  - XA transaction
  - BASE transaction
- Database orchestration
  - Dynamic configuration
  - Orchestration and governance

- Data encryption
- Tracing and observability
- Elastic scaling out (planning)

For more information, visit the ShardingSphere documentation.

ShardingSphere products

ShardingSphere includes three independent products. You can choose the product that best suits your business requirements. The following table describes these products.

Parameter	Sharding-JDBC	Sharding-Proxy	Sharding-Sidecar
Supported database engine	All JDBC-compatible database engines such as MySQL, PostgreSQL, Oracle, and SQL Server	MySQL and PostgreSQL	MySQL and PostgreSQL
Connections consumed	High	Low	High
Supported heterogeneous language	Java	All	All
Performance	Low consumption	Moderate consumption	Low consumption
Decentralized	Yes	No	Yes
Stateless API	No	Yes	No

Prepare configuration templates

1. On your ECS instance, run the following command to go to the directory where configuration templates are stored. The directory is under the root directory in this example.

   ```
   cd /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf
   ```

2. Run the `ll` command to view all files stored in the directory: Command output:

   ```
   total 24
   -rw-r--r-- 1 501 games 3019 Jul 30  2019 config-encrypt.yaml
   -rw-r--r-- 1 501 games 3582 Apr 22  2019 config-master_slave.yaml
   -rw-r--r-- 1 501 games 4278 Apr 22  2019 config-sharding.yaml
   -rw-r--r-- 1 501 games 1918 Jul 30  2019 server.yaml
   ```

   Note
   - config-encrypt.yaml: the data encryption configuration file.
   - config-master_slave.yaml: the read/write splitting configuration file.
   - config-sharding.yaml: the data sharding configuration file.
   - server.yaml: the common configuration file.

3. Modify the configuration files.

Note For more information about the configuration files, visit the ShardingSphere documentation. In this example, the data sharding and common configuration files are used.

- Example of a data sharding configuration file:

```
schemaName: # The name of the logical data source.
dataSources: # The configuration of the data source. You can configure more than one da
ta source by using the data_source_name variable.
  <data_source_name>: # You do not need to configure a database connection pool. This i
s different in Sharding-JDBC.
    url: # The URL used to connect to your database.
    username: # The username used to log on to the database.
    password: # The password used to log on to the database.
    connectionTimeoutMilliseconds: 30000 # The connection timeout period in millisecond
s.
    idleTimeoutMilliseconds: 60000 # The idle-connection reclaiming timeout period in m
illiseconds.
    maxLifetimeMilliseconds: 1800000 # The maximum connection time to live (TTL) in mil
liseconds.
    maxPoolSize: 65 # The maximum number of connections allowed.
shardingRule: # You do not need to configure a sharding rule, because it is the same in
Sharding-JDBC.
```

- Example of a common configuration file:

```
Proxy properties
# You do not need to configure proxy properties that are the same in Sharding-JDBC
props:
  acceptor.size: # The number of worker threads that receive requests from the client.
The default number is equal to the number of CPU cores multiplied by 2.
  proxy.transaction.type: # The type of transaction processed by the proxy. Valid value
s: LOCAL | XA | BASE. Default value: LOCAL. Value XA specifies to use Atomikos as the t
ransaction manager. Value BASE specifies to copy the .jar package that implements the S
hardingTransactionManager operation to the lib directory.
  proxy.opentracing.enabled: # Specifies whether to enable link tracing. Link tracing i
s disabled by default.
  check.table.metadata.enabled: # Specifies whether to check the consistency of metadat
a among sharding tables during startup. Default value: false.
  proxy.frontend.flush.threshold: # The number of packets returned in a batch during a
complex query.
Permission verification
This part of the configuration is used to verify your permissions when you attempt to l
og on to Sharding-Proxy. After you configure the username, password, and authorized dat
abases, you must use the correct username and password to log on to Sharding-Proxy from
the authorized databases.
authentication:
  users:
    root: # The username of the root user.
      password: root# The password of the root user.
    sharding: # The username of the sharding user.
      password: sharding# The password of the sharding user.
      authorizedSchemas: sharding_db, masterslave_db # The databases in which the speci
fied user is authorized. If you want to specify more than one database, separate them w
ith commas (,). You are granted the permissions of the root user by default. This way,
you can access all databases.
```

Set up a test environment

- On your ECS instance, install Java.

```
yum install -y java
```

- Configure an ApsaraDB RDS instance that runs PostgreSQL 10.
  - Create an account with username r1.
  - Set the password of the account to "PW123321!".
  - Create the following databases whose owners are user r1: db0, db1, db2, and db3.
  - Add the IP address of your ECS instance to an IP address whitelist of the ApsaraDB RDS for PostgreSQL instance.

> **Note**
> - For more information about how to create an ApsaraDB RDS for PostgreSQL instance, database, and account, see Create an instance and Create a database and an account.
> - For more information about how to configure an IP address whitelist, see Configure an IP address whitelist.

- Run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml` to configure the following common configuration file:

```
  authentication:
  users:
    r1:
      password: PW123321!
      authorizedSchemas: db0,db1,db2,db3
props:
  executor.size: 16
  sql.show: false
```

Test horizontal sharding

1. Run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/config-sharding.yaml` to modify the following data sharding configuration file:

```
schemaName: sdb
dataSources:
  db0:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db0
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
    maxPoolSize: 65
  db1:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db1
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
    maxPoolSize: 65
  db2:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db2
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
```

```
    maxPoolSize: 65
  db3:
    url: jdbc:postgresql://pgm-bpxxxxx.pg.rds.aliyuncs.com:1433/db3
    username: r1
    password: PW123321!
    connectionTimeoutMilliseconds: 30000
    idleTimeoutMilliseconds: 60000
    maxLifetimeMilliseconds: 1800000
    maxPoolSize: 65
shardingRule:
  tables:
    t_order:
      actualDataNodes: db${0..3}.t_order${0..7}
      databaseStrategy:
        inline:
          shardingColumn: user_id
          algorithmExpression: db${user_id % 4}
      tableStrategy:
        inline:
          shardingColumn: order_id
          algorithmExpression: t_order${order_id % 8}
      keyGenerator:
        type: SNOWFLAKE
        column: order_id
    t_order_item:
      actualDataNodes: db${0..3}.t_order_item${0..7}
      databaseStrategy:
        inline:
          shardingColumn: user_id
          algorithmExpression: db${user_id % 4}
      tableStrategy:
        inline:
          shardingColumn: order_id
          algorithmExpression: t_order_item${order_id % 8}
      keyGenerator:
        type: SNOWFLAKE
        column: order_item_id
  bindingTables:
    - t_order,t_order_item
  defaultTableStrategy:
    none:
```

2. Start ShardingSphere and listen to Port 8001.

```
cd /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/bin/
./start.sh 8001
```

3. Connect to the destination database.

```
psql -h 127.0.0.1 -p 8001 -U r1 sdb
```

4. Create a table.

```
create table t_order(order_id int8 primary key, user_id int8, info text, c1 int, crt_time timestam
p);
create table t_order_item(order_item_id int8 primary key, order_id int8, user_id int8, info text,
c1 int, c2 int, c3 int, c4 int, c5 int, crt_time timestamp);
```

> **Note** When you create a table, the system creates horizontal shards in the destination database based on the sharding strategy that you specify.

FAQ

- If you want to view the SQL parsing and routing statements used in ShardingSphere, run `vi /root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/conf/server.yaml`.

```
  authentication:
  users:
    r1:
      password: PW123321!
      authorizedSchemas: db0,db1,db2,db3
props:
  executor.size: 16
  sql.show: true # Specifies to log parsed SQL statements.
```

- If you want to test writes and queries, run the following commands:

```
insert into t_order (user_id, info, c1, crt_time) values (0,'a',1,now());
insert into t_order (user_id, info, c1, crt_time) values (1,'b',2,now());
insert into t_order (user_id, info, c1, crt_time) values (2,'c',3,now());
insert into t_order (user_id, info, c1, crt_time) values (3,'c',4,now());
select * from t_order;
```

  The following result is returned in this example:

```
      order_id      | user_id | info | c1 |          crt_time
--------------------+---------+------+----+----------------------------
 433352561047633921 |       0 | a    |  1 | 2020-02-09 19:48:21.856555
 433352585668198400 |       1 | b    |  2 | 2020-02-09 19:48:27.726815
 433352610813050881 |       2 | c    |  3 | 2020-02-09 19:48:33.721754
 433352628370407424 |       3 | c    |  4 | 2020-02-09 19:48:37.907683
(4 rows)
```

- If you want to view ShardingSphere logs, run the following command:

```
/root/apache-shardingsphere-incubating-4.0.0-sharding-proxy-bin/logs/stdout.log
```

- If you want to use pgbench for stress testing, run the following commands:

```
vi test.sql
\set user_id random(1,100000000)
\set order_id random(1,2000000000)
\set order_item_id random(1,2000000000)
insert into t_order (user_id, order_id, info, c1 , crt_time) values (:user_id, :order_id,random()::
text, random()*1000, now()) on conflict (order_id) do update set info=excluded.info,c1=excluded.c1,
crt_time=excluded.crt_time;
insert into t_order_item (order_item_id, user_id, order_id, info, c1,c2,c3,c4,c5,crt_time) values (
:order_item_id, :user_id,:order_id,random()::text, random()*1000,random()*1000,random()*1000,random
()*1000,random()*1000, now()) on conflict(order_item_id) do nothing;
pgbench -M simple -n -r -P 1 -f ./test.sql -c 24 -j 24  -h 127.0.0.1 -p 8001 -U r1 sdb -T 120
progress: 1.0 s, 1100.9 tps, lat 21.266 ms stddev 6.349
progress: 2.0 s, 1253.0 tps, lat 18.779 ms stddev 7.913
progress: 3.0 s, 1219.0 tps, lat 20.083 ms stddev 13.212
```

12.Cloud Native Distributed Database PolarDB-X

12.1. User Guide (1.0)

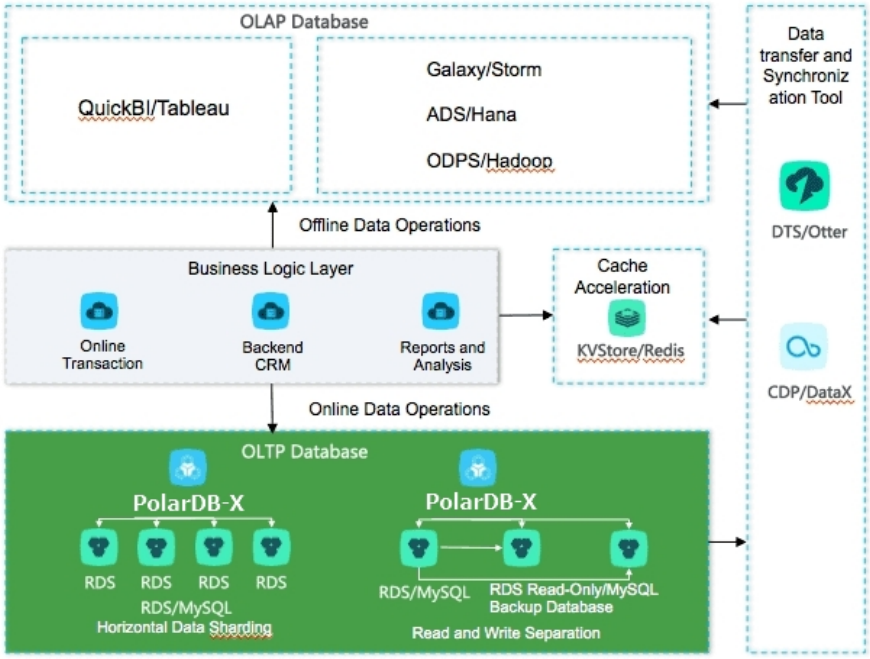
12.1.1. What is PolarDB-X?

is a database product that is developed by Alibaba Group and focuses on scaling out single-instance relational databases. This service is compatible with former Distributed Relational Database Service (DRDS).

Compatible with the MySQL communication protocols, supports most MySQL data manipulation language (DML) and data definition language (DDL) syntax. It provides the core capabilities and features of distributed databases, such as sharding, smooth scale-out, service upgrade and downgrade, and transparent read/write splitting. PolarDB-X is lightweight (stateless), flexible, stable, and efficient, and provides you with O&M capabilities throughout the lifecycle of distributed databases.

is used for operations on large-scale online data. PolarDB-X maximizes the operation efficiency by partitioning data in specific business scenarios. This meets the requirements of online business on relational databases in an effective way.

Figure of the architecture



Fixed issues

- Capacity bottlenecks of single-instance databases: As the data volume and access increase, traditional single-instance databases encounter great challenges that cannot be solved by hardware upgrades in a complete way. In distributed database solutions, multiple instances work in a joint way. This resolves the bottlenecks of data storage capacity and access volumes in an effective way.
- Difficult scale-out of relational databases: Due to the inherent attributes of distributed databases, you can change the shards where data is stored through smooth data migration. This way, the dynamic scale-out of relational databases is achieved.

12.1.2. Quick start

This topic describes how to get started with .

A instance is physically a distributed cluster that consists of multiple server nodes and underlying storage instances. A database is a logical concept and contains only metadata. Specific data is stored in the physical databases of the underlying storage instances. To get started with , perform the following steps:

1. Create a PolarDB-X instance.
2. Create a database.

   To create a database in a instance, you must select one or more ApsaraDB RDS for MySQL instances as the data storage nodes. If no ApsaraDB RDS for MySQL instance exists, create one first. For more information about how to create an ApsaraDB RDS for MySQL instance, see **User Guide > Instance management > Create an instance** in the *ApsaraDB RDS documentation*.
3. After a database is created, you must create tables in the database. This is similar to creating tables in a common standalone database. However, the syntax is different in the expression of data partitioning information in the table creation statement of . For more information about how to create a table, see Table creation syntax.

12.1.3. Log on to the PolarDB-X console

This topic describes how to log on to the console by using Google Chrome.

Prerequisites

- The URL of the Apsara Uni-manager Management Console is obtained from the deployment personnel before you log on to the Apsara Uni-manager Management Console.
- We recommend that you use the Google Chrome browser.

Procedure

1. In the address bar, enter the URL of the Apsara Uni-manager Management Console. Press the Enter key.
2. Enter your username and password.

   Obtain the username and password that you can use to log on to the console from the operations administrator.

   > **Note** When you log on to the Apsara Uni-manager Management Console for the first time, you must change the password of your username. Your password must meet complexity requirements. The password must be 10 to 32 characters in length and must contain at least two of the following character types:
   >
   > - Uppercase or lowercase letters
   > - Digits
   > - Special characters, which include ! @ # $ %
3. Click **Log On**.
4. In the top navigation bar, choose **Products > Database Services > Distributed Relational Database Service**.

12.1.4. Instance management

12.1.4.1. Create an instance

Before you use , create an instance. This topic describes how to create a instance.

1. Log on to the PolarDB-X console.

2. In the upper-right corner of the page, click **Create Instance**.
3. On the **Create PolarDB-X Instance** page, configure the parameters as needed.

   Parameters for creating an instance describes the parameters.

   Parameters for creating an instance

Category	Parameter	Description
Region	Organization	The organization to which the instance belongs.
	Resource Set	The resource set to which the instance belongs.
	Region	The region in which the instance is deployed. The instances in different regions cannot communicate with each other over an internal network. After an instance is created, you cannot change the region for the instance.
	Zone	The zone in which the instance is deployed.
Basic Settings	Instance Type	The type of the instance. Select an instance type from the options that are available on the page.
	Edition	The edition of the instance. Valid values: ○ Standard ○ Enterprise ○ Starter
	Specifications	The specifications of the instance. The specifications vary based on instance editions. Select the instance specifications from the options that are available on the page.
Network Type	Network Type	The network type of the instance. Valid values: ○ **Classic Network**: Cloud services on the classic network are not isolated from each other. Unauthorized access to a cloud service is blocked only by the security group or based on the whitelist policy of the service. ○ **VPC**: You can create a virtual private cloud (VPC) to build an isolated network environment on Apsara Stack. You can customize route tables, IP address ranges, and gateways in a VPC. We recommend that you select a VPC for improved security. If you set Network Type to VPC, you must set **VPC** and **vSwitch**. **Note** The instance and the Elastic Compute Service (ECS) instance to connect must use the same network type. Otherwise, they cannot communicate with each other over an internal network.
	VPC	Select a VPC. **Note** If you set **Network Type** to **VPC**, specify this parameter.
	vSwitch	Select a vSwitch in the VPC. **Note** If you set **Network Type** to **VPC**, specify this parameter.

4. Click **Submit**.

   After the instance is created, the instance appears in the instance list and the status of the instance changes to **Running**. The instance name is a unique identifier of an instance. You can identify a instance based on this unique identifier.

12.1.4.2. Change instance specifications

When you use , you can change the specifications of a instance as needed.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the **Common Actions** section or the **Configuration Information** section, click **Upgrade** or **Downgrade** to go to the Change Specifications page.

   > **Note** Alternatively, on the **DRDS Instance Management** page, choose **More > Downgrade** in the **Actions** column of the instance.

5. On the Change Specifications page, set **Instance Edition** and **Instance Specifications**, and click **Submit**.

   After a few minutes, you can view the new specifications of the PolarDB-X instance in the instance list.

   > **Note** Specifications downgrade leads to transient disconnections between applications and within a short period of time. Make sure that your applications can be automatically reconnected.

12.1.4.3. Create a non-integrated PolarDB-X instance

This topic describes how to create a non-integrated instance.

Context

instances are divided into integrated instances and non-integrated instances. The following list describes the differences between integrated instances and non-integrated instances:

- Integrated instances are instances that are integrated with the resource pool of ApsaraDB RDS for MySQL. You can manage your dedicated ApsaraDB RDS for MySQL instances in the console.
- Non-integrated instances are the ApsaraDB RDS for MySQL instances that are purchased in the ApsaraDB RDS console and added to the console. ApsaraDB RDS for MySQL instances must be managed in the ApsaraDB RDS for MySQL console.

is integrated with ApsaraDB RDS in and Apsara Stack Enterprise Edition V3.11 hot-feature and later. By default, all instances created in the PolarDB-X console are integrated instances. Apsara Stack provides an entry point that allows you to create non-integrated instances.

Operation notes

When you create a non-integrated PolarDB-X instance, you may need to pull an image. In this case, if an error such as a pull timeout occurs, you can contact Alibaba Cloud technical support.

Procedure

Contact Alibaba Cloud O&M personnel for assistance.

12.1.4.4. Read-only PolarDB-X instances

12.1.4.4.1. Overview

Read-only instances are an extension and supplement to primary instances and are compatible with SQL query syntax of primary instances.

Features

Read-only and primary instances can share the same replica of data. You can perform complex data query and analytics on read-only or primary ApsaraDB RDS for MySQL instances. Multiple instance types are provided to handle highly concurrent access requests and reduce the RT for complex queries. Read-only PolarDB-X instances provide resource isolation, which alleviates the load pressure on the primary PolarDB-X instances and reduces the link complexity of the business architecture. No additional data synchronization operations are required, and the O&M and budget costs are reduced.

Instance types

Concurrent read-only instances: For high-concurrency and high-traffic simple queries or offline data extraction, resource isolation helps you handle highly concurrent queries. This way, the stability of online business links is ensured.

> **Note** For the business for which primary instances are used, concurrent read-only instances can be used in the following scenarios:
>
> - High-concurrency and high-traffic simple queries are performed.
> - Data is extracted offline.

Limits

- Primary and read-only instances must be in the same region, but they can be in different zones.
- A read-only instance must belong to a primary instance. Before you create a read-only PolarDB-X instance, you must create a primary PolarDB-X instance. After you create a database on the primary instance, the database is replicated to the read-only instance. If you delete the database from the primary instance, the corresponding database on the read-only instance is also deleted.
- You are not allowed to migrate data to read-only instances.
- You are not allowed to create databases in or delete databases from read-only instances.
- Read-only instances cannot be cloned.
- Read-only instances support DDL statements but do not support DML statements for data modification.

12.1.4.4.2. Create a read-only PolarDB-X instance

This topic describes how to create a read-only PolarDB-X instance.

Procedure

1. Log on to the PolarDB-X console.
2. In the instance list, find the primary PolarDB-X instance for which you want to create a read-only instance.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. Click **Read-only Instance** on the right of the primary instance.
5. Specify Region, Basic Settings, and Network Type. Then, click **Submit**.

   Parameters for creating a read-only PolarDB-X instance

Section	Parameter	Description
Region	**Region**	The region where the instance is deployed. PolarDB-X instances in different regions cannot communicate with each other. After a PolarDB-X instance is created, the region cannot be changed.
	Zone	The zone where the PolarDB-X instance is deployed.
Basic Settings	**Instance Type**	The type of the read-only PolarDB-X instance. Select an instance type from the options that are available on the page.
	Instance Edition	The edition of the instance. Valid values: ○ Starter ○ Standard ○ Enterprise
	Instance Specifications	The specifications of the instance. The specifications vary based on instance editions. Select the instance specifications from the options that are available on the page.
	Describe	The description of the read-only PolarDB-X instance. We recommend that you provide an informative description to simplify future management operations.
Network Type	**Network Type**	The network type of the PolarDB-X instance. instances support the following network types: ○ **Classic Network**: Cloud services in the classic network are not isolated from each other. Unauthorized access to a cloud service can be blocked only by the security group or the whitelist policy of the service. ○ **VPC**: You can create a virtual private cloud (VPC) to build an isolated network environment on Apsara Stack. You can customize route tables, IP address ranges, and gateways in a VPC. We recommend that you select VPC for higher security. Select VPC for Network Type and then specify **VPC** and **vSwitch**. **Note** Make sure that the instance has the same network type as the Elastic Compute Service (ECS) instance to which you want to connect. If the PolarDB-X and ECS instances have different network types, they cannot communicate over an internal network.

6. It takes several minutes to create the instance. Wait until the instance is created. After the instance is created, it appears in the instance list in the console.

12.1.4.4.3. Manage a read-only PolarDB-X instance

Read-only instances are managed in a similar way as primary instances. However, databases cannot be created or deleted on the read-only instance management page. Databases on read-only instances are created when databases on primary instances are created. Databases on read-only instances are deleted when databases on primary instances are deleted. In the console, you can go to the read-only instance management page in two ways.

Manage a read-only PolarDB-X instance by its ID

1. Log on to the PolarDB-X console.
2. On the **PolarDB-X Instance Management** page, find the read-only instance that you want to manage.
3. Click the instance ID or choose **More > Manage** from the Actions column of the read-only instance that you

want to manage to access the **Basic Information** page.

Manage a read-only PolarDB-X instance by the ID of its primary instance

1.
2. On the **DRDS Instance Management** page, find the primary instance to which the read-only instance belongs.
3. Click the ID of the primary instance or choose **More > Manage** from the Actions column of the primary instance to access the **Basic Information** page.
4. On the **Basic Information** page, move the pointer over the number of read-only instances in the **Related Instances** section to view the ID of the read-only PolarDB-X instance.
5. Click the ID of the read-only PolarDB-X instance. The **Basic Information** page of the read-only instance appears.

12.1.4.4.4. Release a read-only PolarDB-X instance

If you no longer need a read-only instance, you can release it.

Prerequisites

The read-only instance must be in the **Running** state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.

   Notice You cannot recover the PolarDB-X instances that have been released. Exercise caution when you perform this operation.

4. In the **Release DRDS Instance** dialog box, click **OK**.

12.1.4.5. Restart a PolarDB-X instance

This topic describes how to restart a instance.

Prerequisites

The PolarDB-X instance must be in the **Running** state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. Click **Restart Instance** in the upper-right corner.
5. In the **Restart Instance** dialog box, click **OK**.

   Notice Restarting a PolarDB-X instance terminates all its connections. Make appropriate service arrangements before you restart a PolarDB-X instance. Exercise caution when you perform this operation.

12.1.4.6. Release a PolarDB-X instance

This topic describes how to release a running PolarDB-X instance in the console.

Prerequisites

- All databases on the PolarDB-X instance have been deleted.
- The PolarDB-X instance must be in the Running state.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. In the PolarDB-X instance list, find the target instance, and choose **More > Release** from the Actions column.
4. In the **Release DRDS Instance** dialog box, click **OK**.

> **Warning** After the PolarDB-X instance is released, data is not deleted from its attached ApsaraDB RDS for MySQL instances. However, a released PolarDB-X instance cannot be restored. Exercise caution when you perform this operation.

12.1.4.7. Recover data

12.1.4.7.1. Backup and restoration

allows you to back up data of instances and databases, and restore them by using the backup data. Instances can be automatically and manually backed up. PolarDB-X provides fast backup and consistent backup. Existing backup sets are used to restore data in instances. Data is restored to the new and ApsaraDB RDS for MySQL instances based on the existing backup sets.

Considerations

- By default, the automatic backup policy of is disabled. You must manually enable it.
- The log backup capability of depends on underlying ApsaraDB RDS for MySQL instances. Therefore, the log backup policy configured in the console is automatically synchronized to all the underlying ApsaraDB RDS for MySQL instances. After the policy is configured, do not modify it in the ApsaraDB RDS for MySQL console. Otherwise, relevant data backup sets become invalid.
- The backup and restoration feature of depends on log backup. We recommend that you enable the log backup policy by default to prevent backup sets from becoming invalid.
- Data definition language (DDL) operations cannot be performed during the backup process. Otherwise, instance backup and restoration fail.
- During the backup, make sure that the underlying ApsaraDB RDS for MySQL instances for the instance are normal to prevent backup failures.
- Consistent backup and restoration is supported only in 5.3.8 and later.
- All the tables must have primary keys to ensure data accuracy during consistent backup and restoration.
- During consistent backup, distributed transactions on instances are locked for seconds. During the locking period, non-transactional SQL statements and non-distributed transactions can be run as expected. However, the commitment of distributed transactions is blocked and the response time (RT) for executing SQL statements may have millisecond-level jitters. We recommend that you perform consistent backup during off-peak hours.
- Due to changes in the inventory of and ApsaraDB RDS for MySQL, automatically adjusts the instance type and zone during instance restoration. We recommend that you confirm and adjust the instance type and zone after the instance restoration to avoid business disruption.

Backup methods

In different scenarios, provides fast backup and consistent backup and the related data restoration capabilities. The following table compares the two backup methods.

Backup method	Scenario	Advantage	Disadvantage
Fast backup	Applies to routine backup and restoration scenarios.	• It provides fast data backup and restoration. • It supports restoration at a point in time based on backup sets. • It supports all the instance versions.	It ensures data consistency only within a single ApsaraDB RDS for MySQL instance in sharding scenarios. However, it does not ensure global data consistency.
Consistent backup	It applies to backup and restoration for the financial industry and online core transactions that require high data consistency.	It ensures global data consistency in sharding scenarios.	• It features slow backup and restoration. • It supports data restoration by backup set but does not support restoration by time. • It is supported only in 5.3.8 and later. • During data backup, distributed transactions on instances are locked for seconds. During the locking period, the response time (RT) for executing SQL statements may have millisecond-level jitters. Therefore, we recommend that you perform consistent backup during off-peak hours.

12.1.4.7.2. Configure an automatic backup policy

provides the automatic backup feature. This topic describes how to configure an automatic backup policy.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. Click the **Backup Policy** tab and then click **Edit**.
6. In the **Backup Policy** dialog box, set parameters based on the business requirements, and click **OK**.

> **Notice** instances cannot back up logs. The configured log backup policy is applied to all the underlying ApsaraDB RDS for MySQL instances.

12.1.4.7.3. Configure local logs

You can use local logs and the backup and restoration feature or the SQL flashback feature of to accurately restore an instance or a database to the desired point in time. This topic describes how to configure local logs.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. Click the **Local Log Settings** tab and then click **Edit**.
6. In the **Local Binlog Settings** dialog box, specify the parameters based on the business requirements and click **OK**.

> **Notice** The local log settings are applied to all the underlying ApsaraDB RDS for MySQL instances.

12.1.4.7.4. Manual backup

In addition to automatic backup, also provides manual backup, which allows you to back up data at any time. This topic describes how to manually back up instances and databases.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Backup** on the right.
6. In the dialog box that appears, set Backup Method and Backup Level.
   - Backup Method can be set to **Fast Backup** or **Consistent Backup**. For more information about the differences between the two methods, see Backup methods.

     > **Notice** If you select Consistent Backup, distributed transactions are locked for seconds and the RT may have sub-second-level jitters. Therefore, we recommend that you perform consistent backup during off-peak hours.

   - Backup Level can be set to **Instance Backup** or **Database Backup**. You can select **Instance Backup** to back up the entire instance, or select **Database Backup** to back up a database as needed.
7. Click **OK**.

12.1.4.7.5. Restore data

You can use the data restoration feature of to restore an instance or a database to the time when the backup is created. You can perform this operation anytime. This topic describes how to restore the data of an instance or a database to a specific point in time.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the

Basic Information page.

4. In the left-side navigation pane, choose **Data Recovery > Backup and Recovery**.
5. On the page that appears, click **Data Recovery (Original Clone Instance)** on the right.
6. Select a restoration method.
   - **By Time**: Restore data to the selected point in time. You must specify **Restoration Time** and **Recovery Level**.

     > **Note** Only non-integrated instances support recovery **By Time**. For information about how to create a non-integrated instance, see Create a non-integrated PolarDB-X instance.

   - **By Backup Set**: Restore data from the selected backup file.

     > **Note** You can also click **Recover** in the Actions column of the backup set to restore data **by backup set**, as shown in the following figure.

7. Click **Precheck** to check whether a valid backup set is available for data restoration. If the precheck fails, the data cannot be restored.
8. Click **Enable** to go to the **Confirm Order** page.
9. Confirm the order details and click **Enable** to restore the data. You can view the data restoration progress in **Task Progress** in the upper-right corner of the page.

12.1.4.7.6. SQL flashback

12.1.4.7.6.1. Overview

provides the SQL flashback feature to recover data of particular rows.

When you mistakenly run an SQL statement such as INSERT, UPDATE, or DELETE on , provide the relevant SQL information to match the event in the binary log file and generate the corresponding recovery file. You can download the file and recover data as needed. SQL flashback automatically chooses **fuzzy match** or **exact match** to locate lost data caused by the error. For more information, see Exact match and fuzzy match and Rollback SQL statements and original SQL statements.

Features

- Easy-to-use: SQL flashback allows you to retrieve the lost data by entering required information about the corresponding SQL statement.
- Fast and lightweight: Regardless of the backup policy of ApsaraDB RDS for MySQL instances, you only need to enable log backup before an SQL statement error occurs.
- Flexible recovery: Rollback SQL statements and original SQL statements are available for different scenarios.
- Exact match: SQL flashback supports exact match of data about the corresponding SQL statement, which improves precision of data recovery.

Limits

- SQL flashback depends on the binary log retention time and the log backup feature of ApsaraDB RDS for MySQL must be enabled. Binary log files can be retained only for a certain period. Use SQL flashback to generate files for recovery as soon as possible when an error occurs.
- The recovery files generated by SQL flashback are retained for seven days by default, and you need to download these files as soon as possible.
- The following conditions must be met for SQL flashback exact match:
  - The instance version is 5.3.4-15378085 or later.
  - The version of the ApsaraDB RDS for MySQL instance used by the database is 5.6 or later.

- SQL flashback exact match is enabled before the error SQL statement is executed.
- The TRACE_ID information for the error SQL statement is provided.

- To ensure the precision of data recovery, the exact match feature is enabled by default for the database created in a instance of 5.3.4-15378085 or later. After this feature is enabled, SQL execution information is included in the binary log file by default, which requires more storage space for ApsaraDB RDS for MySQL instances. If you need to use the exact match feature, we recommend that you upgrade before enabling the feature. For more information, see Enable exact match.

12.1.4.7.6.2. Generate a restoration file

This topic describes how to generate a restoration file in the PolarDB-X console.

Procedure

1. Log on to the PolarDB-X console.
2. Find the target instance in the instance list.
3. Click the target instance ID or choose **More > Manage** from the Actions column of the instance to access the **Basic Information** page.
4. In the left-side navigation pane, choose **Data Recovery > SQL Flashback**. The **SQL Flashback** page appears.
5. On the **SQL Flashback** page, enter the basic information about an incorrectly executed SQL statement, including Database, Time Range, Table Name, TRACE_ID, and SQL Statement Type. The following table describes the parameters.

Parameter	Description
Database	The database where the SQL statement was incorrectly executed.
Time Range	The time range during which the SQL statement was incorrectly executed. The beginning of the time range is earlier than the time when the SQL statement starts to be executed. The end of the time range is later than the time when the SQL statement execution ends. To ensure efficient restoration, we recommend that you limit the time range to 5 minutes.
Table Name	The name of the table on which the SQL statement was incorrectly executed. This parameter is optional.
TRACE_ID	The unique TRACE_ID that allocates for each executed SQL statement. You can obtain the TRACE_ID of the incorrectly executed SQL statement by using the SQL audit feature of .
SQL Statement Type	The type of the incorrectly executed SQL statement. Valid values: ○ INSERT ○ UPDATE ○ DELETE

6. Click **Precheck**. The system checks whether a binary log file exists within the specified time range. For more information about binary log files, see Configure local logs.

> **Note**
> - If no binary log file exists within the specified time range, the precheck fails and the system cannot restore the data for you.
> - If a binary log file exists within the specified time range, the precheck is successful and you can proceed to the next step.

7. Set SQL Statement Type for Recovery to **Rollback SQL** or **Original SQL Statement**. For more information about the differences between the two types, see Rollback SQL statements and original SQL statements.
8. Click **Generate SQL** to generate an SQL flashback task. The status of the SQL flashback tasks that are running on the current instance appears in the lower part of the page.

What's next

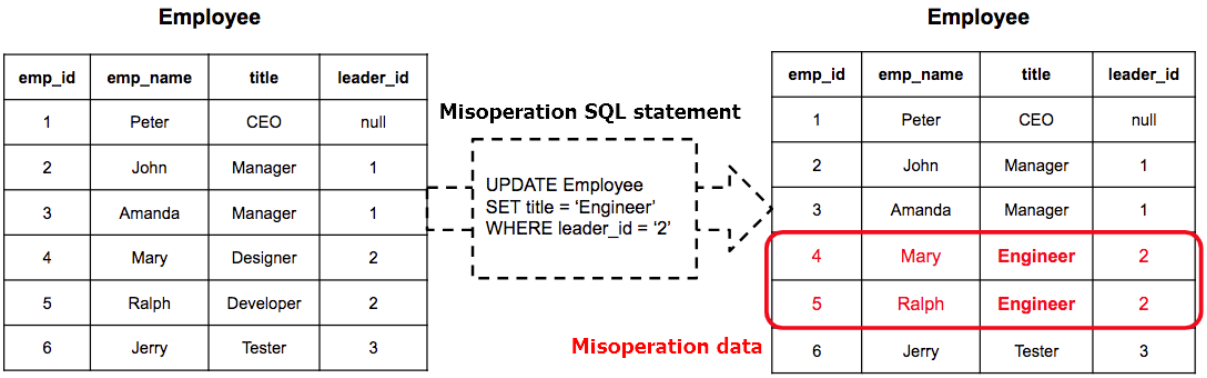
After an SQL flashback task is complete, the task information, such as the exact match status and the number of recovered rows, appears. You can click **Download** in the Actions column of the SQL flashback task to download the corresponding restoration file.

> **Notice** By default, the restoration file is retained for seven days. Download the file at the earliest opportunity.

12.1.4.7.6.3. Rollback SQL statements and original SQL statements

To support different business scenarios, SQL flashback provides rollback SQL statements and original SQL statements. Before generating an SQL statement for recovering data, you must select a corresponding recovery method based on your scenario.

Recovery methods



Recovery method	Description	Example
Rollback SQL statement	Traverses the events in the binary log file in reverse order to reverse the INSERT, UPDATE, and DELETE events. • The reverse of INSERT is equivalent to DELETE. • The reverse of DELETE is equivalent to INSERT. • The reverse of UPDATE is equivalent to the value before UPDATE.	UPDATE Employee SET title = 'Developer' WHERE emp_id = '5' UPDATE Employee SET title = 'Designer' WHERE emp_id = '4'

Recovery method	Description	Example
